Oneida Community Dispersal

FIFTY DAUGHTERS OF
Ormsby Lilith Clothilde

Is from the same dam as King Segis Pontiac Count and by the same sire as Ormsby Korndyke Lad.

160 Head

Syracuse April 12-13

ONYX PLEDGE RELIANCE as a 2-year-old has 10,000 lbs. milk in the first six months. Her dam has 1,100 lbs., strictly official.

ONYX LILITH. Her dam has 1,100 lbs. butter and 26,900 lbs. milk, strictly official. An Ormsby daughter.

This is a complete dispersal of the Oneida Community herd. One hundred sixty head, approximately one hundred thirty-five of which are females and includes fifty daughters of Ormsby Lilith Clothilde.

Both long and short time work has had attention in this herd and while very creditable 7-day records have been made, we have given more attention to the ability of the cow to produce throughout the year, because the Oneida Community herd was established for the purpose of supplying our employees with a high grade of milk and we demanded a cow that could stick to it for a year.

The herd has been shown with good results. At the New York State Fair in 1920 in addition to capturing the junior female championship and first get of sire, they also won second place on 3-year-old bull, first and fourth prize 3-year-old cow, second prize junior and senior yearling, first and second senior heifer calf, first young herd and third produce of dam.

A feature of the sale will be the Onyx and Jennie Grant families, the former headed by Onyx Pledge Dawning, a 32-lb. cow that made over 1,100 lbs. butter and 26,900 lbs. milk in a year, strictly official; the latter headed by Jennie Grant De Kol 2d that has just finished her year with over 23,000 lbs. milk and produced the junior champion female at the 1920 New York State Fair.

In the Onyx family are five daughters of the old cow, two of them twins sired by the Ormsby bull. Another of the daughters as a 2-year-old has produced over 10,000 lbs. milk in the first six months of her year. This is a marvelous family for someone.

The Jennie Grant family includes the foundation cow, two daughters and a granddaughter.

We are proud of both these families.

The fifty daughters of Ormsby Lilith Clothilde with their sire present one of the greatest opportunities Holstein breeders have had in some time. This bull sired the first prize get of sire at the 1920 New York State Fair. His offspring are very uniform, growthy, splendid individuals and with the breeding they have ought to become producers of merit. His two nearest dams are both semi-official cows and many of the dams of the heifers have completed yearly records. Those who are looking for a great sire or a large number of daughters of any one bull will find these to their liking.

Every animal in the sale will be represented to the public exactly as the animal is known to be. Buyers can attend the sale and purchase with the full knowledge of securing an animal just as it is represented.

The Oneida Community is a working herd. It was established to produce milk and we have aimed to breed milk producers. The man who wants to buy good individual, persistent producing, well bred animals that are as free from any infectious disease as is humanly possible to determine, should attend this sale.

JENNIE GRANT AAGGIE, a maternal sister to the junior champion at the 1920 New York State Fair.

LILITH ONYX. Her dam has 1,100 lbs. butter and 26,900 lbs. milk, strictly official. An Ormsby daughter.

ONYX PLEDGE ALMA. Her dam has over 1,100 lbs. butter and 26,900 lbs. milk, strictly official.

JENNIE GRANT LILITH, junior champion at the 1920 New York State Fair. An Ormsby daughter.

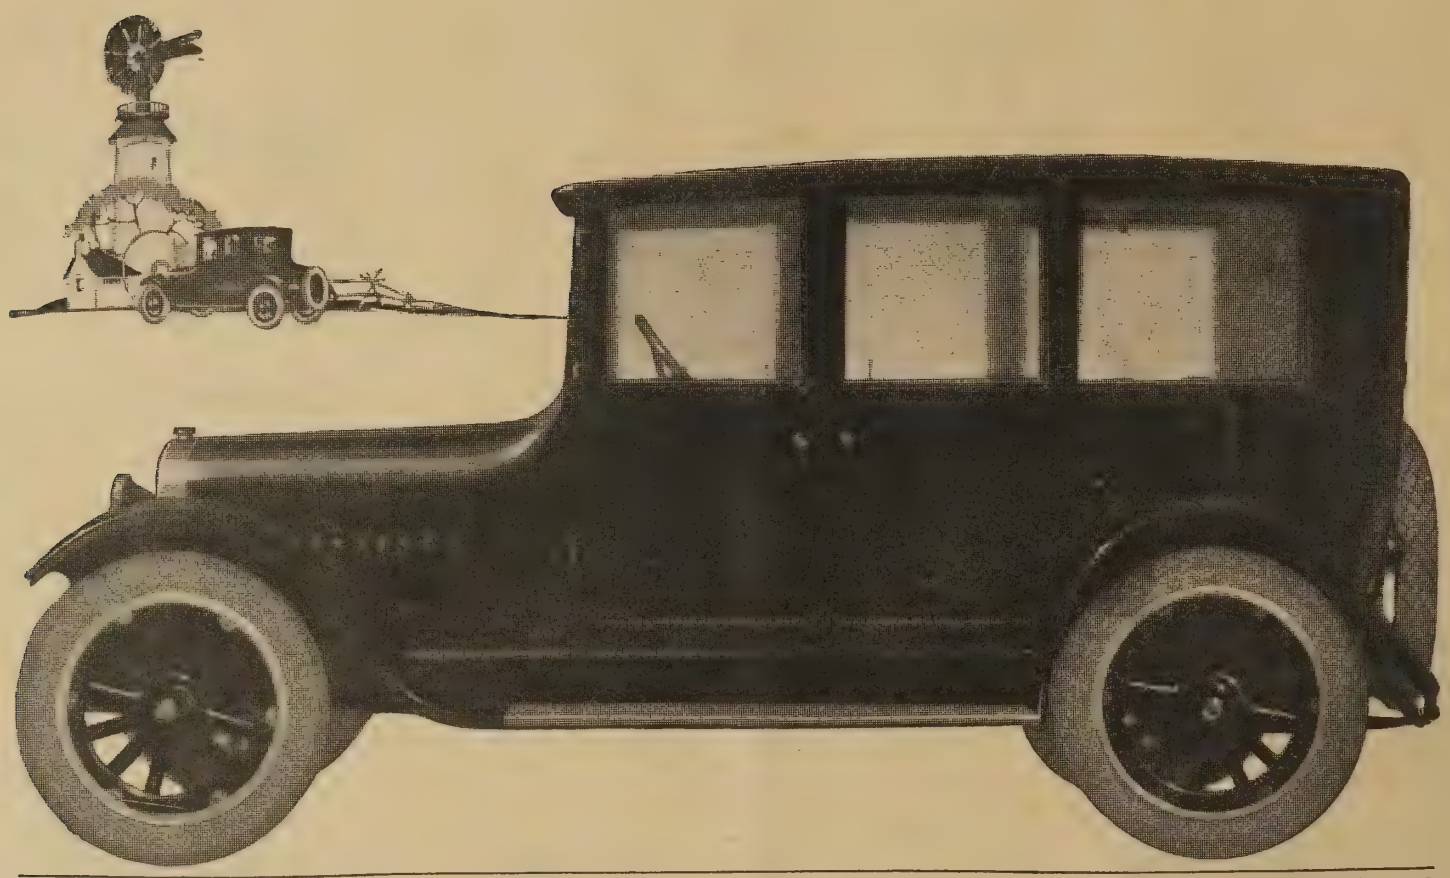
Guaranteed Under Retest Wherever They Go

Arrange Your Sale Trips to Include This One

A DISPERSAL OF A REALLY GREAT HERD

Several of the daughters of Ormsby Lilith Clothilde have been crossed with Dutchland Colantha and Colantha Aaggie Clothilde, both sons of the famous Colantha Johanna Lad and from noted dams. There will be several cows with records up to 29 lbs. in 7 days, and daughters of dams up to 37 lbs.

The Catalog is Ready



LIVERPOOL SALE & PEDIGREE CO.

Liverpool, New York

One of the attractive features will be a young son of the great foundation cow, Onyx Pledge Dawning with a strictly official yearly record of 1,127 lbs. butter and 26,900 lbs. milk. This calf is sired by Ormsby Lilith Clothilde, his dam with over 1,000 lbs. butter and 22,000 lbs. milk. This calf, just a youngster, ought to be placed in some prominent herd. The Onyx family is one of the greatest we have owned, as buyers will appreciate when they see them in the sale ring.

Oakland

OAKLAND OWNERS REPORT RETURNS OF FROM
18 TO 25 MILES PER GALLON OF GASOLINE
AND FROM 8,000 TO 12,000 MILES ON TIRES

THIS OAKLAND SENSIBLE SIX SEDAN IS POWERED WITH THE FAMOUS 44-HORSEPOWER, OVERHEAD-VALVE OAKLAND ENGINE

YOU cannot justly judge the present Oakland by its purchase price alone. The car embodies far more than this moderate figure can possibly indicate. Its powerful six-cylinder, overhead-valve engine, its strong yet lightweight construction, the pronounced economy of its operation—these, and such as these, are the true index of its worth.

OPEN CAR, $1395; ROADSTER, $1395; FOUR DOOR SEDAN, $2065; COUPE, $2065

A De Laval will bring prosperity to your farm

A De Laval Cream Separator saves and serves twice a day, every day in the year. It is the producer of a steady, never-failing cash income during every month, regardless of season or weather.

Its saving of butter-fat alone is so great that the De Laval pays for itself in a short time and then the extra profit is yours—to provide more comforts and conveniences, to buy new stock or equipment, or to save.

The De Laval Separator eliminates the drudgery of gravity skimming. It saves the cream wasted by an inefficient separator, and it lasts a lifetime. It is the most economical separator to buy. That's why there are more than 2,500,000 De Lavals in daily use the world over.

Sold only through agents, to insure you satisfactory service during the life of your machine.

See your De Laval agent now about getting a new De Laval. Furnished in a variety of sizes, in hand, power or electric drives.

THE DE LAVAL SEPARATOR COMPANY

NEW YORK 165 Broadway **CHICAGO** 29 E. Madison Street **SAN FRANCISCO** 61 Beale Street

Sooner or later you will use a De Laval Cream Separator or Milker

The World's Largest Hay Market

The Story of Hay From Producer to Consumer—Valuable Lessons for Buyers and Sellers of Hay

SANDERS SOSLAND, MISSOURI

THE evolution of the hay market of Kansas City is synonymous with the evolution of the forage producing and distributing industry of the United States. The industry was developed around Kansas City, which now ranks as the world's largest market in the distribution of alfalfa, prairie, and other varieties of hay. It is the primary market to which thousands of dairymen in various parts of the United States look for their requirements of the "wonder plant", alfalfa; also, where thousands of producers turn for the most profitable outlet for the hay for which they have no consumptive outlet in their immediate vicinity.

An indication of the remarkable growth of the hay market in Kansas City is the fact that a total of 46,559 cars of hay were actually received and handled there in 1920, establishing a new record for that or any other terminal. Twenty years ago the annual arrivals of hay in Kansas City were less than 15,000 cars. In addition to the hay actually received in Kansas City, the dealers operating on that market handled approximately 50,000 cars in 1920 which they sold direct from producing to consuming sections.

Most of the hay received and distributed by Kansas City dealers is made up of alfalfa shipped from Kansas, Nebraska, Oklahoma, Colorado, Idaho, Utah, Wyoming, Nevada, New Mexico, Arizona, and other western producing states. In the past year alfalfa receipts made up more than half of the total arrivals, 24,479 cars being received, by far the largest twelve-month total. Alfalfa has made the most remarkable progress as a commercial product. In the preceding year only 17,676 cars were received in Kansas City, and in 1907 only 2,841 cars. Only twenty-three years ago the first car of alfalfa was received in Kansas City, which was the first car of the legume handled as a commercial product. The great enlargement in the movement of alfalfa also is a clear index of the remarkable growth of the dairy industry of the United States.

In the period during which alfalfa has broadened both in production and consumption, there has been a serious slump in prairie, due largely to the shrinkage in the number of horses in cities which are being replaced by the automobile and motor truck. In 1912, for example, Kansas City received more than 20,000 cars of prairie and only 8,000 cars of alfalfa; last year the prairie arrivals aggregated only 13,967 cars.

Locating a Commission House

I have been requested by a reader of Hoard's Dairyman to give a detailed description of the Kansas City hay market, and to trace the hay from the producer to the final consumer, also "to give all the information one should know if he had hay to sell or wanted to buy on order from the market," as the subscriber wrote.

For the producer with a surplus stock of hay the first question, of course, is to locate a reliable commission firm to handle the hay. In Kansas City an organization known as the Kansas City Hay Dealers' Association, generally recognized as one of the most powerful bodies of business men in the country, controls the sale of forage. Merchants who sell hay in Kansas City must be members of the organization if they operate on the so-called team tracks where the hay is handled. Each member must be thoroughly reliable and strong enough financially to take care of and protect his customers. The association maintains a very careful watch on its members, too.

Thus, a dealer who is a member of the association is located. As a rule the dealer keeps his customers posted on market conditions, the outlook for prices, demand, and supply, often suggesting the time for shipment, and even advising at times the quality of hay which should be shipped, whether fine, leafy hay or medium green or coarse grade, depending on the trade.

Baling and Loading Hay

The hay, of course, must be well baled—the better the baling the higher is the commercial value of the hay—and then loaded on cars. Incidentally, there is need for far greater care and caution in loading hay than now generally practiced by shippers. Hay should be loaded on edge, not flat, and the car should not be loaded too heavily. There is a tendency to load the bales flatwise and crowd the cars, owing to the high freight charges, but heating in transit often results, particularly if the hay is not thoroughly dried before loading. Loading on edge permits the free circulation of air through the car while in transit.

Plugging the Cars for Inspection

Cars loaded with hay are switched to team tracks maintained exclusively for the handling or inspection and sale of forage, these tracks in Kansas City providing for the handling of at least 400 cars daily, with facilities, of course, for plugging. In plugging the hay, which is one of the requirements of the Kansas City Hay Dealers' Association, 45 to 60 bales are removed from every car, these bales being taken out from each side of the car to allow complete inspection of the contents. Not alone is the hay actually plugged available for thorough inspection, but prospective buyers can go through the car and inspect every bale.

Such inspection is the outcome of practices by some "slick" shippers in loading very poor hay in the ends of the car and excellent colored hay along the doors. Car door inspection is now obsolete in Kansas City. After cars are plugged, the chief inspector of the association, V. K. Spellman, next "makes the rounds" of the team tracks estimating the grade of the contents of the cars. Often, if there is a musty or unusual odor or any unusual condition, the inspector turns over many bales to arrive at his grading. As to the grading ability of the inspector, re-inspection is called upon an average of only one car in 5,000. The inspection committee of the association, therefore, is the most inactive group in the organization.

Buyers walk along the tracks and inspect the plugged bales and the contents of the plugged cars. They seldom buy according to the grade established by the inspector, for the buyers are thorough students of quality and they usually know the character and type of hay demanded by customers. One customer may require fine leafy alfalfa and he is willing to pay a premium for such hay, another may call for sound, brown alfalfa, possibly brown and coarse alfalfa for milling into alfalfa meal. When a car is found meeting the requirements of their orders, trading is begun. Possibly the seller has several prospective buyers and bids for the same car, and the pro-

(Continued on page 464)

THE KANSAS CITY HAY MARKET

Plugged cars of hay on one of the tracks of the Kansas City market awaiting buyers. The buyers, as well as the official inspector, can enter each car to inspect the contents carefully and at the same time examine the plugged bales. Kansas City has tracks with a capacity of 700 cars set aside for its hay business. The negro workers plug the cars and reload the half after its inspection and sale. The first car at the left was graded "standard alfalfa" by Inspector V. K. Spellman, Secretary of the Kansas City Hay Dealers' Association.

Some Effects of Deep Plowing

J. L. JUSTICE, INDIANA

DOES a farmer get any better yields or derive any advantages through deeper plowing brought about in farming with a tractor? That was a question we discussed one day at a local meeting of tractor owners who had come together to discuss problems of farming with a tractor. Deeper plowing is one of the advantages claimed for tractors by most manufacturers and, while claims may be drawn pretty strongly by many agents for tractors, there is plenty of testimony from the real farmers who farm with their own tractors to prove that some advantages are derived from deeper plowing than is usually done with horses.

Here on our farm we used to plow from five to seven inches deep before we bought a tractor. We usually plowed deeper for corn and potatoes than for other crops because we knew better results were always secured from the deeper plowing. Where ground was plowed from four to five inches deep for corn, difficulties were met all during the season and it seemed that the yields were invariably lower. I have no data to prove the

Moderately deep plowing has made this hill land more permeable, less likely to erosion, and capable of making a splendid seedbed.

statement, but I could detect the difference in growth of the crops and their reduced yield.

The tractor has made a difference in the depth of cut made in our plowing. The depth ranges from nothing to two inches deeper than with the horse drawn plows. That there are advantages gained in the deeper plowing is easily noted and that such advantages lead to a better yield is readily apparent. In the first place, the slice of dirt turned over is large and as it is shoved over into the furrow its great bulk tends to reduce it to a looser condition because of the greater friction between its particles. It settles more solidly and completely into the furrow, making a closer contact with the soil below and about it so that capillary movement of the moisture in the soil is not greatly retarded if at all. The loose, moist condition is useful in hastening the decomposition of manures and all humus forming material in the form of vegetable growth. Since the tractor travels a little faster than horses, the plows handle the slice of dirt a little more violently, helping also to reduce it to a finer state when it is turned over. A thin slice of dirt or sod is usually rolled up on the mould board of the plow and turned over in chunks or in a more compact mass.

Many good farmers have been led to buy tractors because they believed they could do a better job of plowing. I have heard a number of experienced farmers remark at tractor demonstrations and in our fields that the tractor plows were doing as good or better work than they had been able to do with horses. A good many feel that the principle reason for the better plowing done by tractors is due to the fact that deeper plowing is generally done with the tractor. I have seen some farmers put on heavy horses, set their plows down and do just as good plowing as any man could do with a tractor, but such cases are the exception, not the rule. The man who has a tractor generally has sufficient reserve power in his machine to pull his plow as deep as he wishes and not feel so much sympathy for his "horses".

Sometimes I have felt that tractor owners occasionally overdo this business of deeper plowing. Perhaps

No sods turned up here when disc harrow was put on, and did you ever see a meadow plowed any finer?

they reason that if it pays to go one or two inches deeper than was done with horses they will profit further by going still deeper. Many of us would call that subsoiling. If we followed such a plan regularly I fear that we should lose much of the value of cover crops and manures and other fertilizing material that was plowed under. The best corn crops are usually those that are forced in their early growth by ideal soil conditions and plenty of plant food, and if we put the plant food deep underground it will not be available to the corn until its root system reaches down there for it. The same is true of any other crop. The tiny organisms that cause the decomposition of the fertilizing elements might be placed so deep in some fine soils that their action would be slow, as their supply of air would be partially cut off. Air does not circulate very deep in our soils. I am not opposed to subsoiling under certain conditions, but I do believe that it ought to be accomplished by a gradual deepening of the plows each time the soil is turned rather than to do it in a single plowing season.

When we turn over a nice slice of soil that crumbles as it twists and settles compactly into place and leaves very little of a ridged surface behind, somehow we feel a certain pride in the results. But when we go onto this same soil with a disc harrow and leave a powdered seedbed behind that is deep and mellow, with no sods or stalks or anything to clutter up the surface, there is a feeling of genuine satisfaction that the plow has gone deep enough to put all the trash out of the way and where it may be utilized as plant food.

Shallow plowing has a number of drawbacks. It is harder, as every farmer who has tried it will testify, to make a good seedbed; and if you do get a good, fine seedbed it will more than likely be trashy. More effort is required to make a seedbed. A disc harrow, for instance, will pull easier where the soil has been plowed eight inches deep, than it will where the soil has been plowed five inches deep, and it is not so likely to turn up sods and trashy material.

It is only after doing a good job of plowing that we can do good work in the preparation of the seedbed. Much depends on the kind of plows used and whether they are suited to the character or condition of the soil. The condition of the soil has a great influence on the quality of the work being done. Plowing it too wet is bad practice and makes it harder still to make a mellow seedbed unless the soil happens to be full of humus. If we combine moderately deep plowing with favorable soil conditions we may obtain good results in the way of better seedbeds, and these are steps toward surer crops and improved yields; but there are other factors also that tend greatly to reduce or increase yields. Let's not be too quick to sink our plows beyond a reasonable depth.

What is Balance of Nutrients?

A. C. McCANDLISH, IOWA

THE expression "Balance of Nutrients", is frequently used in an unbalanced way. It means that not only should the requisite amounts of digestible nutrients be supplied but also that proper relations should exist between the various digestible nutrients present and between the digestible and indigestible portions of the ration.

It has been shown that to a considerable extent the main classes of nutrients—proteins, carbohydrates, and fats—can be used interchangeably in the animal organism; for example, proteins can be used for the building up of body fat and the functions of the fat of the ration can be almost completely taken over by the carbohydrates. In spite of this, however, no one nutrient, or group of nutrients, should be used to the exclusion of any other if the best results are desired.

Proteins are absolutely essential for the repair of body tissues and the formation of the nitrogenous constituents of the foetus and the milk, while the majority of the other duties performed by proteins can be taken over by the carbohydrates and fats. It does not pay, however, to feed just the minimum amount of protein required for these vital processes as additional protein appears to have a stimulating effect on general metabolism and consequently on milk production. On the other hand again, proteins are, as a rule, much more costly than are the other nutrients and so too much protein in the ration will render milk production uneconomical. It is evident, therefore, that a balance must be preserved between the nitrogenous and non-nitrogenous constituents of the ration and the exact balance to be used must be determined by the requirements of the individual animal and the relative costs of the various nutrients.

Similarly, carbohydrates and fats can be used interchangeably for certain purposes and yet a proper balance, from the nutritional and economic standpoint, should be maintained between those two classes of nutrients.

Feeding standards recognize only the main classes of organic nutrients, no attention being paid to the ash of the feed and yet it is one of the very important constituents. One of the main reasons for the neglect to mention ash requirements in feeding standards is that, in general, ordinary farm rations contain enough mineral matter to meet the requirements of the dairy cow; and then again very little work has been done to determine the actual ash requirements of farm animals. From what work has been done it may be said that the requirements of dairy cows for some of the more important ash constituents are perhaps somewhat as given in the next table:

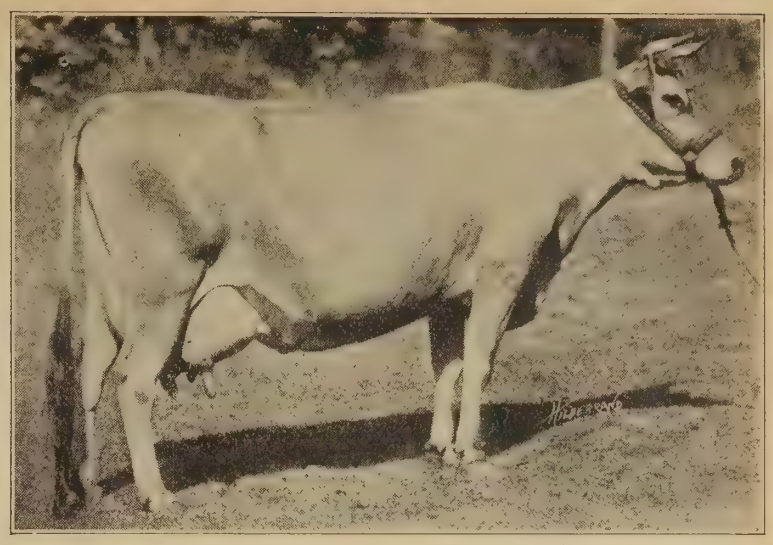
Ash Requirements of the Dairy Cow (From Armsby)

	Calcium gms.	Phosphorus gms.
For maintenance per 1,000 lbs. live weight	32	10
For production of 20 lbs. lbs. of milk	29	15

This demonstrates the small ash requirement of the dairy cow. Although small, it is very important and when sufficient ash for production is not present the cow will draw on her own body for the necessary constituents until her reserve supply becomes exhausted when she will decline in milk production as was shown at the Wisconsin Station where a cow used 25% of the lime in her body for milk producing purposes.

If a cow is being fed a ration that is deficient in one or more of the necessary nutrients she will draw on her own body for the supply of these nutrients necessary for milk production, and when this supply is exhausted she will decrease in production. Many cows are doing this. They produce milk in fair quantities for a few months after calving, not because their ration is composed of ear corn, timothy hay, and cornstalks, but in spite of it. However, after they have drawn upon their bodies as long as they can for the nutrients necessary for milk production they rapidly decline in their yield of milk. When they are dry again they store up in their bodies nutrients to be used for milk production during the next short lactation period.

A proper balance of the nutrients—protein, carbohydrates, and fat—should be maintained in the ration but just what that balance should be is rather difficult to state. However, it may be said that the best results will usually be obtained when the nutritive ratio of the ration—the ratio of the digestible crude protein to the digestible carbohydrate equivalent—is between 1:4½ and 1:6. The balance of nutrients required by a cow depends on a considerable number of factors, but only the more important ones can be considered here.



Age

Young cows are still growing while they are producing milk and their ration should provide the nutrients required for this growth, and thus a ration for milking heifers will require

(Continued on page 473)

EMINENT'S FOXY BELLE HAS A RECORD AS A THREE-YEAR-OLD OF 14,920 LBS. MILK, 816 LBS. FAT. SHE STANDS THIRD IN THIS CLASS IN AMERICA

PILOT'S ROCKLAND BEAUTY HAS A RECORD OF 13,303.1 LBS. MILK, 767.39 LBS. FAT

WAIKIKI JERSEYS

TO appreciate fully the character of Jersey cattle kept on Waikiki Farm, Washington, requires a personal visit. We have never seen a better herd of developed and high producing Jerseys. There is something appealing in the general conformation and the dairy talent of the cattle in this herd. They are large, strong, and robust individuals, indicating by their type that they have unusual dairy capacities, and they are proving it by the records they are making. A cow that will not produce at least 700 lbs. of fat in a year is not considered up to Waikiki standards.

Waikiki Farm is owned by Mr. J. P. Graves. He has owned the land in this farm for many years but only recently has he given close attention to its development. For many years Mr. Graves was engaged in building railroads and later became interested in the largest copper mine in the British Empire. His large business activities kept him away from farm life which is so attractive and so wholesome to him, but for the past eight years he has made his home on his 1,000-acre farm.

Two hundred and fifty acres of this farm are nestled in a valley and, rising on several sides, are the mountains. These 250 acres are devoted entirely to pasture which is well supplied with springs and flowing wells, hence the name "Waikiki", meaning "lots of water" in the language of the Hawaiian. About 160 acres of the upland are devoted to the growing of crops. Chief among them are sunflowers for silage and rye for early pasture. The rye pasture comes on so that in February it is large enough to graze and furnishes splendid feed until the pasture in the valley is ready to receive the cattle.

Mr. Graves' early experience was with Shorthorns but he found that they were not adapted to his style of farming. He then chose Ayrshires. At about the time he had established a good herd, a dog, suffering from hydrophobia, bit 38 head and caused their death. He disposed of the rest and then chose Jerseys. For the past fifteen years he has been breeding Jersey cattle and has attempted to develop a herd of unusual production, bearing in mind the necessity of keeping the animals as uniform in type as possible. He desires strength in his cows, not only for the production of milk but for reproduction. The production of strong, vigorous young animals is as important a part in the breeder's operation as is the production of high capacity cows, for the calves ultimately become cows.

EMINENT PILOT, SIRE OF 18 R. OF M. AND 3 GOLD MEDAL DAUGHTERS

Waikiki Farm owns 250 pure-bred Jersey cows and is the largest Jersey establishment in the Northwest. Forty-five of these cows are on Register of Merit test. The total number of cows milking on the farm is 125.

Mr. Graves recently purchased a few Holsteins and expects to develop the same character of Holsteins as he has Jerseys. He will soon construct a barn which will hold 60 milking Holstein cows. There is reason to believe that he will be as successful in the development of the Holstein cow as he has been with the Jersey.

The bull, Eminent Pilot, has contributed more to the breeding of this herd than any other sire. On the maternal side of his pedigree is found the blood of the St. Lamberts, the Stoke Pogis, and the Rioters. His sire is Eminent Imported, rich in the Golden Lad blood. Eminent Pilot is the tenth Gold Medal bull of the Jersey breed. The accompanying illustrations of four of his daughters show the character of cows he has sired.

It will be noticed that Pilot's Model of Waikiki is an unusually well typed animal. There are a number of such cows in the herd by Eminent Pilot. Eminent's Nelly Sultan shows a cow of strong dairy development but not quite the type which the breeder might seek. She is not the kind to be discarded, because she possesses wonderful dairy qualities. The cow, Eminent's Foxy Belle, with a record as a three-year-old of 14,920 lbs. of milk and 816 lbs. of fat, is another of Eminent's daughters which shows the character of cows on Waikiki Farm.

The present herd bull is Sultan of Rockland, a R. of M. son of Eminent Pilot and out of Sultan Nelly of St. Martins with a record of 16,217.7 lbs. milk and 755.86 lbs. fat. It is the idea of Mr. Graves to develop the blood of Eminent Pilot for he appreciates it would be difficult to improve upon the dairy talent of this bull's daughters.

Mr. Graves has exhibited his Jerseys at the various fairs and expositions on the Pacific Coast and has won many blue and champion ribbons. The cattle taken to the fairs have not been his highest producing animals. He has found that it is not the easiest thing to get the type which will win prizes in the show ring to produce the highest records. At times he has felt like purchasing a show herd for exhibition purposes at fairs and expositions and to advertise his cattle. This does not appeal to us as being the logical course to pursue. We believe he has many cows in his herd that the show ring ought to recognize, and Pilot's Model of Waikiki is one of them.

It is the breeder's duty to not only create high producing cows but to have them beautiful in form, and it is the duty of the show ring to recognize not only the type which is beautiful but that which also shows production. We recognize it is held by many that the show ring simply has to do with type and not production. We will not discuss this point here, but we do think that a herd of Jerseys so well developed and capable of as large production as those on Waikiki Farm, and many of splendid conformation, should have an opportunity to be recognized in the show ring and that the owner should not be led to consider the purchase of a herd simply for exhibition purposes.

EMINENT'S NELLY SULTAN HAS PRODUCED 16,217 LBS. MILK, 756.08 LBS. FAT IN ONE YEAR

PILOT'S MODEL OF WAIKIKI, GOLD MEDAL JERSEY COW, WITH A RECORD OF 16,076 LBS. MILK, 746.8 LBS. FAT. SHE WAS GRAND CHAMPION AT THE 1918 SPOKANE INTERSTATE FAIR

ELECTRICITY FOR FARM LIGHTING

A. G. TYLER, Minnesota College of Agriculture

ALL things considered, electricity is probably the most satisfactory medium for lighting farm buildings. It is not as cheap as some other forms nor is it so easily installed, especially in an old house, but once in service it has advantages possessed by no other system. Electricity may be bought from a lighting or power company if there happens to be one conveniently near or it may be generated by means of an engine and dynamo and used in connection with storage batteries. When it is taken from a power line a transformer is generally necessary in order to reduce the voltage down to where it is safe for the ordinary person to handle. The first cost of this transformer is quite high and is generally borne by the consumer but there is practically no maintenance expense. Rates for light and power vary to such an extent that it is difficult to say which is the cheaper, to buy or to make. Ordinarily, however, when a company or person goes to the expense of making a product and delivering it to you, you expect to pay them for their trouble. If you make the thing yourself and deliver it yourself it is only reasonable to think that it will be cheaper in dollars and cents, but the time expended may make it a very costly article. The aim of all concerns who make rural electric lighting outfits has been and is to make them just as simple as possible so that a minimum of time and special knowledge will be required. This is shown by the fact that most of the plants will practically run themselves; indeed, one or two will actually start and stop themselves.

The usual method employed in these small systems is to generate electricity by means of an engine and dynamo and to "store" this energy in "storage batteries". The term storage battery is a misnomer since the electricity is not actually stored as you would store wheat in a granary or put water into a jug. It does, however, produce or induce a certain chemical action which is somewhat analogous to the freezing and thawing of water.

Amperes and Volts

Before making any attempt to explain the action that takes place, it may be well to define the units that are used in connection with electricity as it is ordinarily used on the farm.

Whenever a thing or substance of any kind is handled or measured some sort of unit or units are necessary; for instance, bushels, pounds, feet, etc., the corresponding electrical unit being the coulomb. Whenever work is done time must be considered, thus bushels per day, pounds per hour, feet per minute, etc., the electrical unit indicating time and quantity is the ampere. In other words, ampere means rate of flow of electrical energy. The amount of work done or the distance an object is moved is always directly proportional to the speed or pressure exerted. The electrical unit of pressure is the volt. There is always a certain amount of friction to be overcome when an object of any kind is moved. The electrical unit of friction or resistance is the ohm. Briefly, an ampere is the amount of current which will flow in one second through a conductor having a resistance of one ohm when the pressure is one volt.

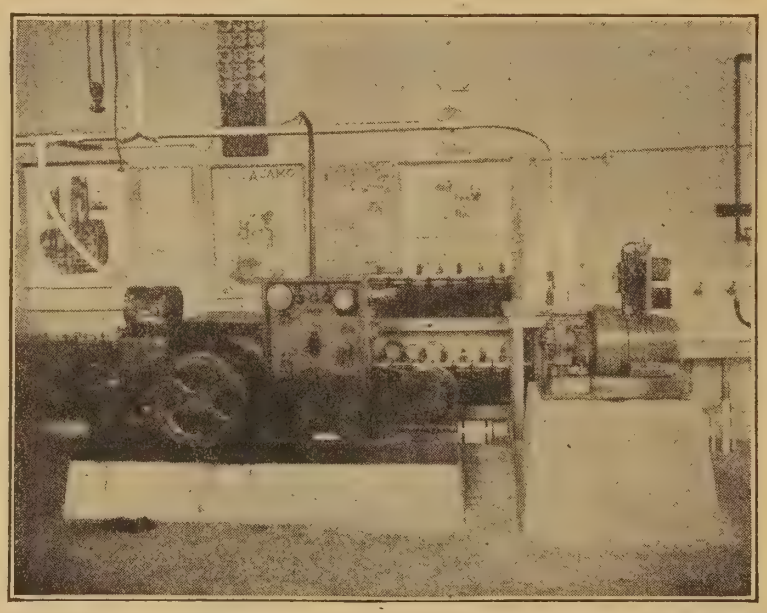
To return to storage batteries, if two different substances such as copper and zinc are placed in a weak solution of acid and water and these substances are connected by a wire outside of the solution, an electric current will flow through this wire. The strength of this current will depend upon the substances chosen for the electrodes, the kind and strength of the acid solution, and the resistance. The action that takes place in the cell is too complicated to be spoken of in detail in this article but, roughly, one electrode goes into solution and is carried across and deposited upon the other electrode. The strength or speed with which these particles go from one electrode to the other is the voltage or pressure produced by the cell, while the number or quantity going from one electrode to the other indicates the amperage. If a cell will give up electricity only it is known as a primary cell, if it will both take in and give out electricity, it is known as a secondary cell. A storage battery is a number of secondary cells connected together in a certain way.

There are a number of types of secondary cells which are used in storage batteries but only two of the more important ones will be spoken of. Until recently the large majority of storage batteries were of the lead-acid type and this type probably still predominates but another kind known as the nickle-iron battery is becoming quite popular.

The lead cell consists of positive and negative electrodes immersed in a solution of dilute sulphuric acid. The positive electrodes or plates are lead peroxide while the negative plates are pure sponge lead. The terms positive and negative simply indicate from which and to which the particles are traveling. The action is always from negative to positive when the current is going out and from positive to negative when the current is going in. When current is being taken from a cell of this kind the lead peroxide goes into solution as lead sulphate, part of which is deposited on the other plate as pure lead. If the electrolyte is too strong, that is, contains too much acid, the plates will be eaten up. The positive plate is attacked as well as the negative but the action is not so rapid.

When a cell is first put in use the acid in the electrolyte tends to and does go into the plates leaving the solution weak, that is, nearer pure water. When the cell is charged some of the lead is changed to lead sulphate, the lead is carried across and plated on the other electrode leaving the acid in the solution. Since acid is heavier than water the specific gravity of the electrolyte will become greater. By testing this electrolyte with an hydrometer from time to time the condition of the charge may be noted. If the specific gravity is low, the cell needs charging; if it reads a certain amount, generally 1.300, the cell is fully charged. If the cell or battery is kept fully charged, it will not freeze, due to the large amount of acid in the solution.

With lead cells the only attention needed, aside from keeping them charged, is to add water from time to time. This water must be pure if the cell is to give good satisfaction. Distilled water or rain water caught out in the open in an earthen dish is the best. Well water practically always contains the salts of some minerals which would be harmful to a cell. The more a battery is used the more the cells will need filling. The water not only evaporates but is also changed to gas by the electricity. Notice the bubbles that rise to the top when a cell is being charged; this is the action known as electrolysis of water. If the electrolyte is allowed to get low in the cell it becomes stronger, that is, there is more acid in proportion to the amount of water than there should be. The result is that the plates tend to be eaten away by the strong acid and the wooden separators are apt to be destroyed.



Storage cells are made in many different sizes but the majority deliver their current at a pressure of about two volts, a little more when fully charged and a little less when nearly empty.

The action which goes on in the nickle-iron cell is quite similar although the electrodes and electrolyte are entirely different. The positive plate is nickle oxide and the negative pure iron. The electrolyte is a solution of caustic potash, a strong alkali instead of an acid.

The voltage of the ordinary nickle-iron cell is somewhat lower than that of the lead cell being about 1.2 volts, consequently to deliver current at a certain voltage, more nickle-iron cells will be required than of the lead type.

The makers of the nickle-iron cell claim that it will stand more abuse, that it is lighter in weight, that it will stand charged or discharged for any length of time without injury, and that it will last longer than the lead cell. The lead cell makers say that their cells deliver higher volt-

Overton Gives Michigan Dairymen Some Plain Facts

THE address of Glen Overton before the National Allied Dairy Association at Grand Rapids, Michigan, recently was full of valuable information. He stated that practically every farm in Michigan is a producer of milk or cream and that the direct returns from the sale of these products is usually the farmers' only certain and regular income. The total sale value of this product is approximately $200,000,000 per year, which is practically the equal of the total value of all other farm products.

"To handle this raw material," he says, "there are in Michigan 248 creameries, 65 cheese factories, 21 condenseries, 258 ice cream plants, 19 milk skimming stations, 1,016 cream buying stations, 939 milk distributing plants, 98 milk depots, 104 milk stores, and 1,742 milk wagons. One-half of Michigan's milk is consumed as fluid milk, a little over one-third is manufactured into butter, while the remaining one-sixth goes into cheese, condensed milk, and ice cream in about equal proportions."

The following are excerpts from this address:

"If every man, woman, and child in this country could be persuaded to use one quart of milk daily, living costs would be less, general health better, and there would not be half enough milk to go around.

"Would you believe that there are manufacturers of butter in this state who are afraid that an increased demand for milk in our towns and cities would cause a falling off in their business, and that there are distributors of bottled milk who are rather inclined to knock the condensed milk business for fear it will interfere with them; and that there are ice cream manufacturers who rather hesitate to contribute towards a fund to advertise the food value of milk for fear the demand would increase and make the sweet cream that they need in their business cost them more? And that there are producers of milk who insist that the consumer be charged more for a quart of milk than, with his present limited understanding of its food value, he is willing to pay?

"Plenty of these same producers have no larger conception of the principle underlying the stability of their own business than to think that they are showing good business judgment when they want enough for one pound of butterfat so they can purchase two pounds of oleomargarine.

"Do you realize that it is an established fact that the country child drinks less milk than the city child?

"Did you know that the consumption of butter substitutes is greater in the rural sections than in the centers of population?

"There is no question but that if every producer of milk who is now confessedly producing milk at a loss would give his family all the milk and butter they should have, the market value of these two most necessary human foods would almost double in less than 30 days.

"When we realize that there are dairy cows that produce better than thirty thousand pounds of milk per year, isn't it about time that we start seriously to replace the four to six thousand pound variety?

"There is no profit in the dairy business, never will be, and never should be for the fellow who uses a scrub sire and hasn't time to keep a milk and feed account with each of his cows. These same methods would not succeed in any other business and they won't in the dairy business.

"It takes an intelligent, industrious person who really likes his work to develop and properly care for a dairy herd, and I don't believe the time will ever come in the dairy business when such a person will not make good profits producing milk.

"Now no sane dairyman or anyone interested in the dairy business in its various phases has any quarrel with white oleomargarine sold as such; our fight is with the dairymen who buy this butter substitute and thereby cheapen the value of their own and their neighbors' product; and with the oleo manufacturer who hires 'buttermakers', builds 'creameries', and makes 'freshly churned' oleomargarine, and until we make a first class product ourselves—and then before asking the other fellow to buy it, we use it ourselves—we can blame no one but ourselves if milk and butter prices are not satisfactory.

"The poor quality of cream produced under the present system has brought about a gradual decrease in the quality of Michigan butter, so that the annual loss from poor butter alone is an enormous amount.

"Don't you know that every pound of poor inferior cream that is made into poor butter is a boost for oleomargarine?"

Farm Manure Aids State Greatly

A. W. HOPKINS, Wisconsin College of Agriculture

TIME was when the Middle West grew wheat. Wheat, wheat, and more wheat was grown in the vain hope that such bumper crops as the old timers told about would be produced. Meanwhile the soil grew poorer. A few far-sighted men saw that dairying and live stock production must be encouraged. So while others pulled up stakes, these few men told their neighbors to stick to it—dairying and live stock would save the state. And it did.

Barnyard manure has made the dairy state. Prior to 1870 the crop yields of Wisconsin steadily declined. Since that time the yields per acre have continually increased. Farm manure is the state's chief fertilizer, and farmers here, as elsewhere, are finding it decidedly to their advantage to save it as much as possible.

Leached, fired, poorly kept farm manure represents a tremendous loss to the fertility and to the wealth of any state. Well handled barnyard manure means money in the farmer's pocket.

SAVE FARM FERTILITY

FARM MANURE IS WISCONSIN'S MAIN FERTILIZER

While the farmers of some of the older states spend, each year, millions of dollars (often 6 to 7 per cent of the total value of farm products they raise) in the purchase of commercial fertilizers, the farmers of Wisconsin use them only for special crops such as tobacco and potatoes or to supply certain soils with any deficient element.

IS TOO VALUABLE TO LOSE

Commercial fertilizers are rapidly advancing in price. This makes farm manure even more valuable and the need of saving it still more urgent.

Even in Wisconsin where many depend on live stock and clover, or other legumes, to keep up fertility, the value of farm manure is often not fully appreciated. Do you realize that about 80 per cent of the fertility in feed consumed by animals is not stored in their bodies, but becomes manure, which should be returned to the soil to produce new crops?

HOW FERTILITY IS LOST

AGRICULTURAL EXPERIMENT STATION, THE UNIVERSITY OF WISCONSIN, MADISON

Specially designed for warming, by hot water, small farm or town homes, one- or two-story, with or without cellars

Have the Comfort You've Always Wanted

Gives delightful comfort in all rooms for howling winter weather or the dangerous, damp days of changeable spring. Windy weather makes no difference—the heat goes to every room. Most reliable heat there is. Outfit lasts longer than the building. Absolutely safe—no fire risk.

Keeps Them on the Farm

The ARCOLA Heating Outfit warms the home all over for the family and help. It makes farm life just the best life there is. It keeps the young folks on the farm, because it makes home so cozy and cheerful.

Most Heat at Least Cost

Why not find out at once about this small, hot water heating plant for your home? It will give you the greatest comfort at the lowest cost, and relieve you of monotonous drudgery of fussing with stoves, grates, and old-fashioned heating devices.

New Low Prices Now in Effect

The ARCOLA is made for small houses, with or without cellars. Running water not necessary. ARCOLA is placed in any room with a chimney. It heats that room and circulates hot water through small pipes to radiators in the other rooms. Pipes may be run through walls or left exposed, thus helping to warm the rooms. Heats all rooms with one fire. Burns coal or wood—uses less fuel to heat whole house than a stove requires for a few rooms.

Why not Have It NOW?

Find out about the ARCOLA to-day from your local heating dealer. Write for illustrated catalog showing open views of Ideal-ARCOLA Heating Outfits in 4-, 5-, 6- or 7-room houses—also just the thing for chicken and hog houses and garages.

AMERICAN RADIATOR COMPANY

Department F 20 816-822 S. Michigan Ave., Chicago, Ill.
Sales Branches and Showrooms in All Large Cities
Makers of the world-famous IDEAL Boilers and AMERICAN Radiators

Save That Extra Wool

Hand blade shearing is wasteful at best. Even the most expert hand shearer leaves uneven cuts and ridges.

Might as well throw away the wool from every seventh sheep as to shear with hand blades. A Stewart Machine shears evenly over the entire body. It gets ALL the wool—with long, even fiber—in best condition for top market prices.

Quickly pays for itself—light, easy running—indispensable to every sheep owner.

The Stewart No. 9, hand operated, is the machine for small or medium flocks. Ball bearing—sturdily built—lasts a lifetime. Only $22 at your dealer's, or send us $2 and pay balance on arrival.

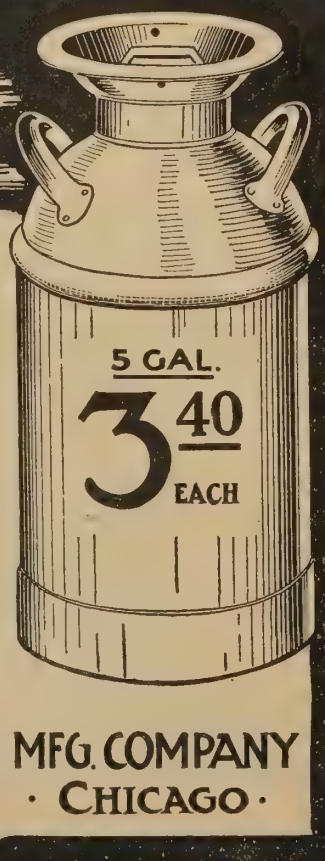
Write for Catalog No. 69 if interested in power operated machines.

CHICAGO FLEXIBLE SHAFT COMPANY
Dept. B 156, 5600 Roosevelt Road, Chicago

"Dandelion Butter Color" Is Big Prize Winner

Be sure and use Dandelion Brand Butter Color and give your butter that June golden shade which brings **top prices** —pleasing the eye and tempting the palate.

The High Scores of 1920



In many of the State Buttermakers' Shows, first awards were won by users of old reliable "Dandelion Brand." You can't miss by giving a trial to the butter color which helps 90% of the successful buttermakers of America.

Never gets rancid. Doesn't affect flavor.
Doesn't color the buttermilk. Leaves no sediment.
Colors more butter to the gallon.

Dandelion Brand Butter Color is purely vegetable and fully meets requirements of all **Food laws**—State and National. Ask your jobber for prices.

WELLS & RICHARDSON CO., Inc. **BURLINGTON, VERMONT**

BUILT FOR DURABILITY

CP Xtra-strong Milk and Cream Cans

are famous the country over for long life and accurate measure. They are heavily tinned from pure block tin after stamping. All joints are loaded with solder and the interior is absolutely smooth. There are no bacteria harbors. Neck and breast are joined on a powerful press in a perfect grip-lock joint, watertight before tinning.

The Climax can shown herewith is a splendid can for wagon use, for delivering milk and cream to the creamery, etc.

Association Notes

Petaluma, California:—During the season every scrub or grade bull but one has been replaced by a pure-bred.

Bodega, California:—This unit is working hard on a campaign to increase the number of silos in its district.

Clatsop County, Oregon:—A number of carloads of grain and hay have been bought through the Oregon Dairymen's League to the advantage of the dairymen. Prices are: ground oats, $44 per ton; millrun, $37; ground barley, $45; alfalfa hay, $22—$27. Market milk testing 3.8% sold for $3.90 per cwt. in February.

Dupage, Illinois: — One member has disposed of his remaining grades at auction giving the association a total of seven pure-bred Holstein herds. There are now 25 members in this association. During February several unprofitable cows were sold to the butcher. Milk testing 3.5% sold for $2.35 per cwt. and 4c per point above. Milk retails for 14c per quart, butter for 60c per pound. Feed prices are: hay, $25 per ton; silage, $6; corn, $24; oats, $25; barley, $30; bran, $34; cottonseed meal, $40; oil meal, $38; gluten, $50.

West Branch-Tri-County, Iowa:—At present all members are using pure-bred bulls and breeding for entire pure-bred herds. Most of the members are trying to increase production through better feeding. No co-operative buying has been done for some time. February milk sold for $3.15 per cwt., a test of 3.5% being required and 9c paid per point above. The creamery paid 47—50c per lb. for fat. Milk retails for 15c per quart and butter for 50c per lb. Feed prices are: corn, $12 per ton; oats, $20; bran, $35; oil meal, $55; cottonseed meal, $40; silage, $6; alfalfa hay, $18; mixed hay, $12.

East Troy, Wisconsin:—When one of the members recently ceased feeding soy bean silage, the average test of his herd dropped four points, although the other feed was not changed and the same number of cows were milked. The average return for each dollar expended for feed in the association in February was $1.47. The average feed cost for 100 lbs. of milk was $1.50 and for one pound of butterfat 41c. Twelve cows were sold during February as unprofitable and 16 for dairy purposes. February market milk testing 3.5% sold for $2.35 and 4c per point over. Milk retails for 12c per quart, butter for 53c per lb., and cheese for 40c per lb. Feed prices are: bran, $25 per ton; middlings, $24; oil meal, $45; cottonseed meal, $44; brewers grains, $35; Unicorn, $52; gluten feed, $42; hay, $18—$20; silage, $6.

Monticello, Wisconsin:—One pure-bred Holstein bull was purchased and one car of bran bought in February. Market milk testing 3.5% and 3.7% sold for $2.00 and $2.10. Milk retails for 10c per quart. Bran sells for $28 per ton; oil meal, $48—$52; cottonseed meal, $42—$46; hominy, $28; oats, 48c per bushel; silage, $6; per ton; alfalfa, $30.

Porter County, Indiana:—Eight cows are on official test. Seven cows were sold during February as unprofitable. Most members are feeding corn, oats, and cottonseed meal, but some are feeding a larger mixture including gluten feed, bran, and oil meal. February market milk testing 3.5% sold for $2.35 per cwt. The creamery paid 40c per lb. for fat. Milk retails for 14c per quart and butter for 60c per lb. Feed prices are: corn and cob meal, $18 per ton; corn meal, $22; cottonseed meal, $40; oil meal, $50; gluten feed, $48; hominy feed, $36; bran, $32; ground oats, $25; alfalfa, $20; clover, $18.

Oldham County, Kentucky:—This association now has sixteen registered dairy sires heading its herds, two unregistered pure-bred, and only two grades. Two dairymen have individual drinking cups and are satisfied they are a very profitable investment. Two men have milking machines and report quite satisfactory results. All dairymen have from one to three silos except those just starting in the dairy business. Four per cent milk sold for 22c per gallon in February. The creamery paid 47c per lb. for fat. Milk retails for 11c per quart and butter for 48—50c per lb. Feeds sell as follows: cottonseed meal, $36 per ton; ground oats, $4[illegible] bran, $36; oil meal, $58; corn, 60—70c per bushel; rice bran, 28—30c.

Lycoming, Pennsylvania:—There are 26 members in this association practically all of whom have pure-bred bulls. Fourteen have either tested or made application for having their herds tuberculin tested. Fifteen of them are solicitors in the Farm Bureau Membership Campaign which is now being carried on.

Calkins, Pennsylvania:—Several members are feeding balanced rations. During February two boarder cows were slaughtered and eight oth

ers sold. Three per cent market milk sold for $2.65 per cwt. and 4c per point above. Feed prices are: cottonseed meal, $45 per ton; gluten, $47; oil meal, $50; bran, $34; corn meal, $36; ground oats, $40.

Columbia County, Oregon:—Five cows were sold during February and two unprofitable cows disposed of. Increased production is better than in the past five months. All members are now feeding grain with such results that it has proven that it pays to feed grain. The cheese factory paid 58—62c per lb. for fat. Milk retails for 40c per gallon. Feeds sold as follows: corn meal, $2.40 per cwt.; oil meal, $4.25; mill feeds, $2; oats, $40 per ton; cocoanut meal, $37; mill run, $34; alfalfa, $26; clover and timothy baled, $27; oats and vetch baled, $32.

Richfield, Wisconsin:—One new member has stopped feeding five times per day and is feeding a balanced ration with the result that he has less work to do in caring for his cows and an increase in milk flow the first month sufficient to pay for his year's testing. Three per cent market milk sold for $1.80 per cwt. The condensery paid $2.25 per cwt. for 4% milk and 5c per point above. The creamery paid 64½c per lb. for fat and the cheese factory paid 56c per lb. Milk retails for 11c per quart, butter for 55c per lb., and cheese for 30c per lb. Feed prices are: oats, 33c per bushel; barley, 70c; corn, $1 per cwt.; bran, $27 per ton; gluten, $45; oil meal, $50; wheat middlings, $22; hominy, $22; brewers grains, $8; wet beet pulp, $1.50 per ton.

Lyon County, Kansas:—The only grade bull in the association has just been replaced by a pure-bred. Better and heavier grain feeding has raised the association average from 20 lbs. butterfat per cow a year ago to a 30-lb. average for February, this year. More cows are above 40 lbs. now than were above 30 lbs. a year ago. Market milk sells for $3 per cwt. The creamery paid 40c per lb. for fat. Milk retails for 15c per quart and butter for 40c per lb. Feed prices are: corn chop, $1.20 per cwt.; oil meal, $3; bran, $1.25; cottonseed meal, $37; alfalfa, $10; silage, $4. A Holstein heifer owned by P. P. Macy has just broken the state seven-day milk record in the junior two-year-old class. This heifer produced a total of 522.1 lbs. of milk containing 16.96 lbs. of fat. The former record was 508.5 lbs. of milk.

Bourbon County, Kansas:—In the 25 herds tested, only three are not headed by pure-bred sires, and these three herds use pure-bred sires for some of their cows. Most of the dairymen are grinding and mixing their own feeds. The creamery paid an average of 43c per lb. for fat during February. The condensery paid $2.25 per cwt. for 4% milk and 5c per point above. Kansas City distributors paid 23c per gallon for 4% milk. The local dairy paid $2.75 per cwt. for 4% milk and 6c per point above. Butter sold for 55c per lb. and cheese for 40c per lb. Milk retails for 12c per quart. Feed prices are: bran, $28 per ton; corn and cob meal, $17; ground oats, $25; cottonseed meal, $32; oil meal, $50; alfalfa, $15; silage, $6.

Coshocton County, Ohio:—Several herds have been tuberculin tested. Four per cent market milk in March sold for $2.53 per cwt. The creamery paid 51c per lb. for fat. Milk retails for 17c per quart and butter for 50c per lb. Feed prices are: corn, 72c per bushel; oats, 48c; bran, $36 per ton; cottonseed meal, $53; silage, $8; hay, $15.

Cheshire County, New Hampshire:—One out of every eight cows produced over 1,000 lbs. milk or 40 lbs. fat in February. Five farmers have begun feeding balanced rations and very favorable gains are being made. Since December six unprofitable cows have been disposed of and the association is "100 per cent" free from scrub or grade bulls. One member has purchased a new pure-bred bull and another has traded his for a better individual. The high cow for February also proved to be the most economical butterfat producer for the month.

Merrimac Valley & Strafford-Carroll, New Hampshire:—During February five unprofitable cows were sold. Market milk testing 3.7% sold for $3.95 per cwt. The creamery paid 52c per lb. for fat. Milk retails for 15—16c per quart. Feed prices are: bran, $38 per ton; gluten, $58; cottonseed meal, $48; oil meal, $54; ground oats, $44; corn meal, $57; middlings, $36; hay, $23; silage, $10.

Claremont & Lebanon, New Hampshire:—Farmers in the region around Bellows Falls are organizing a cooperative creamery in order to get a better market. The plan is to charge $25 per cow, 10% of the money to be paid in cash at once and the remainder to come from the milk checks. February market milk here sold for $3.50 per cwt., a test of 3.7% being required. Milk retails for 10—12c per quart and butter for 60c per lb. Feed prices are: bran, $39—$50 per ton; gluten, $50—$60; cottonseed meal, $48—$58; linseed meal, $46—$50; ground oats, $35—$45; corn meal, $36—$44; corn and cob meal, $30; silage, $8—$9; mixed hay, $20; beet pulp, $54—$60; beets, $6.

The prize of life, the crowning fortune of a man, is to be born to some pursuit which finds him in employment and happiness whether it be to make baskets or broadswords or canals or statutes or songs.—EMERSON.

You can raise the finest kind of good growthy calves—and save money, too—by using

Blatchford's CALF MEAL

EVERY time you raise a calf on milk instead of on Blatchford's Calf Meal it costs you unnecessary dollars. By using this carefully prepared, high quality product you can positively reduce the cost of raising your calves—not a dollar or two only—but *many* dollars.

Blatchford's Calf Meal has been used by American farmers for upwards of 40 years. It has earned for itself an enduring reputation as a genuine and reliable milk-substitute which can be depended upon to grow calves rapidly and develop them properly.

One *pound* of Blatchford's Calf Meal makes *one gallon* of pure milk-substitute. At present market prices every gallon of milk you replace with a pound of Blatchford's nets you an actual saving of approximately twenty cents. It takes about 200 gallons of milk to raise a calf properly to six months. If you were to replace this quantity of milk with 200 pounds of Blatchford's Calf Meal it would save you $40.00 on the calf—a real, worth-while saving. Don't raise another calf on milk until you have at least given Blatchford's a *trial.*

There are many brands of calf meals on the market—but only one *Blatchford's.* Insist upon getting it. Order today—from *your dealer.*

Co-operative Milk Distribution in Kentucky

HOARD'S DAIRYMAN:—For years the milk producers contiguous to Louisville, Ky., have been in a fight with the large distributors in regard to scale of prices for their products. Farmers are proverbially hard to please, but these dairy farmers have felt their grievance sore when it was known that the city people were equally dissatisfied at the prices they were paying, namely 100 to 125 per cent above the figures their cousins in the country were receiving.

During the war the distributors were held down to a 100 per cent spread, but when hostilities ceased and the government restrictions were withdrawn, up went prices to the consumers and down fell those to the producers. Things became very much out of joint. The city people swallowed their indignation with their high priced milk, and the country folks met, discussed, cussed, and resolved, but kept on shipping their milk because the cows would not go dry all at once. Many good dairy herds were dispersed and the owners quit the business, but fairly high prices for butterfat reigned and other herds were established.

It is said that necessity is the mother of invention. After the failure of a number of dairy unions, a few long-headed men who had some vision and grit got together and formed a co-operative body for the handling of their product in the city. A producers' association to deal with the established distributors of Louisville was urged and many such successful organizations in other states were cited, but these determined men had their goal set higher. Consequently the Kentucky and Indiana Products Company was organized—for Louisville gets much of its milk from across the Ohio river—the name later being changed to the Kentucky and Indiana Dairies Company, and the company incorporated.

J. W. Yager, a banker in a small town a few miles from Louisville, has been the active head of the organization since its inception about nine months ago. He canvassed the various dairy farmers, getting them pledged as stockholders. Some became cold-footed and wished they hadn't pledged their subscriptions, others pinned their faith to Yager.

A board of directors was formed last fall, and they got busy. T. E. Yann was one of the small but successful distributors, one who had worked a simple method of pasteurizing his milk and a successful way of distribution. He was approached and agreed to sell out to the association, he to manage the new business.

On January 5th, the new organization began receiving milk from 40 patrons. At this writing 300 dairy farmers are shipping milk to their own distributing plant to the amount of 4,000 gallons daily. About 600 gallons of sweet cream are coming in also. The company has not a single retail customer; every bottle goes through the groceries. Each patron or shipper is a stockholder and the company will not purchase from other than one of their members, and a hundred or more are on the waiting list, several being added daily, for the business is rapidly growing.

When asked why he preferred the groceries for customers, Mr. Yann replied: "The grocers are boosters, they like it for it pays them and we get our cash returns regularly. We have no trouble in collections or deliveries. This was my plan of distribution on a small scale before the company bought me out and it works well in our large distribution and is growing splendidly. I believe it is the logical method for the future."

The company employs two salesmen who visit the grocers, working up new trade and seeing that all goes well. When the business started four wagons did all the work. Within six weeks nine wagons and two half-ton trucks were busy all day delivering the cases of bottled milk to the grocers, and more wagons will be put on as soon as they can be secured. When the business started one driver came back the first day utterly disgusted; today that driver has all he can deliver. The salesmen have been instructed not to take "no" for an answer, and few groceries on the established routes of the wagons are not regular customers.

In reply to my inquiry concerning results, Mr. Yann said: "Our shippers are getting 22 cents per gallon, the same for their milk that they did when the city people were paying 16 cents per quart; today the people are paying 11 cents per quart, 7 cents per pint. We are delivering 4.7 per cent milk."

"Today we are giving our surplus skim to several institutions free and they send for it," continued Mr. Yann. "We are enlarging our build

PARK'S JUDITH BEAUTY

Park's Judith Beauty has broken the world's record for two-and-one-half-year-old Guernseys that have carried calves at least 265 days of their testing period by producing 12,107.0 pounds milk, 646.15 pounds butterfat. She is owned by John H. Williams, Wisconsin. The new champion was dropped in January, 1917, and dropped her first calf in September, 1919. Her second calf, which was carried 265 days of her testing period, was also a heifer and was dropped on November 18, 1920. She is a daughter of Governor of Bailey Falls, a grandson of Governor of the Chene. Her dam is Park's Queen Judith, that has a record of 454.43 pounds of butterfat in class G. Park's Judith Beauty and her dam, as well as the grandam and great grandam, were all bred by Mr. Williams.—AMERICAN GUERNSEY CATTLE CLUB.

Enlarged view of Porcelain Lined—Easy to Clean—Bowl Chamber, open. Shows Self-Balancing Bowl hanging free from single bearing.

Self-Balancing Bowl

The Secret of Perfect Skimming

The Belgium Melotte is the only single-bearing-bowl ever made. This patented bowl hangs from one frictionless ball bearing and spins like a top. It is self-balancing. It skims as perfectly after 15 years' use as when new. Positively cannot ever get out of balance and vibrate, thus causing cross currents which waste cream by remixing with the milk. Six hundred pound Melotte turns as easily as 300 pound Separator of otner makes. Spins for 25 minutes unless brake is applied. No other Separator has or needs a brake.

Belgium Melotte

Imported—Duty FREE

Invented by Jules Melotte — the Edison of Europe, stands first in Europe where every penny must be saved. Used on 90% of the Belgium dairy farms. Holds 268 international prizes. Admitted duty free by special act of Congress to save money for American farmers. The world's greatest Separator at a bargain price.

No Money Down

We don't want anyone to send us any money on the Melotte. We want to prove to you first that it is the best separator made. There are no papers to sign—no deposits or promises—no formalities. You are under no obligations. We take this liberal offer because we know a test of the Melotte will convince you.

$7.50 After 30 Days Free Trial

To convince you that the Belgium Imported Melotte is the best cream separator possible to buy anywhere in the world we will send one direct to your farm on a 30 day, absolutely unconditional free trial. Use it as if it were your own. Compare it with others—put it to every test. You alone are the judge. When the Melotte has sold itself on merit alone, send your $7.50 as first payment and make small monthly payments of $7.50 until the Separator is paid for.

Send for Free Book!

Don't buy any Separator until you have found out all about the Melotte, its 15 year guarantee and our 30 day free trial offer. Get our free book containing full description of this wonderful cream separator and the story of Jules Melotte, the inventor. Don't hesitate—don't do another thing until you write us.

Kill Rats

By Science—New Way

USE **Reefer's Rat Virus**—new discovery of French scientist. Used all over the world on ships, wharves, warehouses, etc. wherever rats are thickest.

Not a Poison

Sure death to every rat and mouse but absolutely harmless to children, dogs, cats, poultry, etc. Use freely without fear. It's a bacteriological concentrate—not a poison. Will kill only rats and mice. ***Makes them die outside.*** No rotting odors. Only perfect rat killer. Approved by highest scientific authorities.

Guaranteed to Kill Every Rat or Money Refunded

Use **Reefer's Rat Virus** and every rat and mouse on your premises will be gone, or your money refunded. Don't tolerate rats any longer. Send us $1.00 and we will send you enough Virus to clear your barn or house of rats. Results guaranteed. Send your order today. Get rid of rats! Here's your chance, act.

NORTH DAKOTA GRIMM ALFALFA SEED

Insure Against Winter Killing

First, by planting genuine Grimm alfalfa. Second, insist on our North Dakota grown seed which is 99% pure, scarified and free from noxious weed seeds.

Price $1.00 per pound postpaid
$0.70 per pound in 5-pound lots or more. Sacks extra. 50c.

GRIMM ALFALFA SEED PRODUCERS' ASSOCIATION OF NORTH DAKOTA
1147 Seventh St. N. Fargo, North Dakota
A purely co-operative, non-profit organization of over 150 growers

ings and, before hot weather comes, we will have in a complete plant for condensing the skimmilk. We will have a capacity of ten thousand gallons a day. This will be the first milk condensery of its kind in Louisville, in fact, the first in the South.

Kentucky. F. E. GILMORE.

Hold Cows Off Pasture

HOARD'S DAIRYMAN:—It is best not to turn the cows onto pasture at the first appearance of grass. The first grass may taste good but it is "flashy" and lacks substance. It may stimulate an increase in the yield of milk but the increase will be at the expense of flesh of the animal and the capabilities of the cow producing a heavy flow of milk for a long period of time. The grass which grows first in the spring has a laxative influence on the bowels and tends to exhaust the system, reduce the amount of flesh carried, and produce a disordered condition of the digestive tract which enfeebles the system for a long time.

I keep my cows off pasture until the grass has arrived at the point where it has substance and nourishment. I allow the cows to become accustomed to the grass diet gradually thus not taking any chances on the derangements of the system which are likely to follow if cows are permitted to gorge themselves with all the fresh, green grass they can hold the first day they are allowed to get a taste of it.

When the grass has reached the point when I think it best to turn the cows out I feed them the morning and noonday feedings of dry feed and then allow them to eat grass for a short time in the afternoon and then take them off the grass and give them their usual feeding of dry feed. The second day I allow them to eat grass a little longer and then remove them from the pasture and feed them as before. The period of eating grass is lengthened each day until the noonday feeding is dispensed with. However I continue the morning and evening feeding until the animals are well sustained by the grass consumed.

When the cows are first turned onto pasture I feed laxative feeds like wheat bran and oil meal sparingly. For the first ten days or two weeks after the cows are turned out to grass I give them only about one-half the quantity of salt they are used to receiving. By following the method here described there is no derangement of the system produced nor any appreciable loss of flesh sustained. The flow of milk must, from the nature of the feed consumed, be increased and the cows are enabled, if an abundance of grass is available, to keep up a steady flow of milk for a long period of time.

Illinois. M. E. UNDERWOOD.

Iowa Guernsey Association

HOARD'S DAIRYMAN:—The first Guernsey breeders' association to be organized in Dubuque County, Iowa, was formed March 7th when the men interested in Guernsey cattle met.

The meeting was held at the farm of Fred Kamroller which is the home of the Fairmont herd. The officers elected were: President, J. Allen Wallis; vice-president, Anton Osterban; secretary and treasurer, George Schumacher.

The plan is to hold the monthly meetings during the summer at the homes of the members, thus giving the members a chance to look over the different herds in the county.

A census of all Guernsey cattle in the county will be taken and all animals for sale will be listed with the secretary.

Durango, Iowa. J. A. W.

KING SEGIS PATENT LOCK

Ear Tags, Bull Staff and Rings. Description and prices sent on application. 300,000 of these ear tags have been sold without adverse criticism. 500 of these BullStaffs are used by the best breeders in the business.

H. A. Moyer, Syracuse, N. Y.

EDITORIAL COMMENT

FIGURES from Western Washington indicate that the average herd bull consumes in a year's time about 630 pounds of grain, 5,967 pounds of dry roughage, and 3,069 pounds of succulent roughage; forty-three pounds of bedding is used and 40.4 hours of human labor are required. In addition, there was an expenditure of $13.56 for pasture and $21.49 for other costs. On the farms where these figures were gathered, $20.32 was allowed for outside bull service.

ONE of the dailies of Detroit, Michigan, contains a notice to the effect that the municipality of Bombay, India, desires to secure the services of a man capable of superintending its suburban dairies. The person desired must have experience in the distribution of milk, dairy farm work, and the breeding of dairy cattle. He must be well educated and have such qualifications and experience as will enable him to organize the milk industry of that section. It is expected that the suburban dairies will ultimately contain twenty thousand milk cows.

Here is an opportunity for the person who is prepared to accept this position. It will mean a unique experience and the character of the work done in the Municipality Dairy of the city of Bombay, India, will be far reaching in its effect. It will undoubtedly mean revolutionizing the dairy industry of that country. It carries with it a large responsibility and no one should accept this important position unless he feels qualified to discharge his duties with credit to himself and to the city undertaking this venture.

GRADES AND PURE-BREDS

Some men believe grades are superior to pure-breds. These men have failed to ask themselves what makes the grade a good cow. Why is she superior to the cow of no breeding? There is only one answer to the question, "why is the grade cow a good animal?" and that is, because pure-bred blood flows in her veins. This does not mean that some grade cows are not superior to some pure-breds. Taking it by and large, the pure-bred must of necessity be superior to the grade, for it is the blood of the pure-bred that makes the grade what she is. Reasons for holding the views that grades are better than pure-breds may be attributed to the process of selection. If a grade cow does not measure up to the expectations of her owner, she is soon sacrificed; while if the pure-bred may not be quite what is desired, the owner feels he can improve this blood by the selection of a good pure-bred bull; and it is through the bull that improvement in all cattle is made. While it is true that some grades may produce more than some pure-breds, nevertheless without pure-breds we would not have grades. The pure-bred animals are responsible for the good grade cows, and that fact must not be overlooked.

FARM BUREAU WORK

Many members of our county farm bureaus are directly concerned regarding the financial return which they can make on their $10.00 investment. It should be remembered that the service which the farm bureau will render in legislative matters, in improving marketing conditions, in bringing about a better understanding of the relation of agriculture to other industries, and in popularizing agriculture in the minds of men engaged in other industries; in short, placing agriculture upon a proper business basis, will contribute more to the development of agriculture than the establishment of some co-operative enterprise for handling some particular commodity for local members.

It is well, however, for the officials of the farm bureau to give some attention to bringing about better methods of selling farm products locally and to assist their members to purchase commodities more advantageously. This does not mean that the farm bureau should go into business; in fact, we believe it should keep out of all business activities. It will impair its future usefulness the moment it enters business as a farm bureau. It is not organized for that purpose, and it has a bigger work.

A very good example of what the farm bureau can do to assist its members in purchasing commodities may be sighted in what one county farm bureau is doing. This particular county uses about 300,000 lbs. of twine yearly. Upon investigation it was discovered that by ordering twine in carload lots a saving could be made. The merchants of this county have shown a willingness to co-operate with the members of the farm bureau and will make a better price on twine provided they will take the twine from the car and pay cash for it. The farmers of this county will save, upon this basis of buying, better than $4,000, and the merchants will have pay for their service. Each will profit by this method of buying twine and that means a good bargain.

Another example: In this same county there are three or four creameries not far distant from each other. A firm recently desired a carload of butter from this locality and no one creamery could supply it, but through the assistance of the farm bureau a carload was obtained from the several creameries. A better price was received for the butter and a better freight rate was secured.

In this county it is the purpose of the farm bureau to use the local merchants for handling their products and purchasing their commodities, and so long as it can be done on the basis of a reasonable profit, no effort will be made to establish co-operative enterprises for carrying on this work. This farm bureau is assisting in bringing about a more efficient distribution of commodities and marketng farm products and is not engaging in business.

LEGISLATION FOR AUCTIONS

The Thirty-first Legislative Assembly of the state of Oregon enacted two laws to prevent by-bidding, fictitious bidding, and otherwise dishonest practices of the public auction sale of pure-bred live stock. We commend the purpose and object of these measures. It will not be possible in all instances to stop evil practices but it is possible, with the help of every honest and sincere breeder of pure-bred live stock, to minimize them to a negligible degree.

Following the motto, "The Buyer Beware", is not good business. There must be in the minds of all men interested in securing better dairy blood a confidence in those developing and improving dairy blood. Without this confidence the live stock industry suffers.

Congressman McArthur, of Oregon, prepared the bills which are now enacted into laws in the state of Oregon and, in writing us, has made in part the following comments:

"I have watched the conduct of auction sales of pure-bred live stock in Oregon and elsewhere with great interest, and find that there has been much downright dishonesty in the conduct of many of these sales. Animals have been run through the ring, sold for fictitious values, and by-bidding has been frequently practiced. These dishonest sales are not confined to any one state or to any one breed, but are more or less general in their existence. The business of raising and selling pure-bred live stock demands a high standard of ethics, and these dishonest breeders and dealers who have been carrying on their nefarious work ought to have due notice that the honest breeders of the country intend to call a halt."

The reasoning of Congressman McArthur is sound and every good breeder will approve his position. It is highly gratifying to note that the leading public auction sales managers have recognized that a high standard of ethics must be practiced, and they have accordingly adopted rules and made guaranties in keeping with square dealing. It is their purpose to establish a confidence in the minds of the public by placing their sales upon a proper and honest business basis. It is to the financial interest of every good breeder that by-bidding, fictitious offerings, and other dishonest practices be eliminated from the public auction.

BRAND REACTORS

Too many cattle proved tubercular by the test find their way into new herds as having clean bills of health. If we accept the statement, "once a reactor, always a reactor" as axiomatic, there is need to make certain that reactors are either slaughtered immediately after the test or at least so marked that they may be known for what they are.

Flagrant abuse of the knowledge gained through testing comes to us in recent testimony. In a herd where the tuberculin test was applied last April eleven diseased animals were discovered. The herd was sold in the fall and all of the eleven reactors were offered for sale as being free from tuberculosis as evidenced by a test just previous to the auction. Some animals were held out because of reacting to the second test—which indicated that the disease was in the herd. A prospective purchaser checking the tests in the state veterinarian's office identified the eleven cows in time to prevent their sale—perhaps into clean, healthy herds or to beginners.

In another case three cows were shipped interstate and reacted on retest. They were later "retested" again by a local veterinarian, found "clean", and offered for sale.

In still another case a buyer brought his purchases together in the shipping yards and had them tested. Seven in one carload reacted, were tagged, and rejected. The next day the buyer found two of the seven in another railroad yard, the tags torn out of their ears and the cows billed for inter-county shipment to another purchaser.

The buying public must be protected from such fraud. When one such animal may "salt" a herd, provision must be made for unmistakable identification of all reactors.

It is not enough that rules are laid down which are presumed to take care of this matter. Reactors should be so branded as to be readily recognized.

A MILK CAMPAIGN

Madison, Wisconsin, has recently completed a milk campaign which has proven highly satisfactory to those responsible for it. This campaign was carried on in a most unique way and the methods used for carrying the message of the food value of milk to the people of that city were effective.

Through the assistance of Miss Hoover of the Dairy Division and the Extension Department of the University of Wisconsin, the various women's clubs, schools, churches, and, in fact, every organization having to do with the welfare of the people were organized and had a part in this campaign. The merchants entered into it with a spirit highly commendable to them. Their windows were appropriately decorated and prizes were offered to those who excelled in skill in building milk displays.

There is no way so effective in carrying on an educational campaign as to secure the services of those interested in the welfare and development of the people. This campaign was successful because many persons were given something to do. Its cost was nominal but the results were far reaching and effective.

A Poor Alfalfa Stand

Last fall I put in an acre of alfalfa and from the appearance of the plants it does seem as though I will have an excellent stand. In this field every fall and winter a chick weed covers the ground just like a carpet. Will you kindly advise me just what you would do to eliminate this weed? Can I spring tooth this alfalfa field to get rid of weeds? Would it be advisable to use some pulverized sulphur on this field?

Chevy Chase, Md. J. B. W.

We would suggest that the soil be tested for acidity. This can be done by using a strip of litmus paper. If it turns red it is an indication of an acid or sour soil. If this condition prevails, lime in some form should be used. It is also possible that alfalfa needs inoculation. There is also a possibility that the land lacks something in fertility which makes it more difficult to get a stand of alfalfa.

If practical, we would suggest that this field be given a light top dressing of manure in case the stand is of such character as would make it seem desirable to hold the alfalfa for this year. It might be well, prior to making the application of manure, to use the spring tooth harrow in cultivating the alfalfa. This should be done in the early spring or after the first hay crop is cut. There is some danger that the alfalfa, if small, will be uprooted if harrowing is done when the ground is soft.

It is possible that the application of sulphur at the rate of 100 lbs. per acre or of land plaster or gypsum at the rate of 200 lbs. per acre may be of assistance in improving the alfalfa crop. This has been found very useful in the far western states but it is held by many investigators in the Middle West that for relatively humid climates, sulphur is not one of the factors limiting crop production.

Seeding Clover in Spring

I plowed a hay field last fall that was badly run out and starved of fertility, sowing it to rye on the sod. I did this intending to seed the same to clover this spring. On account of the crop not being protected with snow, I am afraid the rye is killed. In case it is, what crop can I sow this spring that will make good cow feed? Can I sow a crop and seed it to clover?

Oshkosh, Wis. T. R. A.

It is quite possible that the rye will have stood the winter weather better than now anticipated. In fact, if the weather has thinned it out somewhat, there will be greater certainty of securing a good stand of clover if seeded as soon as possible with a hand seeder instead of waiting for the land to be in condition for using a horse drawn seeder or drill. If desired to reseed the field to another crop, we would suggest that possibly peas and oats may give as good a return as anything in the nature of a substitute hay crop. Seeding may be done at the rate suggested on page 367 of our issue for March 18. The use of soy beans for hay is also discussed in that issue.

A suggestion comes from New York State that 10 lbs. of hairy or winter vetch be added to the usual spring seeding of oats, timothy, and clover. The purpose of this is to supply additional value to the oats when cut as hay and also provide a somewhat quicker growing legume crop than the clover itself. It is reported that a fair second crop of vetch hay can be secured the same year and that this is not done at the expense of a good catch of clover.

Three-horse Hitch

I certainly am surprised at Wayne Dinsmore's answer to the question "How to hitch three horses to a two-horse plow without side draft". He says it can't be done except in tandem. Any 12-year-old boy in Southern Illinois on a farm knows better. Three horses can be hitched to any kind of a one-bottom plow outfit with no more side draft than there would be if one horse were hitched alone to the same plow.

Golden Gate. G. A. M.

On every plow, whether one bottom or more, there is a point of hitch termed the "center of draft" and when the hitch is made at this point the plow pulls with less exertion than when the hitch is made at a point more distant from the furrow; and whenever an effort is made to hitch three horses abreast on a single bottom plow with one horse in the furrow and two on the solid land it is necessary to hitch at a point further away from the furrow than the point at which the plow operates with the minimum pull and this extra load, due to failure to hitch on the true center of draft, is designated as side draft.

It is evident from the comment of your subscriber that he does not know what I have just stated and he probably will not believe this when he sees it in print but any trained engineer who has made dynamometer tests recording accurately the pull required to operate plows with the point of hitch at different distances from the center of furrow will bear out my statements.

Illinois. WAYNE DINSMORE.

Cost of Condensed Milk

Could you state in your paper how much profit a condensery makes if it pays $1.90 a hundred pounds milk testing 3.8% and sells a case for $5.75 wholesale? Could I get bulletins of colleges or Department of Agriculture on this subject?

Bellingham, Wash. C. R.

We do not know of any bulletins that have been published which give the cost of manufacture of condensed and evaporated milk. This is an item which would vary considerably from factory to factory, according to its organization, size, capacity of machinery, and the amount of output. This will be further modified by the varying costs of labor and other elements entering into the manufacture of the product. Professor Hunziker, in his book entitled "Condensed Milk and Milk Powder", takes up a very complete discussion of this subject.

Professor Hunziker reports that on January 1, 1920, the average cost of producing a case of evaporated milk weighing 48 lbs., net, was $6.09. This was based on milk selling at $3.60 per hundred; and requiring 106 lbs. whole milk for a case, the milk cost was approximately $3.82. The other costs of manufacture amounted to $2.27, which included cans, boxes, labels, coal, labor, administration and selling expense, freight, and interest and insurance on investment and on operating capital. For a case of sweetened condensed milk weighing 42 lbs. he gives a total cost of $8.54—of this, $3.78 is for 105 lbs. of milk at $3.60 per hundred and $2.64 for 16.8 lbs. of sugar at 15¾c per lb., which makes the cost of manufacture and selling, aside from sugar and milk, amount to $2.12 per case.

It is quite possible that condenseries that are now operating under normal conditions can manufacture somewhat cheaper than they did a year ago, but accepting these figures as approximately correct, it would appear that with milk selling for $1.90 per hundred, evaporated milk could be sold at wholesale for $4.27 per case. This does not necessarily mean that with evaporated milk selling for $5.75 per case, the profit would be nearly $1.50 per case. It is possible that there are additional selling expenses for advertising, etc., that may become a proper charge.

If it is desired to go into a rather complete analysis of the condensed and evaporated milk business, we would suggest a study of Hunziker's book, entitled "Condensed Milk and Milk Powder". This is the best reference book on this subject that we are advised of; in fact, it is the only data available in anywhere near complete form. Our Circulation Department will be pleased to supply this upon receipt of its regular price, $5.75.

Tuberculosis and Health Certificates

Does any state require that cattle be federally accredited before they can be shipped in? What are the tuberculosis laws or regulations in Oregon relative to the importation into that state of dairy cattle?

Hillsboro, Ore. C. W. S.

No state that I know of requires that cattle be from federal accredited herds before they can be shipped in. However, several of the states require that cattle from certain other states be tested by the United States Bureau of Animal Industry to be admitted. We quote the law pertaining to the importation of cattle into Oregon as given in the booklet compiled by the United States Department of Agriculture and issued January 22d, 1920.

"Cattle.—Health certificate, except for animals for immediate slaughter, including tuberculin test for all dairy and breeding cattle. All cattle except settlers' and homesteaders' effects brought into Oregon from the territory east of the Mississippi river and north of the Tennessee—North Carolina north boundary line must first receive a written permit from the state veterinarian to be moved into the state before such movement can be made. All cattle originating in the states of New York or Wisconsin must be tuberculin tested by a federal veterinarian unless otherwise ordered. All cattle from Illinois must be tuberculin tested by federal veterinarians or by a veterinarian approved in writing by state veterinarian of Illinois."

This will explain more fully what is meant by my statement above, as you will note that all cattle originating in the states of New York and Wisconsin must be tuberculin tested by a federal veterinarian unless otherwise ordered, and cattle from Illinois tested by federal veterinarian or veterinarian approved in writing by the state veterinarian of Illinois. However, cattle from herds that are under federal supervision are usually given preference by the live stock sanitary officials of states, although the exception is not made in the law. For instance, cattle from federal-state herds are not subjected to the sixty-day retest in Minnesota which is required by law.

JAMES S. HEALY.
U. S. Bureau of Animal Industry.

Sunflowers and Frost

How do sunflowers stand the frost? Can sunflowers be planted together or in alternate rows with corn? Can they be mixed with the corn when put in the silo? If not mixed, which should be ensiled first?

Millvillage, N. H. D. B.

Sunflowers are not so badly injured by frost as is corn. This holds true not only of the spring frosts but also those which occur later in the fall. Corn which is hit by the frost seldom makes any growth afterwards and many of the leaves dry up and are wasted. Sunflowers seem to be able to stand the frost better and will continue growth when the corn is stopped by an early frost.

Sunflowers and corn can be planted together but our personal experience leads us to the opinion that it is preferable to plant them separately. This is merely because the sunflowers make a larger growth and the resulting bundles of short and long stalks are very inconvenient to handle. In ensiling they can be mixed by running a load of sunflowers and then a load or two of corn, or the two can be kept entirely separate. It is immaterial whether the sunflowers are put at the top or the bottom of the silo. There are good reasons for both practices. It is held by some growers that if they are placed at the bottom, they will gain something from the juices of the corn, while others hold that the sunflowers make a better top covering because of their weight and the fineness to which the cutting reduces them. They pack very closely together in the silo and all things considered, this may be the best practice. Perhaps the best rule to follow would be to ensile each crop at the time it reaches maturity, and corn is likely to be first because of frost doing it the greatest damage.

Bitter Milk

Our cream and butter has a strong taste. We wash the udders and our hands and keep our cows clean. We feed grain two times a day, cornmeal, bran, and a handful of oil meal and a little salt. We give them alfalfa. We milk dry handed and keep our milk room absolutely clean.

Wayzata, Minn. E. W. T.

Bitter or strong tasting milk is usually produced by only a few cows in a herd. If these can be identified through the saving of samples of milk from each cow, it is unnecessary to contaminate the whole herd supply by including their milk.

Bitter milk is rarely produced by cows receiving green feed or by those which are fed liberally of silage. The peculiar taste, which may be described as salty or bitter, is noticeable when the milk is drawn and becomes much worse as the milk ages. The temperature at which the milk is held has no influence, which indicates that the abnormal taste is not due to bacterial growth. Animals which are in very high flesh, particularly those being fed heavily of grains, are those which are most apt to produce bitter milk. Also the trouble is most common with cows which are far advanced in lactation.

The treatment recommended is to reduce the grain fed rather sharply and give two or three doses of Epsom salts at intervals of three days. In most cases this will remove the difficulty. The dosage of Epsom salts recommended is one to one and one-half pounds.

Contents of Silo

A has two silos, one 12x30 ft. and one 12x42 ft. B has one silo, 14x55 ft. Which has the greatest capacity in tons?

Egg Harbor, Wis. A. B. H.

The two 12-foot silos if filled completely, would contain approximately 161 tons. The 14-foot silo, when filled to its full depth of 55 feet, would contain approximately 173 tons.

Fighting Tuberculosis in New York

HOARD'S DAIRYMAN:—The eradication of bovine tuberculosis from the dairy herds of this country is not a matter of concern only to those who keep cows. It is of equal importance to all of the people, as much so as the eradication or control of any of the infectious diseases of animals or humans, and therefore it is entirely proper that the state and federal governments should be mutually interested and concerned in the problem of its eradication and in co-operating with the breeders to this end. This, to be sure, is what is being done but the magnitude of the job has not been sufficiently impressed upon the people. The average citizen, the average dairyman, yes, even the average breeder of pure-bred animals, has not yet become sufficiently conversant with the situation.

The job of eradicating bovine tuberculosis from the herds in New York State, or any other state for that matter, can be pursued to its finality only by the continued co-operation and supervision of the state and federal authorities. And arguments advanced to prove that the appropriation of public funds to assist the breeders of live stock to eradicate this disease is class legislation, is as weak as to argue similarly that public funds should not be appropriated for the prevention of any disease that is a menace to the health of the people. Certainly the maintenance of the dairy industry is nearly as vital to human welfare as the maintenance of the wheat growing industry. Should the dairymen at this time be obliged to stand the entire loss for those animals killed because of being tubercular, a disease which they could not foresee, they will wisely discontinue the business and take up some other line of farming.

The dairymen of New York State are in the midst of a campaign to clean up their herds and regain a reputation that has been, in part, lost on account of diseased animals in their herds. Most of those who have already had their herds tested are awake to the enormity of the job from a state-wide point of view. The job looms bigger the more one comes in contact with it and yet all agree there is no other way out. Therefore the only thing to do is to plan for the future and pursue this plan with diligence. The breeders know full well that there is no future for them in raising pure-bred animals that are to be constantly exposed to diseased individuals. They know that the tuberculin test must be applied, and although instances have occurred where it has seemed as though the test was not infallible, it is accepted by purchasers and has the stamp of approval of the state and federal authorities. All of this knowledge of conditions and facts strengthens their faith in the work.

Within the past eight months the number of breeders who have signified their desire to have their herds tested, with the thought constantly in mind to have eventually "Federally Accredited" herds, has increased by great strides. So large is this number that the authorities have not a sufficient number of veterinarians in their employ to keep up with the demand for service. Therefore it is rapidly becoming the practice for the breeders in a county to get together, especially those who desire to have their herds tested, and by agreement create a disinterested committee with authority to employ, with the approval and co-operation of the authorities, a qualified veterinarian to test these herds. These men are spoken of as county veterinarians. Each breeder desiring his herd tested applies to the committee and advances the necessary fees to pay all costs incident to the testing until such time as his herd has been duly "accredited". The committee pays the veterinarian and directs his work, which is of course supervised by the state and federal authorities. Even with such a man devoting his entire services to this work the number of breeders requesting to have their herds tested is increasing more rapidly than the veterinarians can make the tests.

Under the existing laws those animals condemned and appraised will be paid for in accordance with the law and the rules governing the work. It is well known that the funds actually appropriated for this work for the fiscal year ending June 30, 1920, have been used up. The obligations of the state incurred since that time will have to be met from appropriations yet to be made. Meanwhile there seems to be no practical way by which the breeders can receive the state and federal indemnities until more funds are appropriated for this particular purpose. It has been thought that some plan could be worked out whereby these claims for indemnities, against the state for example, might be offered as collateral to banks and thus make it possible for a breeder to secure the indemnity funds sooner so that he could replenish his herd with purchased healthy animals, but this plan has not yet become effective.

Meanwhile the New York State breeders are laying out their battle lines to fight the bovine tuberculosis menace to a finish. They are beginning to realize that it is going to mean a long fight, but if they can win they know that the future of the industry is saved to the state. If they do not fight, the other alternative stares them in the face: namely to go out of the breeding business. Human sympathy in common adversity has its blessings for it makes the burden easier to bear. Likewise the courage and faith that springs to life in men who combine to fight a common enemy is greatly to be valued at this time. There can be no going back nor standing still.

The bovine tuberculosis fight must be won or the breeding of high class dairy cattle in New York State is doomed.

New York. F. E. ROBERTSON.

Milch Cows in the United States

The United States Department of Agriculture estimates that on January 1, 1921, there were approximately 25,000,000 horses and mules in the United States; 23,321,000 milch cows; 42,870,000 other cattle; 45,067,000 sheep; and 66,649,000 swine, This report shows a decrease from the previous year of slightly over 1 per cent in milch cows running up to 7 per cent in swine. The total values of all live stock, according to this estimate, declined over two billion dollars, or nearly 27 per cent during the year.

The following table gives the number of milch cows on January 1, 1921, and 1920 for each of the several states:

State	1921	1920
New Hampshire	171,000	176,000
Maine	101,000	103,000
Vermont	275,000	275,000
Massachusetts	157,000	159,000
Rhode Island	18,000	19,000
Connecticut	117,000	118,000
New York	1,448,000	1,493,000
New Jersey	151,000	151,000
Pennsylvania	951,000	970,000
Delaware	45,000	45,000
Maryland	180,000	180,000
Virginia	428,000	428,000
West Virginia	245,000	245,000
North Carolina	331,000	328,000
South Carolina	215,000	213,000
Georgia	470,000	461,000
Florida	156,000	156,000
Ohio	1,009,000	1,030,000
Indiana	727,000	734,000
Illinois	1,028,000	1,060,000
Michigan	856,000	873,000
Wisconsin	1,828,000	1,846,000
Minnesota	1,395,000	1,395,000
Iowa	1,252,000	1,291,000
Missouri	873,000	919,000
North Dakota	464,000	464,000
South Dakota	539,000	561,000
Nebraska	560,000	577,000
Kansas	898,000	935,000
Kentucky	446,000	457,000
Tennessee	386,000	390,000
Alabama	507,000	502,000
Mississippi	571,000	571,000
Louisiana	382,000	378,000
Texas	1,184,000	1,138,000
Oklahoma	549,000	560,000
Arkansas	429,000	452,000
Montana	185,000	185,000
Wyoming	80,000	80,000
Colorado	272,000	272,000
New Mexico	91,000	87,000
Arizona	45,000	50,000
Utah	108,000	109,000
Nevada	32,000	31,000
Idaho	137,000	136,000
Washington	216,000	225,000
Oregon	216,000	220,000
California	577,000	571,000
United States	23,321,000	23,619,000

The Department estimates that milch cows were worth $64 per head on January 1, 1921 as compared with $85 in 1920, $78 in 1919, and $70 in 1918.

When New Yorkers got their lumber from their own pine forests, transportation costs were a dollar a thousand feet, and upper grades cost $20 or $30. Today New Yorkers must pay $9 a thousand to transport lumber from the south, and $20 to get it from the Pacific Coast. Just think of these facts when you consider whether it is worth while to raise timber.

Uncle Ab says: He knows of no nobler altar than the hearthstone of an open fire in an American home.

MARY JANE OF GERAR, SEVENTEEN-YEAR-OLD GUERNSEY WHICH RECENTLY DROPPED A CALF SIRED BY LANGWATER ROYAL 4TH, A SON OF HER DAUGHTER, GERAR PEARL

This calf will be used as the future herd sire at Gerar Farm, Maryland. Mary Jane of Gerar made 495 lbs. fat at eight and a half years of age, 694 lbs. at nine and a half years, and 697 at eleven years.

A Great Bull "to Show People"

The Daughters of Ormsby Korndyke Lad Proved His Worth and Possibly Saved Him From the Shambles

THE story of a great bull slaughtered before his daughters had an opportunity to prove his worth has been told scores of times, with scores of different bulls as the central figures. The story of Ormsby Korndyke Lad is like that in some respects and, fortunately for the Holstein breed, very unlike it in others. He was not slaughtered, but his worth for a long time was unrecognized and several years of his life were wasted.

Six or seven years ago Julius Schmid of New York began the building of a breeding establishment known the country over today as Beaver Dam Stock Farm. At the time, as he himself admits, he knew practically nothing about Holsteins. On the advice of a neighboring breeder he bought of that breeder his half interest in Ormsby Korndyke Lad, a sorry specimen of a bull, underfed and lame. At about the same time he purchased five heifer calves by this bull, paying $450 for them.

When he got the bull home, Mr. Schmid was still undecided about his use. He asked other and more experienced breeders about it and one of them not only advised against using "O. K. L." but succeeded in selling him another bull to be used on the Beaver Dam herd. Fortunately "O. K. L." was not sent to the shambles. As Mr. Schmid says, "He was a good looking bull when we had fed him up. I kept him to show people, but the other bull did the work."

So, for nearly two years this great sire was bred to but one cow. But in the meantime those five heifer calves were growing up and, in spite of lack of care, the first one to freshen made a 21-lb. seven-day butter record and started off wonderfully well on year test. She was none other than O. K. L. Pearl Tula, today one of the old bull's best known daughters, with a mature production of 27,398.2 lbs. milk containing 1,093.4 lbs. fat.

The performance of this first daughter to freshen opened Mr. Schmid's eyes to the value of the bull which had been given so humble a place in the herd. Thereafter "O. K. L." began to get a chance to really prove his worth.

Two years of this famous Holstein sire's life were thus entirely wasted and the calves sired during his earlier years were scattered far and wide, many of them never tested, so that when he died in August, 1920, a majority of his daughters at Beaver Dam were heifers. Consequently comparatively few of his daughters have been tested and yet he had at the end of 1920 more "1,000-lb." daughters than any other sire of the breed.

ORMSBY KORNDYKE LAD, FAMOUS HOLSTEIN SIRE WHICH WAS OWNED BY BEAVER DAM STOCK FARM

Since that time an equal number of the daughters of Sir Pietertje Ormsby Mercedes have made the 1,000-lb. class, each now having 14, a number equalled by no other sire. The daughters of the Beaver Dam sire, kept for two years to "show people", now hold the records for New York State for both milk and fat in the classes for aged cows, senior four-year-olds, and senior three-year-olds, and the record for milk in the class for senior two-year-olds. Mr. Schmid says, "We have made more progress in three years with the offspring of Ormsby Korndyke Lad than we did in twelve years previous spent in breeding Holsteins." With about 60 daughters still in the Beaver Dam herd and over half of them not yet in milk, there is yet a wonderful opportunity for "O. K. L.'s" record to be greatly increased.

Nor was this bull only a sire of producers. His daughters are splendid looking dairy cows. Go through the herd and you can pick them all—those from good dams and those from poor ones. They are wonderfully alike, with fine horns, shapely heads and bodies, and good udders. Their sire is a lesson for any breeder. As it happens, Mr. Schmid bought him for a song, but he would still have been cheap at several thousand dollars, for not less than $150,000 has been received by Beaver Dam Stock Farm for his offspring.

It is wise not only to buy a good bull but to try him out early in life. If his daughters early prove his worth, it is worth while and gives further opportunity for his use. If they disprove his worth, time and money both are saved.

Bran Prices

HOARD'S DAIRYMAN:—The spring price outlook for bran and shorts lacks the air of bullishness so often apparent at this season. The market presents a sharp contrast to the skyrocketing movement during the spring and early summer seasons of a year ago. In asking a dealer or a miller about the market for bran, the reply today is "around $21 a ton sellers," that is, prospective sellers are willing to offer the product at this price. Unlike the extraordinary experiences of a year ago, one seldom hears that the market is without offers. Now it is a buyers' market.

Past records of the feedstuffs industry show that advances in prices for bran and shorts usually occur after the close of the winter season, with the peak of values reached between the early part of April and the middle of May. Such a tendency of prices has made it profitable for both dairymen and hog producers to accumulate stocks of bran and shorts for two or three months' requirements, often enough to carry stock well into June. This year, however, there is a marked absence of buying among the consuming trade for deferred requirements. Instead, the dealer or other handler of feeds who can offer a small sized car of bran and shorts, or a mixed car containing only a comparatively small amount of mill offals, usually obtains the order.

Hesitancy on the part of the consuming trade in buying bran and shorts, while possibly uncommon for this period of the year, is not a new experience for recent months. Virtually since the opening of the crop year last July the trade has bought very sparingly, and, as the prices moved downward with rapidity, the buying on a restricted scale became more and more intensified. There is yet an enormous amount of various feeds remaining on farms of the country, particularly in the sections which are normally important buying outlets for bran and shorts. Corn, for example, which is selling around 40 to 45 cents a bushel in the larger hog producing sections, is being substituted quite extensively for shorts for which farmers must pay around $28 a ton delivered, or fully $10 a ton more than corn. The stocks of both corn and oats are the largest in history, which, in view of the low prices prevailing for the coarse grains on markets, is naturally a stimulant to their more general use. The early pasture season and the generally excellent condition of grass also make for a reduction in the consumptive demand for bran.

The buying of bran and shorts, particularly the lighter offal, by another important outlet, the commercial mixed feed manufacturer, also has been sharply curtailed. The mixer is operating on a far, far more restricted scale than a year ago or at any time the past few years. Because of the relatively low price of the whole grains, the concentrates, and various other feedstuffs, the mixer has been at a serious disadvantage in finding an outlet for his production. Nor is it probable that the feed mixer will assume a more outstanding position as a buyer during the remainder of the crop year. To the contrary, there is reason for the belief that the market for mill feeds will feel to a greater extent within the next three or four months the absence of demand from this industry.

Still another phase of the demand situation requires consideration as a possible bearish or bullish price influence. Absence of the southern cotton planter from the market will lessen considerably the normal strain in the trade. The cotton planter and other consumers of the cotton belt could make excellent use of bran and shorts. Of this there is no doubt. But the South is in a serious position as regards credit because of the declines in cotton, and it is necessarily restricted to a remarkable extent in the purchase of the feeds. The South is buying on a far smaller scale than normal for the early spring.

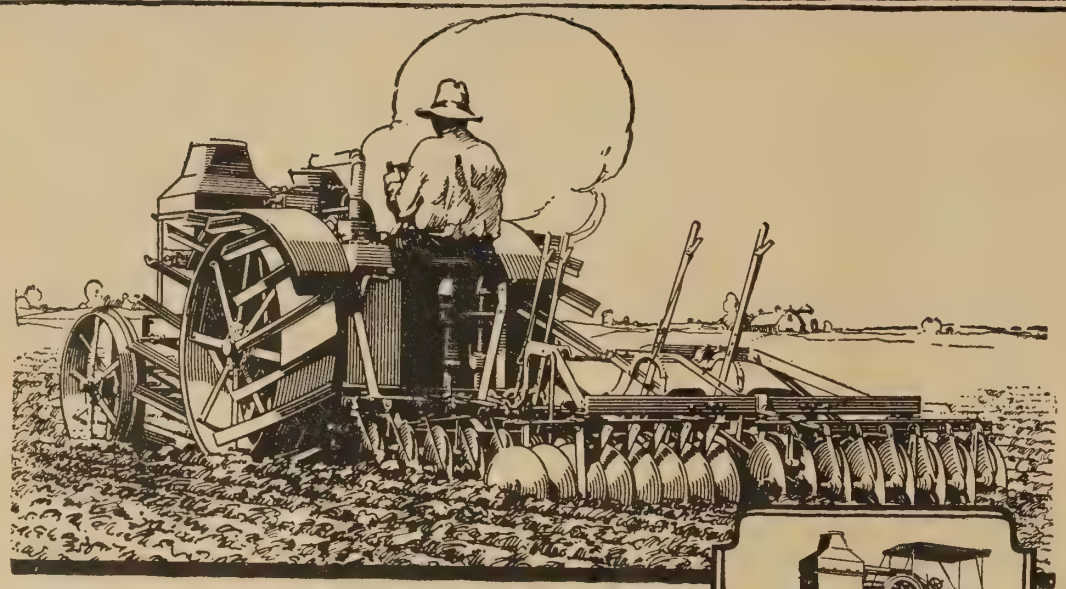
The strongest argument for a bullish bran and shorts market is the probability of a material reduction in the output of milling plants in both the spring and winter wheat sections. Demand for flour usually slackens around this period of the year, with a resulting falling-off in the activity of milling plants. Still, the flour consuming trade has followed a policy of buying on a hand-to-mouth basis, and, without an accumulation of stocks in hands of the larger trade, there is some doubt as to any further falling-off in production. The mill output for some months has averaged hardly more than fifty per cent of normal. Any very meager reduction in the output by mills will probably be offset by the offerings of bran and shorts which have been placed in storage by millers and speculative jobbers in anticipation of the usual spring rise in prices.

Despite what appears to many as an extremely bearish prospect for the wheat mill feeds, such an attitude is not particularly advisable for the present, no more so, in fact, than the opinions of some bullish operators who are talking a bulge of more than $5 a ton. The fact stands out quite significantly that some consumers, including both dairymen and hog producers, will be slow to turn away from the use of bran and shorts during the spring period irrespective of the relatively high prices for the offals or the abundance of other feeds available in their immediate locality. This may be sufficiently general to sustain values, though hardly permit of even a small bulge during the season of heaviest feeding, until about the middle of May. But consumers can anticipate with only a small degree of doubt that bran and shorts will sell at a considerably lower level by the time the new crop year approaches in July.

Missouri. SANDERS SOSLAND.

Handy Hitch for Wagon to Auo

HOARD'S DAIRYMAN:—Some days ago at a public sale I saw an auto drive up trailing a farm wagon. A cow was loaded in and the outfit started home at about 8 miles an hour. I noticed how the wagon was hitched to the machine because so often the manner of hitching makes trouble.



A farm doubletree was tied just inside of the loop of the rear springs. Then the tongue of the wagon was wired with heavy wire to the center hole of the double tree. This made the wagon pull straight in the track and allowed it to turn the corners without maring anything about the auto body.

Ohio. EARL ROGERS.

Must be silos pay. Only one-third of the farms in New York State have 'em, but two-thirds of the cows of the state are kept on these farms.

Colantha Changeling Mooie, a senior 3-year-old Holstein cow which has made 614.2 lbs. milk, 25.17 lbs. fat, in 7 days and, in 30 days, 2706.4 lbs. milk, 103.66 lbs. fat. She is owned by John and Chas. Wittig of Wisconsin.

How long do you expect a tractor to last on *your* farm?

You buy a tractor for lasting, unfailing, economical power.

You want a tractor that not only does the most work *each season* with the least trouble and expense, but also gives the *greatest number of years* of this kind of service under your own farm conditions.

It is hard to state the life of a tractor because of the scarcity of actual, authentic records. Some authorities put it at seven years. It is still harder to state the life of an OilPull tractor because the first OilPulls built are still "going strong" after *twelve years* of hard and continuous work.

Many of the owners of these veteran OilPulls express a firm belief that their tractors will last still another decade before their usefulness is impaired.

The great length of life of OilPull tractors is largely due to the fact that in the first place they were designed and built for unusual long life — tremendous strength in every part, a great reserve of power, double assurance of dependable lubrication, splendid design, absolute insistence on the highest quality of materials, super-exacting inspection and test. OilPull tractors are produced by a company that has been building long life into power farming machinery for over eighty years.

The OilPull tractor supplies the economical power required for the most efficient handling of your farm work.

Four sizes—12-20, 16-30, 20-40 and 30-60 H. P.

We, or your Advance-Rumely dealer, will supply complete details.

LaPorte, Indiana

29 Branch Offices and Warehouses

Since 1911

This old OilPull tractor, No. 394, owned by A. L. Dugan, McCracken, Kan., was built and sold over ten years ago. It is but one of the many OilPulls, built ten, eleven and twelve years ago, that are still upholding the OilPull reputation for unequaled performance and long life.

Old No. 394's career has been noteworthy. It has turned thousands of acres of Kansas sod and many more acres of stubble land. It has builded and graded hundreds of miles of Kansas road. And altogether during this decade's work it has threshed a full year and a half, averaging over fifty days of threshing for ten years.

The original factory equipment, with few exceptions, is still intact in old No. 394.

Doubtless, there is a veteran OilPull in YOUR locality. Ask us or your Rumely dealer about it.

Electricity for Farm Lighting

(Continued from page 450)

age, are cheaper, that fewer are needed for a given plant, and that the internal condition is more easily determined than in the nickle-iron cells. In spite of their greater first cost the nickle-iron cells are probably the better investment for the average user.

The small individual lighting plants are generally rated according to the amount of current they will deliver during a certain period, usually eight hours. Thus an eighty ampere hour plant will deliver a current of 10 amperes for 8 hours, or 8 amperes for 10 hours, or 1 amper for 80 hours. When one ampere of current is propelled by one volt pressure the result is one watt of power. This unit is so small that it is usually multiplied by 1000 and is then known as kilowatt, which is equal to 1.34 horsepower or 746 watts equal 1 horse power. A ¾ K. W. (kilowatt) generator will deliver practically one horse power. Most generators are designed to stand a 50% overload for some time without damage.

Most electrical appliances, such as lamps, motors, percolators, flat irons, etc., have their current consumption rate or wattage stamped or otherwise marked on them somewhere, so that it is simply a matter of figuring to determine how many of them can be used and for how long a time. For example, with the cells of an 80 ampere hour battery fully charged and delivering current at 32 volts, how long can an electric flat iron drawing 525 watts, an electric motor delivering one-sixth horse power, and six 25 watt lamps be operated before the battery will need recharging. Remember, watts equal volts times amperes; amperes equal watts divided by volts; volts equal watts divided by amperes; horse power equals watts divided by 746; and a kilowatt equals 1000 watts. The example given above is worked as follows:

The 525 (watts used by the flat iron) divided by 32 (volts in current) gives 16.4 amperes.

A one-sixth horse power motor will use 124 watts (one-sixth of 746), and this divided by 32 (voltage) gives 4 amperes.

The six 25-watt lamps will use a total of 150 watts, and this divided by 32 (voltage) gives 4.7 amperes.

The total amperes are 25.1. As the storage battery will supply 80 amperes, it will run the above equipment for 5.2 hours (80 divided by 25.1). This battery is discharging at a high rate, the usual discharge being about 10 amperes per hour.

This same 80 ampere hour battery will keep one 25-watt lamp burning 102½ hours, or 10-15 watt lamps burning something over 17 hours.

Perhaps the most important single feature about a small lighting plant is the storage battery. It is not any too long lived at best and it may be badly damaged if not absolutely ruined by improper usage. All cells of whatever kind have a normal charging and discharging rate and these rates must not be exceeded if the battery is to last any length of time. Most lead cells have a discharging rate of about 10 amperes but the manufacturer always gives the rate and this rate should be followed. The rate depends entirely upon the size and number of plates in the cell.

When a cell is charged too rapidly one of the plates goes into solution faster than the other plate can take it on evenly. The result is that a certain amount of sediment will form at the bottom of the jar and the negative plate will build up so rapidly that it will tend to warp. If the discharge takes place too rapidly the same condition will prevail except that the posi-

tive plate will tend to build up too quickly.

With the ordinary plants the greater danger is in overdischarging or in discharging too quickly. Most plants are so designed that the batteries cannot be charged at more than their normal rate and when fully charged the engine is stopped. There is, however, no way of preventing the overoading of a battery. In general the discharging rate should never exceed the charging rate. With the average ¾ K. W. plant it is advisable to run the engine whenever an electric flat-iron is being used. Most plants are equipped with some sort of device which will either automatically stop the engine when the battery is full or will indicate that fact by setting a bell to ringing or light a lamp or in some other way attract attention. On the other hand, the first intimation that the battery is empty is too often given by the dimming lights. Whenever a battery is discharged till the voltage drops below a certain standard, depending on the cell, considerable damage is done if the discharge is allowed to go farther.

Another very important thing in connection with a low voltage lighting outfit is to see that the wires are large enough. The necessity for large wires can be shown by again referring to the likeness in principle to water under pressure. Water flowing from a half-inch pipe will fill a barrel in 10 minutes, say, if the pressure is 50 pounds per square inch; if the pressure is reduced to 25 pounds per square inch it will take 20 minutes to fill the same barrel. The quantity of water delivered is then directly proportional to the size of the pipe and the pressure. The following statement speaks for itself; if the pipe (wire) is small the pressure in pounds per square inch (voltage) must be higher to deliver a certain number of gallons in a given time (number of amperes).

The allowable capacity of various sized wires has been determined by the National Board of Fire Underwriters and should be followed. The capacity of a few of the more common sizes is as follows:

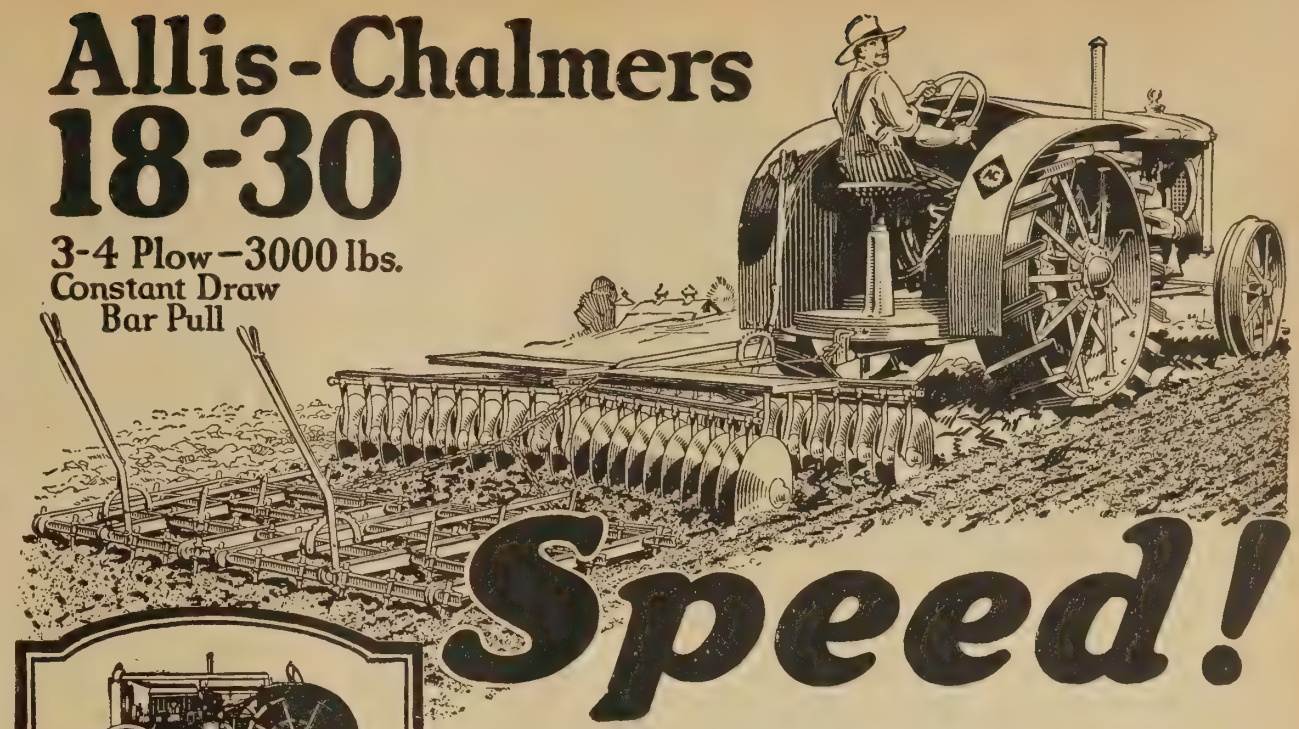
Size of wire Number	Rubber insulation Amperes	Other insulation Amperes
18	3	5
16	6	10
14	15	20
12	20	25
10	25	30
8	35	50

Rice for Stock Feed

The attention of stock feeders is drawn by Harry Hayward, formerly Dean and Director of the Delaware Agricultural College, to the value of rice in the farm ration. He states that the United States is now producing about thirty million bushels of this crop and that the twenty-one million acres available for rice growing could be made to produce about seven hundred million bushels. He indicates that the six million bushels of cull rough rice in the 1920 crop could very well be used in feeding farm animals.

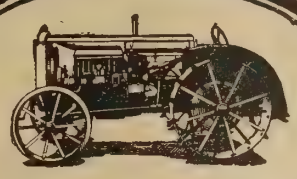
Rice is similar in composition to corn and should be fed with such nitrogenous roughages as the common legume hays or in a ration in which cottonseed meal, peanut meal, or other protein concentrates are used. It may supplement or replace corn in the ration for dairy cattle or in fattening cattle or hogs. Pound for pound, Mr. Hayward estimates that it is a better feed than corn, especially in the fattening of hogs.

He warns that since the rice kernel contains considerable oil, the product becomes rancid if kept very long after the kernel has been ground, especially in hot weather. It is necessary, therefore, to grind a small quantity at a time and feed it when freshly ground.



County Supervisors Aid in Improving Cattle

The work which a county board of supervisors can do in promoting the use of better cattle in a community is reported by Thomas G. Roberts, herdsman at the Ontonagon County Farm in the upper peninsula of Michigan. He states that the supervisors decided about ten years ago to purchase pure-bred Holstein cattle for the Ontonagon County Farm. Their object was to breed stock which could be disposed of to dairymen in the county at prices which would enable them to purchase first class pure-breds. As a result of their purchases, a herd has been built up from which farmers have bought many good bulls, doing away with the use of scrubs. Eight head of females were purchased at the beginning. During the last three years a grandson of Colantha 4th's Johanna has been used. His daughters are so promising that the institution will conduct official tests on them next year.



Mr. Roberts states that clover is grown very successfully in the county, as well as small grains. He believes that alfalfa will soon be grown extensively. He says that markets are becoming good since there are large markets nearby and since lake transportation enables dairy farmers to ship their products cheaply.

Allis-Chalmers 18-30

3-4 Plow—3000 lbs. Constant Draw Bar Pull

Speed!

Watch for the A-C 12-20!

EVERY feature of the A-C 18-30 is found also in the new A-C 12-20 2-3 plow tractor. Like its larger partner, the 12-20 is remarkably accessible. In 15 minutes clutch shoes can be taken out for re-lining; removal of two large side inspection plates exposes entire crankcase. Large-scale production makes this tractor, like the 18-30, one of the greatest values ever offered.

How You Profit by Seven Years' Perfecting

SEEDING time coming—discing and harrowing to be done—and soil must not be robbed of precious moisture content! These are the days when the Allis-Chalmers owner takes advantage of the weather; picks the choice time when the ground is *right*; and thus makes sure of bigger, better crops.

Speedy power, that does in hours what once took days; *conquering power*, which quickly masters sudden overloads—this is just the service Allis-Chalmers tractors guarantee. So the Allis-Chalmers owner faces each Spring's rush with calmness. He knows his tractor is a faithful, certain servant—that does his work on time and at the lowest cost.

Engineering Ideal Guided $42,500,000 Company

Seven years ago the $42,500,000 Allis-Chalmers Company—with over a half-century's experience in building only the highest quality machinery—started work on a super-tractor. And from the very first, Allis-Chalmers engineers championed one fundamental ideal: resist the strains of heavy farm duty and thereby lengthen tractor life.

Naturally, quality and advanced design—not bulk and weight—formed the basis upon which Allis-Chalmers sought for durability. Motors, transmissions, final drives of all types were tested, proved and improved—built and rebuilt time and time again. At last, a completed A-C 18-30 took the field. Performance surpassed expectations—but still was production delayed!

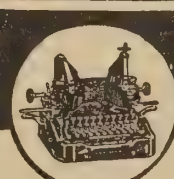
Finally, A-C 18-30's, in limited numbers, were released. Working in every kind of soil, and often held at full rated horse power hour after hour, each 18-30 stood the severest punishments that could possibly be given a tractor. And not a single owner made complaint!

Seven years previous, Allis-Chalmers engineers had set out to minimize tractor strains in heavy-duty farm work. To prove that they succeeded, we welcome anyone asking an A-C 18-30 owner for the facts about the service he is getting. Now, after seven years' development—climaxing the expenditure of $3,000,000—one of the world's largest manufacturing organizations goes into volume production!

WRITE FOR BOOKLET TODAY: Ask for the 18-30 or the 12-20 booklet—or both—giving complete details of exclusive Allis-Chalmers construction features which make these tractors so superior.

DEALERS: Write today for attractive dealership and jobber proposition. Share in the mammoth sales co-operation program which goes with Allis-Chalmers 100-tractor-a-day production capacity.

ALLIS-CHALMERS MFG. CO., DEPT. 28G Milwaukee, Wis.



Discs and Harrows 30 Acres in a 10-Hour Day

UNDER ordinary soil conditions the Allis-Chalmers 18-30 handles a 10-foot double disc and a 11-foot harrow (or culti-packer). Working at a speed close to three miles per hour—with tremendous reserve power always at your command—consider how rapidly and thoroughly every other operation in the preparation of a "mellow" seed bed can be carried on!

For belt work, too, this tractor is most adaptable. Equipped with responsive automobile type of steering, it is easy to line-up to any machine. A 28"-30" separator or the largest size ensilage cutter (filling a 40-foot silo), come within its range of power. An automatic governor (Allis-Chalmers' own make) holds engine at a constant speed—varying the mixture according to the load.

National Farm Bureau Notes

Beginning on April 11, the Executive Committee of the American Farm Bureau Federation and representatives from the various state farm bureau federations will meet in Washington, D. C., to work out a definite legislative program to present before the coming session of Congress. President J. R. Howard regards the legislative measures to be considered by the Sixty-sixth Congress as of such vital import to the farmers of America that he believes it desirable for the committee of five to have the counsel and support not only of the entire executive committee of the American Farm Bureau Federation, but of as many other farm bureau representatives as possible. The conference will carefully consider policies of interest to organized agriculture, and also study ways and means of most effectively speaking the farmer's mind with respect to such policies. Each state farm bureau federation will be asked to send at least one representative to the Washington legislative conference.

Tariff and Tax Measures

The Legislative Department of the American Farm Bureau Federation is giving attention to tariff revision and tax distribution, outstanding questions facing the special session of Congress early in April. No one yet seems able to predict with assurance whether there will be a temporary tariff followed by a general revision of all schedules, or no emergency action pending the full consideration of the entire problem.

The Washington office warns farmers that widespread influence and publicity are being used to bring about the abandonment of the excess profits tax and surtaxes as soon as possible after Congress convenes.

Reorganization of departments along many lines is being discussed by government officials. Some of them have suggested that the Department of Commerce take over from the Department of Agriculture the Bureau of Public Roads and the Bureau of Markets. The farmer naturally feels that his interests are considered paramount in the Department of Agriculture, and he will not favor such a change unless vital reasons for it are advanced.

Ohio to the Fore

Ohio steps into the lead of all the states with paid-up Farm Bureau membership for 1921. Treasurer Harry G. Beale of the Ohio Farm Bureau Federation reports that 62 county membership drives have been completed. The paid-up membership in the Buckeye State is 63,513.

Helps Utah Beet Growers

From Salt Lake City comes word that the sugar beet committee of the Utah State Farm Bureau saved $2,600,000 for the growers in negotiating a $15,600,000 contract for the 1921 crop.

At the beet growers' conference, held under the auspices of the American Farm Bureau Federation in Chicago on Jan. 17-18, a nationally uniform contract was recommended in which the price per net ton of beets is based on the year. The differential ranges about $6.45 per ton for beets when sugar is 5 cents per pound to $19.35 per ton for beets when sugar is 15 cents per pound.

Courses in Co-operative Marketing

The long look ahead has convinced officials of the American Farm Bureau Federation that one of the chief difficulties to be met in the co-operative marketing of farm crops will be the lack of trained men to man the marketing machinery efficiently. Accordingly, President J. R. Howard has written to the presidents of the various state universities and agricultural colleges and suggested that their institutions would render a great and appreciated service to agriculture by establishing courses in co-operative marketing. The need of young men trained in the mechanics of co-operative marketing is so urgent that it is to be hoped that both short and long courses in this subject will be forthwith provided.

Testing Clover Seed

HOARD'S DAIRYMAN:—I am not going to say or guess how many farmers have been disappointed by poor stands of clover which may have been due to sowing seed of low vitality or poor germination, but if it pays so well to test seed corn why should it not be as necessary to test our clover seed before sowing.

The viability of clover seeds is often lowered by the method of handling and storage, so it is a good idea to check up on the test given by the dealer in order to be sure. Seed that we thresh ourselves is invariably strong and we can keep it so for two years or more in dry storage, but it will be well to check up on it before sowing it.

A good stand of clover makes us happy and lends a feeling of security. A poor stand brings a lot of regrets for the whole year, for we must either reseed or break the course of our rotation. If our system of management calls for eight pounds of clover seed of high test and we sow seed that germinates only 80%, we shall get 80% of the desired stand of clover, other conditions being favorable. In order to secure a full stand with 80% seed we must use ten pounds of seed. That is worth thinking about and helps to establish an excellent reason for testing; it is like buying barn and grain insurance.

The best method I have found for testing is the rag doll, as used for corn. It is simpler and more reliable, I think, than the use of blotting paper, if one precaution is taken. I take a piece of muslin about two feet long and five or six inches wide to test three or four samples of seed. Two hundred seeds are usually sufficient to get a good test.

Spread the seeds out in the middle of the rag not closer than six or eight inches from the end that you begin to roll. Precaution: if the seeds are placed right at the end where you begin to roll the cloth they will not germinate so well because it seems that they are drowned or smothered by the water and cloth. Placing seed in that way I have gotten only fifty to seventy per cent germination when in reality the seed tested 100%. Fold in the sides of the cloth and roll the cloth loosely. I put this rag doll into an ordinary glass tumbler and add just enough water to thoroughly dampen the doll, then keep it on a shelf, uncovered, for four to seven days.

About the third day I usually get anxious to look in and see what proportion of seed germinates quickly and vigorously; it is a good thing to know. I like to see sprouts a half inch long in four or five days when the seed is kept in a moderate temperature; it shows that the seed is first class if the most of it is sprouted in that time, though many good seeds, especially if they are not scarified, will sprout several days later.

If the first test is disappointing and the seed does not germinate well it is a good idea to retest. One lot of seed I tested last winter gave about 75% test, and I began to believe that we had bought a poor lot of seed, but later tests showed it to be near 98% with quick, strong germination. If a bag of seed comes with a tag showing 98%, it should and is pretty likely to give that test under favorable conditions. It doesn't take long to make a test from each bag by the rag doll method and it is really a lot more interesting and instructive to the farm boys and girls than many believe who have not tried it.

Indiana. J. L. JUSTICE.

Ayrshire Breeders' Annual Meeting

To Be Held at Springfield, Mass.

At the meeting of the Board of Directors, it was decided to hold the annual meeting of the Ayrshire Breeders' Association in Springfield, Mass., Thursday, June 9, 1921, and that there would be a National Ayrshire Sale held the day following.

It was further voted that Messrs. A. H. Sagendorph of Spencer, Mass., as chairman, with Stephen Bull of Racine, Wis., George Stockwell of Boston, Mass., and R. L. Knight of Hope, R. I., be elected a sale committee for the 1921 National Ayrshire Sale, with authority to act.

Although an earlier decision had been made to hold the annual meeting of the association and sale this year in the Middle West, representatives of western breeders requested that these plans be changed and that the annual meeting be held in the East again this year. Springfield, Mass., was the choice and the annual meeting goes back for the third consecutive year. Ayrshire breeders will be at home in Springfield and it is hoped that there will be a large attendance.

CLYDE N. SMITH,
Secretary, *pro tem.*

Krumrey's Address to Cheese Producers

At the annual meeting of the stockholders of the Wisconsin Cheese Producers' Federation February 9, Henry Krumrey made the following statements in his address as president:

On January 1, 1921, this Federation had marketed the cheese for its members for six years and nine months. During that time it marketed 66,758,951 pounds. Of that amount, 28,080,838 pounds were handled during the last two years. This cheese sold for $15,824,157.56.

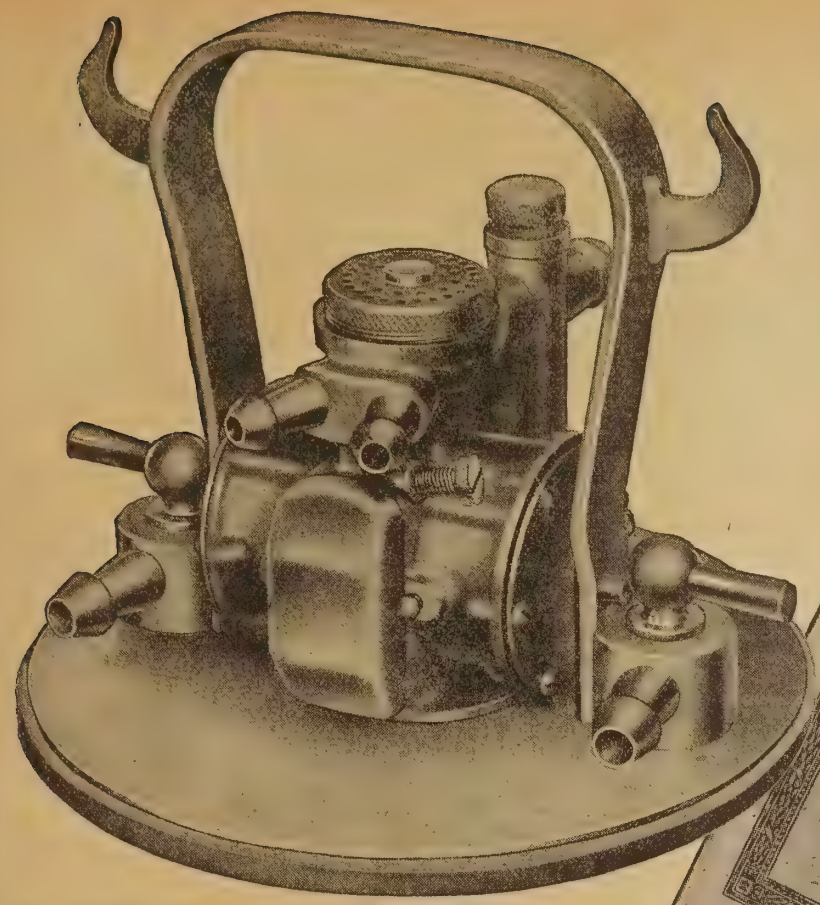
As shown by the investigation made last year by the Economics Department of the University of Wisconsin and the Division of Markets of Wisconsin the expense of marketing was extremely small. During these six years and nine months this cheese was sold to thousands of different concerns throughout forty states of the Union, and less than $2,700 was lost on poor accounts which were charged off, and of this amount a portion may yet be collected.

You have demonstrated that farmers can market their cheese co-operatively through an organization of this kind and do it cheaply and efficiently. During this time you have received as much per pound for your cheese as those factories not in the Federation, and over and above that you received in dividends or deferred payments, for the years 1917-1918 and 1919, $65,514.30 besides building, and paying for a warehouse and storage, which with grounds and equipment cost $61;547.05, and which could not now be replaced for a sum considerably larger than that. Furthermore, there is $23,877.15 remaining in your treasury.

All farm products suffered a great decline in price during the last year, cheese along with the rest. Very few concerns engaged in buying and selling of farm products during 1920 made any money, and many of them suffered big losses, and not even cheese dealers, I think, will be burdened with paying a heavy income tax on their 1920 earnings. The Federation was up against this same condition, as it was an unusual year.

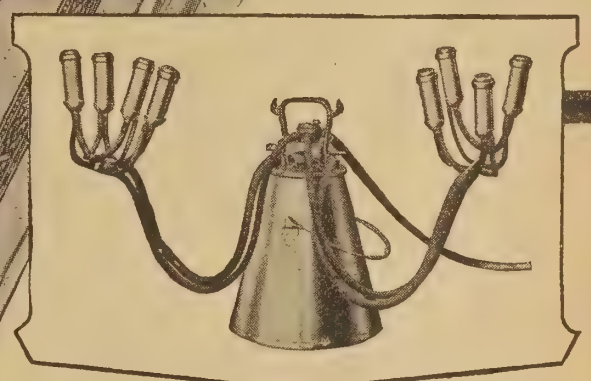
Longhorn cheese brought 33c on the board during January, 1920, and it was down to 20½c by November 1st of that year. I think that you are to be congratulated that your organization went through this period of price readjustment without suffering a heavy financial loss. Although we are only a few thousand dollars to the good we should be thankful for that. As a rule, no money can be made in handling farm products when the market is declining.

The great bulk of the cheese handled by the Federation consists of Longhorns, and it is significant that the board price on this style of cheese for a number of years now has been on the average considerably higher than the board price on Daisies and Twins, of which the Federation handles but few, and this in spite of the fact that it was worth at least ½c per pound more to manufacture Daisies than to manufacture Longhorns. It is also significant that the consumer throughout the country has paid fully as much per pound for Daisies and Twins as he has for Longhorns, although the producer sometimes got from 3 to 5c more per pound for Longhorns than he did for Daisies and Twins.



Calf Club Guernseys Make Good Records

HOARD'S DAIRYMAN:—The first six heifers owned by members of the Boone County Guernsey Calf Club of Indiana have completed their yearly records in production as a part of the calf club work with an average production of 346.2 pounds butterfat and an average of 7,256 pounds milk as two-year-olds. One of the heifers made 400 pounds butterfat and 8,285 pounds milk and four others of the first six produced over 300 pounds butterfat.



So far as is known, this is the first calf club in the United States to have completed a three-year calf club project and to have finished the records of production. Certainly this is a mighty fine showing for production when it is considered that these records were made under the feeding, care, and management of boys and girls of high school age or younger. Three of the six records are official Advanced Registry records conducted under the supervision of the American Guernsey Cattle Club.

These heifers were secured in July, 1918, by the members of the Boone County Calf Club from an importation of calves brought over from the Island of Guernsey. They have been entirely developed by the boys and girls and in addition to making good records of production they are excellent individuals, well grown, and of good showyard type. One of these heifers won third prize at the National Dairy Show at Chicago this year and as a yearling was junior champion at the Indiana State Fair.

Indiana. C. R. GEORGE.

Never Before—
An Absolute Guarantee
Against 4 Years' Ordinary Wear

HERE'S a guarantee on the new Empire Pulsator that covers not only materials and workmanship but 4 years' ordinary wear. That's insurance of the strongest kind. It means that with the Empire you buy not simply a machine but a *guaranteed period of milker service.* We not only stand squarely back of the machine, but of the principle on which this new pulsator works. We couldn't afford to make this guarantee unless we knew that the Empire Pulsator is as perfect in action and as durable as mechanical skill can make it.

A pulsator must be more than perfect in operation. It must be so strongly and simply built as to stand use over a period of years. A glance at the new Empire Pulsator will show you that this has been accomplished. Simple and self-contained, damage is practically impossible. Every mechanical principle employed has stood the two tests—perfect operation and durability.

The Empire Pulsator is sanitary to the last degree—no milk can get into the piston chamber—no dirt or oil can get into the milk. Two traps are provided which take care of this.

Uniform action is absolutely necessary in a pulsator. The Empire is so constructed that even with a change in vacuum within the operating range *there is no change in the speed of the pulsator.* Every stroke is positive, uniform and fully delivered.

Many dairymen who have been using Empires now for five years tell us that their machines are in just as good condition now as they were when installed. Pretty good evidence of Empire quality of material and construction this, but even more important they also report their cows in as good or better condition than before the machines were used.

You want to get every dollar possible out of your dairying. You want to reduce the labor to the lowest point possible. Then it is squarely up to you to write today for our catalog 1-M.

(Continued from page 447)

spective buyer may have had several cars of the quality he desired offered. Thus, the prices paid are entirely dependent upon demand and supply conditions. As to who wins in the trading is uncertain, of course, but it is a fact that the farmer or dealer who ships the best hay invariably receives the greatest returns. The dairyman or other user of hay who buys on order need only describe as accurately as possible the quality of hay he desires, and he can expect a purchase at as cheap a price as is within the power of the dealer.

The Cost of Selling

The shipper, or seller, pays for the plugging, the fee for which is 75 cents a car. There is another charge assessed against the shipper for weighing, which amounts to 75 cents a car. There is a commission charge of $1 a ton, or minimum of $10 a car, on hay, and 75 cents a ton, or $7.50 minimum per car, on straw. Also, there is a charge of 50 cents a car as watchman's fees, this protecting shippers against stealing from cars. These charges, aside from the commission, are taken by the Kansas City Hay Dealers' Association, but they are not in the form of profit, merely covering the actual expenses entailed by the organization for the various plugging, weighing, protecting, and other duties it performs. The shipper is served by a well directed organization, which pays salaries for only a single officer, the secretary, who is chief inspector, and at a minimum of expense.

A charge of 75 cents a ton is made for buying hay and straw on commission, with a minimum of $7.50 a car. However, the bulk of the hay sold at Kansas City is not obtained by consumers or distributing dealers on commission, but through net purchase prices agreed upon between the dealers and the buyers. A number of dealers specialize in making sales to consumers and their agents, quoting the consuming trade from day to day. Other dealers specialize in the handling of consignments for producers.

Pea Green Hay in Largest Demand

The demand on the Kansas City market shows clearly that the greatest and broadest outlet is for pea-green alfalfa, very leafy, not too woody nor too coarse. Comparatively large quantities of hay are received on the Kansas City market which either show cutting at the wrong date or improper curing. As a general rule, alfalfa hay with its greatest commercial value is cut, not according to the bloom, but according to the growth of the sprouts or the new growth of the plant. It is important that the alfalfa should be cut before the sprouts or the shoots attain such a height that would permit the sickles to include them in the cutting. The sprouts or shoots are the next crop, and often when cutting according to the bloom period the sprouts have reached such a growth as to force cutting along with the matured alfalfa. The result is, of course, fewer cuttings and less tonnage in the alfalfa crop.

Shipments of alfalfa and other hay are made from Kansas City to points in the New England States, Wisconsin, the Atlantic Coast, and the South and Middle West. While Montana and Wyoming are normally considered sources of supply, Kansas City has shipped hay to those states during periods of extremely cold weather and low local supplies of forage in that territory. During the European war Kansas City sent hay to France. Since the great advance in freight rates last August Kansas City, along with other markets, has suffered a sharp shrinkage in business, owing to the excessive cost of making shipments. For the first two months of this year Kansas City has received about 6,300 cars of all varieties of hay, compared with more than 13,000 cars in the same time in 1920.

Preparing for a Dairy Tariff

HOARD'S DAIRYMAN:—New England dairy farmers are taking the lead in securing accurate and dependable statistics for the use of the Ways and Means Committee of the incoming Congress when it begins to consider the question of a tariff. At the suggestion of the New England Milk Producers' Association the various farm organizations of this corner of the country have come together and appointed a joint committee to study the situation and to prepare such data as will be of use in framing a tariff on dairy products which will adequately protect the dairy interests of the country and of New England in particular.

They have good reason to be active in behalf of a tariff on dairy products. More than any other section of the country they are open to competition from Canadian milk and cream and from butter and other by-products from Denmark and other foreign lands where labor is cheaper and where living standards are decidedly lower. It is a matter of preservation of the dairy industry in New England with them and they hope that other sections of the country will take similar action in organizing committees, so that the right kind of data can be secured and presented in a way that will be convincing to those who will frame the new tariff.

In getting this New England committee under way the New England Milk Producers' Association, as the all-inclusive organization, took the lead. The association sent letters to the presidents of the farm bureau federations in every New England state, to the dairy departments of the state colleges, to the dairy divisions of the state departments of agriculture, the masters of state granges, and the presidents of the state dairymen's associations, asking each organization to send a representative to a conference in Boston for the discussion of the tariff situation.

It was the unanimous decision of the representatives of all these organizations that New England should take a prompt, decisive, and united action to make its tariff wants known so far as dairy products go. In order to get official backing from each organization it was decided to ask the various organizations in each state to choose an official representative from that state to serve on a permanent working committee. With these six men will be associated one representative of New York State, or that section of it which ships milk into Boston and whose interests are identical with New England's and one member representing the New England Milk Producers' Association.

It was the decision of this committee to immediately start on four distinct lines of work. The most important is to secure data on costs of production in Canada, especially that

portion of Canada which is immediately adjacent to New England and where considerable milk is already being shipped into New England. It is known that labor and feed costs are lower there, and that living conditions are on a less high standard than in New England, also that the conditions under which milk is being produced are under less supervision than in the states. But the committee will attempt to secure information as to the exact relation of costs of production on both sides of the line and of other differences in conditions under which milk is being produced.

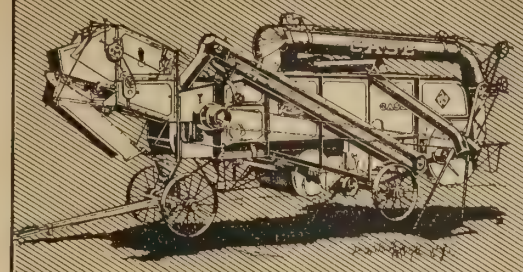
Another important piece of work which is being undertaken by the New England dairy tariff committee is to collect and correlate the information regarding costs of production already available in New England. The state colleges, cow test associations, and departments of agriculture have much valuable material of this nature. It was largely gathered on a state or county basis. It will now be assembled, correlated, and put in such form as to be available for effective use by the New England committee or by a national committee if one is organized. At present this data is of use only in the state in which it was secured. Properly brought together it will have a New England-wide and even a nation-wide significance.

A third project which the committee has undertaken is a study of the needs of protective tariff legislation as regards butter substitutes and the substances from which they are made. A special committee will take up this side of the question of securing definite and accurate information. The fourth project of the committee is to prepare an adequate presentation of the need of preserving and protecting the dairy industry in New England for the welfare of the consuming centers in the southern part of the New England States. Massachusetts, Rhode Island, and Connecticut now comprise the most densely populated area of the United States. More and more it is being recognized that the welfare of these cities and their people depends in large measure on a normal and healthy agriculture in the nearby territory. That means a prosperous and stable dairy industry.

The New England committee consists of M. D. Jones, farm management specialist of the Maine state college of agriculture; H. N. Sawyer of the New Hampshire Farm Bureau Federation; W. N. Cady of the Vermont State Grange; O. E. Camburn, head of the dairy division of the Massachusetts Department of Agriculture; Joseph G. Alsop, president of the Connecticut Dairymen's Association; Dr. George R. Little of New York, country physician and practical farmer; and Wesley H. Bronson, head of the statistical department of the New England Milk Producers' Association. It is looked upon as the strongest combination of dairy interests ever assembled in New England.

Massachusetts. HARRY L. PIPER.

Manitoba's Output of Dairy Products



The total value of dairy products produced in the Province of Manitoba during the year 1920 amounted to $15,939,846, according to the American consul at Winnipeg. More than 25,000 farmers in Manitoba are engaged in dairying and about 1,000 are milk shippers. During the year 17,209,083 lbs. of butter were sold of which amount 7,668,802 lbs. were creamery and 9,540,281 lbs. dairy butter. The average price received for creamery butter was 55c and for dairy butter 43c per pound. About 226,229 lbs. of cheese were sold at an average price of 27c per pound and 153,254,382 lbs. of milk, averaging 3.9c per pound.—Market Reporter.

Johne's Disease

Johne's disease, a strangely baffling disease very much like bovine tuberculosis in many of its symptoms, has been making a somewhat disconcerting spread in Wisconsin. The Wisconsin Experiment Station is investigating the disease and trying to perfect a method for detecting it with certainty. A vaccination material called Johnin, which corresponds to tuberculin in the testing of tuberculosis, is used.

Last year seven herds of dairy cattle were tested. Of these, 7 per cent, or 24 of the 325 animals tested, reacted. In post mortem examinations the tissues of 15 of the reacting animals were studied microscopically. Bacteria resembling the bacillus of this disease were found in 14 of the 15 cows. The Station is trying to develop a more simple method for microscopical discovery of the bacilli. It has been impossible to find the disease organism deeper than the submucous coat of the intestines. This is taken as evidence that the organisms are taken into the body through the mouth. It indicates that one means of preventing the spread of the disease in the herd is to see that the feed of the animals is not contaminated by manure.

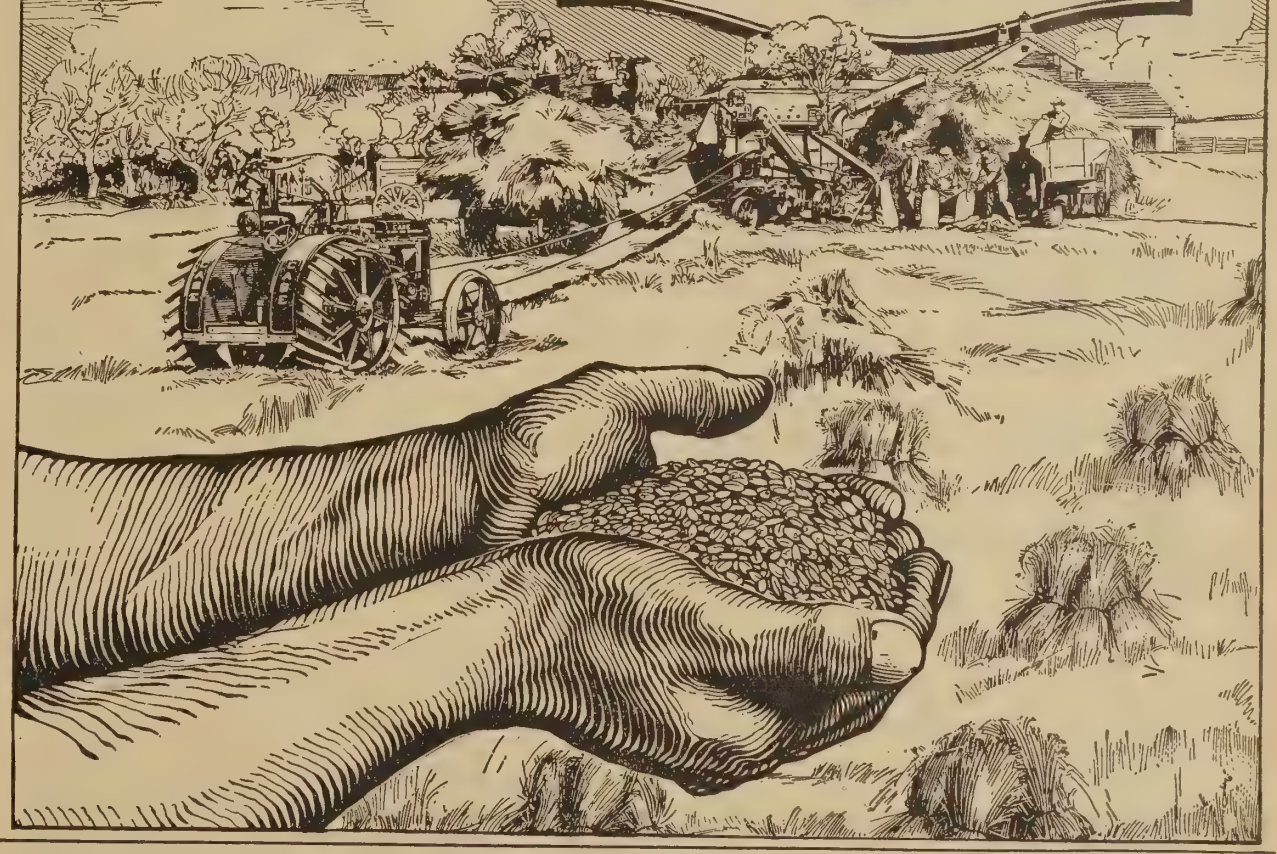
Coal ashes have mighty little fertilizing value; wood ashes have more than ten times as much. But coal ashes help to loosen a stiff clay soil.

Case steel-built, galvanized Threshers are made in the following sizes: 20x28, 22x36, 26x46, 28x50, 32x54, 36x58 and 40x62

Look for the EAGLE Our Trade Mark

Within Your Grasp

FROM the time the seed is planted until the threshed grain is stored safely in your granary or the local elevator, your crop *is within your grasp only once*—and that is when it is harvested and waiting to be threshed.



Winter killing (in some localities); a late Spring; a cold, wet Summer or a hot, dry one; soil blowing; weeds; rust; grasshoppers; chinch bugs; hail; windstorms—year after year such hazards menace your crop. Do what you will, you can only partially protect yourself against these dangers.

Then comes the final risk—threshing—*the one factor*, however, over which *you have control.* You need take no chances on having part of your hard-earned crop blown into the straw pile. Insist on *Case threshing.* Then you will be assured of clean threshing, complete separation, thorough cleaning, and unequalled saving of your grain.

If there is no Case Thresherman in your community or if another is needed, *become one yourself.*

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

Washington, March 21—The administration plan for congressional procedure in relation to precedence of tariff and revenue legislation has been decided on and the tariff gets precedence. This means that a tariff on butter and dairy products will be enacted by Congress very soon after April 11.

The outcome of this controversy indicates that agricultural problems have finally received the attention of the President and have been about the first problems to receive his attention after the place seekers had monopolized his attention for the first two weeks of his administration. In this interval every possible effort has been made by representatives of business organizations to force a consideration of the revenue laws as the first activity of Congress. Attacks of all kinds have been made on the present revenue laws, even to the extent of seeking material changes in the income tax law itself, and the impression has gained ground and credence that this effort would succeed, and the tariff would be postponed until late, perhaps to the December session.

This has seriously disturbed the representatives of agricultural interests who are agreed that a tariff is the first step toward bringing back some sort of reasonable expectation of the future to the farmers. That the tariff is not the only needed remedy is conceded, but it is a remedy, and one which is within the purview and possibilities of the new Congress, and at an early date if Congress and the administration so determines. So two weeks ago a drive of as big proportions as could be developed, was begun, directed at President Harding, to get—not a tariff—but an embargo. Concentrating under the leadership of Frank J. Hagenbarth, president of the National Association of Wool Growers, and the senators from the agricultural states, the agricultural interests made a demand for an embargo on wool, long staple cotton, vegetable oils, butter, hides, and lemons, with a demand that frozen meats be added if the President thought wise. The fight was put up to the administration so strongly that last week two cabinet sessions were held, and at the close the President is said to have been of the state of mind that he indicated that he would grant the demand and order the embargo unless he could be assured that Congress would take up the emergency tariff at once on convening.

This put the matter squarely up to the Ways and Means Committee of the House of Representatives, and today the announcement is made, seemingly official, that the program approved by the Ways and Means Committee, and also by leaders of the Senate is first the emergency tariff bill, just as it was enacted at the last session, except to run for six months only, instead of ten; second, an anti-dumping act; third, Americanized valuations as the basis of duties; fourth, permanent tariff revision; fifth, revenue legislation.

This program will meet agricultural approval. It has one question open to discussion and determination as to policy in so far as it relates to the dairy industry, and that is the question of whether to insist on the schedule of proposed emergency duties as passed by the Senate in the last session, that is eight cents a pound on butter, or as passed by the House, that is six cents a pound on butter. It is certain that producer interests are not protected at this time by the six-cent rate. On the other hand, commercial interests are satisfied with that rate. Just what the agreement means that the bill will be enacted "just as it was" in the last Congress is capable of two interpretations, and is subject to the decision of all the members of the House, not the committee alone. It needs prompt and careful consideration.

⚜

The election of Senator George W. Norris of Nebraska to be chairman of the Senate Committee on Agriculture is a matter of interest to all interested in agriculture. Senator Norris comes from a great agricultural state, one in which the dairy industry is growing, and where it has great possibilities. The candidate for the vacancy in this chairmanship, caused by the retirement of Senator Gronna, was Senator Page of Vermont. The final decision was to retain Senator Page as chairman of the committee on naval affairs, and promote Senator Norris, who stood next to Senator Page as senior members of the agricultural committee, to the chairmanship.

⚜

The March bulletin of the National Dairy Union just issued by the secretary, A. M. Loomis, contains the latest figures on oleo production for 1919 and 1920, as follows:

	Year ending December 31 1919	1920
Vegetable	142,698,848 lbs.	191,539,010 lbs.
Combined	224,061,770 lbs.	174,604,948 lbs.
Animal	4,556,569 lbs.	4,586,091 lbs.
Grand total	371,317,187 lbs.	370,730,049 lbs.

For the three months ending in January of this year the production of oleo was slightly in excess of 76 million pounds as compared with 110 million pounds in the corresponding period a year ago. For the calendar year ending Dec. 31, the amount of colored oleomargarine of all classes was 20,260,738 lbs. in 1919 and 14,537,807 lbs. in 1920.

It will be noted that there has been a considerable decline in all of the items for recent periods as compared with twelve months before and that the comparative falling off seems to be increasing. Just what part of this is due to a falling off in export trade cannot be told at this time as the export figures are not as yet readily available.

Dairy Herds for Mexico

HOARD'S DAIRYMAN:—Many high grade dairy cattle will be imported into Mexico from the United States during the next few months, according to Col. A. Garza Linares, who is establishing a large Jersey dairy at Monterey, Mexico. Colonel Linares has just purchased sixty head of registered Jersey cows from Ed. Lasater, who has a dairy herd of about 2,500 head of Jersey cattle upon his 300,000-acre ranch in Texas. Mr. Lasater's milking herd of Jerseys is said to be the largest in the United States.

Colonel Linares said that interest in dairying is being revived in all parts of Mexico. Many herds that were depleted during the long period of revolutions are to be restocked and the animals for this purpose will be brought from the United States. It also is planned to establish a large number of new dairies in the larger cities of the country.

Texas. W. D. HORNADAY.

Champion Jerseys Again on Test

Although she is more than 16 years old and has produced more butterfat in official work than any other cow, Sophie 19th is again on test for her tenth official record. In her first 125 days, she has made 5,137 lbs. milk containing 295 lbs. fat. It is estimated that she will this year be able to add enough to her previous records to make a total of 10,000 lbs. fat in her 10 yearly records. She is owned by C. I. Hood of Massachusetts.

Vive La France, who has brought much honor and fame to Pickard Bros. of Oregon, is now on her fifth official record at a little over 7 years of age. In her first 227 days she has made 8,000 lbs. milk containing 545 lbs. fat and at last reports was going at the rate of 2 lbs. of butterfat per day.

Seven years ago, Lucky Farce, as a yearling heifer, was the world's record cow for her age with a production of 14,260 lbs. milk containing 635 lbs. fat. As a mature cow she has made 938 lbs. fat and in 101 days of her present record has made 290 lbs. fat. She will soon be 10 years old and has been a great traveler. Her sixth and present owner is A. W. Murphy of Ohio.

New York State also comes into the limelight with Irene's Amelia, a nine-year-old cow on the farm of Mr. S. Hoxie Clark. Without any attempt at high production handling, she made 15,413 lbs. of milk containing 892 lbs. fat. She is a direct descendant of Jacoba Irene, a famous Jersey of former days that made 952 lbs. of fat. In the first 153 days of her present test, Irene's Amelia has produced 8,611 lbs. milk containing 445 lbs. fat.

Stockmen's Week in California

HOARD'S DAIRYMAN:—From February 22nd to 25th the live stock breeders of California enjoyed a program prepared especially for them at Davis. The service which the university offers to breeders of live stock was discussed. Legislation and prices, as usual, received keen attention during the daily conferences.

Judge J. M. Henderson, who is a leader in organizing dairymen in the state, presided on Dairymen's Day. On this day a survey of the official test work conducted in the state was presented and the California Dairy Cow Competition, which is now well under way, was explained. Dairy problems along the coast, the development of high producing herds, feeding, better sires, and prospects for the future were discussions that interested the dairymen.

Representatives of the manufacturers and Dairy Council told of the methods of meeting oleo competition. The lack of advertising among the united dairy interests was forcibly brought to the minds of those present. Of 20,000 dairymen in California, 1,500 advertise their product systematically.

A proposed dairy show for the Pacific Slope was outlined. Before the day was over the Jersey, Holstein, and Guernsey breeders held meetings.

California. J. C. MARQUARDT.

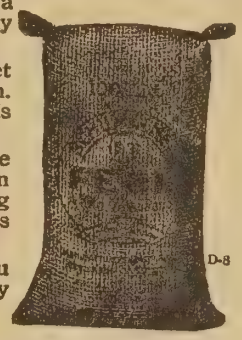
Prompt Action

"Jim's going to sue the company for damages."

"Why? What did they do to 'im?"

"They blew the quittin' whistle when he was carryin' a heavy piece of iron, and he dropped it on his foot."

Wisdom is the knowledge of knowing what to do next.—E. Markham.



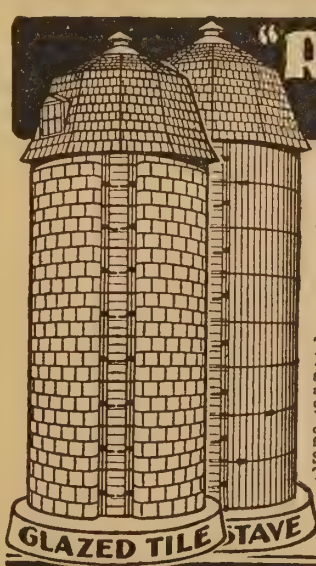
SCHUMACHER
PRICES ARE DOWN

DOWN go Schumacher Feed prices to pre-war basis—
DOWN to a level with the prices you get for the products you sell—
DOWN where Schumacher is a much cheaper feed than ground corn or oats, middlings or bran—
DOWN to a point where you cannot afford to miss the BIG SAVING today's prices give you on a feed that has

MORE food value than bran or middlings.
MORE food value than oats.
MORE food value than wheat feeds.
MORE food value than brewer's grains.

The Cheapest Feed to Feed

Therefore, don't let the fact that you have plenty of corn or oats keep you from buying Schumacher Feed at today's surprisingly low prices. Fed with gluten and cottonseed meal as your protein concentrates, it makes the **cheapest feed you can feed.** If you have a surplus of home-grown grain, it will pay you to sell some of it and buy Schumacher Feed. For instance:



Take the question of moisture. 95% of the corn inspected for market grading contains 19½% water—19½ lbs. of water in every 100 lbs. of corn. Better to sell water than to feed it, don't you think? Schumacher Feed is **kiln-dried.** It is **ALL** feed.

Now, take the question of digestibility. Schumacher contains 4% more digestible matter than oats; 6½% more than middlings; 12½% more than brewer's grains; 21% more than bran. It is made from the choicest feeding parts of Corn, Oats, Barley, Wheat, with Hominy, Wheat Flour, Middlings and Linseed Meal added, finely ground, scientifically blended.

Start Reducing Your Feed Costs Today by buying Schumacher and you will also start better results from your cows. If your dealer cannot supply you, write to us.

Infection

would have been prevented if B-K had been used shortly after this cow dropped that beautiful calf.

When cows do not clean properly after calving, it indicates a germ infection which is likely to run through the entire herd and result in Abortion and failure to "get with calf." The afterbirth should be removed at once, without force, and the cow flushed out with a powerful antiseptic.

B-K is scientifically correct for this work. It quickly dissolves the adhesions and slimy matter and brings the afterbirth, kills the germs and foul odors, stops the discharge and straining. B-K is non-poisonous, healing and soothing.

If your dealer does not have B-K send us his name. Get a gallon—the standard farm package.

FREE "trial offer" and bulletins on contagious abortion—calf scours—hog raising.

B-K—**in one bottle**—helps you keep all these diseases out of your herd—and prevents big cash losses.

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

The Making of Bruce Carter

[Continued]

Ellsworth Carter had barely finished his comment to Axtell Webb before his wife was at the foot of the stairs leading to Jimmy's room, calling for Bruce. Try as she might to retain her composure, it was plainly evident that she was fast losing her temper at what she considered willful disobedience on the part of Bruce. And hadn't she warned him during the day to play the part of a gentleman! And here he was into some mischief and again all dirtied up.

"Yes, mother," answered Bruce calmly. "I'm coming; we aren't going home yet, are we? Come on, Jimmy," he persuaded, "I guess it's goodbye with the Webb, Horne, & Carter Company now! Just look at my hands, grease and soot all over!"

"Hain't half as bad as your face," laughed Jimmy. "And the front of your shirt looks as though you had used it for a cleaning cloth," he added grimly. "But I'll go along and we'll make a clean breast of the whole affair, if worst comes to worst," he encouraged.

"Don't worry about it not coming to that," answered Bruce, his knees growing weaker at the thought of descending the stairs. "What will your dad say?" he asked Jimmy, trying to calm his rising fears.

"Oh, he'll just think that I've got an eye for business and laugh it off. He won't care! Why should he?" he asked innocently. "And I'm kind of glad that your folks found it out right now. It's going to make it easier for you, and I'll bet that your dad is going to take your part before we get through with this. You wait now and see! If you want me to do the explaining, I'll do it," he volunteered, "and between the two of us, we'll win this case," he added optimistically.

"You bad, bad boy," his mother scolded as she viewed her son at arms length, with every one looking on but without anything to say. "You aren't fit to be seen!"

"I'll get out of here then, if that's the case," Bruce whimpered and before she could say another word, Jimmy broke in with, "Don't blame Boo this time, Mrs. Carter. I'm his host to-night and I chose to entertain him the way I did. Let me explain and after that we'll leave it to every one here to pass judgment on us. We hain't done nothing wrong, and Boo has learned more to-night about some real things that boys like to know than he ever has done before. And I don't see why a fellow should be blamed for wanting to learn. Our teacher doesn't even do that, so why should anyone else!"

Jimmy knew that if he was to win the case he must work fast and take advantage of the silence which had settled over the situation. His mind was working hard and in his eyes there shone a light of victory that made them appear larger and bluer than ever. Mrs. Carter was too much overcome at this outburst of boyish bravado to even attempt to say anything further. She was silenced, for which Bruce was more than thankful.

"To-day there was a new firm organized in this neighborhood," he began, "the firm of Webb, Horne, & Carter Company. This company is going to launch into the chicken business and Boo and I were fitting up the old incubator in our attic. We want to get started this week and in order to do this we had to work to-night," he said as he looked in the direction of his father who was evidently enjoying the situation and the way his son was handling it. Bruce's father was shifting about uneasily in his chair, but there was the gleam of boyish interest in his eyes that Bruce was quick to detect. This lent him courage and as he started to speak he was silenced by his mother with, "not a word from you, young man. Jimmy, or James" she corrected, "will do the explaining."

To which Jimmy said, "I'm through. The case is before you and that's all we have to say. The company's organized and we start out this week."

Silence again followed until Mr. Carter was heard clearing his throat.

"Marie, this is nonsense. Bruce has done nothing that you wouldn't expect a real boy to do. I'm tired of correcting him so much just for the sake of making you feel that he is not growing away from you. In my opinion it's the very thing that will make him do so. I dislike to say these things in his presence and also in the presence of our hosts, but you are trying to train a boy into something for which he was never intended. For my part it is a welcome change to see our son all greased up like this. I'm tired of the starched kind of boy we've had about our home and I think it is about time for a change."

IN PLACE OF THE COVER WE'LL FIT WINDOWS

Bruce stood glued to his tracks. He never had heard anything like this before coming from his father and in fact he was beginning to believe that his dad was getting to be his natural enemy, so many had been his whippings of late. No, he never had expected anything like this, and when he had recovered from the first shock, he slyly winked at Jimmy as much as to say, "What is your fee for winning the case for me," but not one word did he utter. This was no time for him to attempt a defense now that he had two instead of one working for him. Bruce was too wise for that and, besides, his mother had warned that not another word was to come from him.

"For my part, I am tickled to death to see these boys out on a business venture of their own, and in fact believe that they should be encouraged for taking this action. If they learn about raising poultry in school, why in the name of common sense shouldn't they practice it when they have such a good chance as Jimmy is affording!" Then, turning directly to his wife, he added, "Marie, if you will leave Bruce's training with me from now on, I'll give you our word of honor, I mean his and mine, that we'll give a good account of ourselves whenever you wish to check us up."

He had fully recovered from his first angry outbreak and in fact he was now almost smiling persuasively to his better half. "What do you say?" he asked, as his wife wiped away the few tears that had arisen.

"I presume I have been rather set and foolish in my notions about Bruce. But who can blame me! He's been the one center for my attention since he was born and I did set my mind so on having him what I thought was a real gentleman," she sniffled.

"Well, isn't that what he is, a real gentleman? But in my opinion, Marie, starched boys aren't necessarily gentlemen. Clothes don't have anything to do with the matter. Now here's Jimmy, for instance. A better and more gentlemanly boy I wouldn't hope to see, but fine clothes never made him that way, and I for one am not willing to admit that Bruce is more of a gentleman than Jimmy. Fine clothes don't do the job."

Bruce was smiling now, quite audibly. He leaned over to Jimmy and whispered, "Score for you, Jimmy. You see dad's strong for you. Odds are all against mother now."

The strained silence which followed this speech was only broken when his wife, who now seemed completely composed, said, "I guess I was on the wrong track. The trouble was that I have had a very poor understanding of boys. Why shouldn't that be the case? I never had a brother of my own and I was brought up to believe only in fine clothes and a good time. But, Ellsworth, I don't want to give Bruce entirely over to you. That wouldn't be fair to either him or me. I'll tell you what we'll do. Let's go fifty-fifty-fifty. That means fifty for you and fifty for Bruce and fifty for me. That's fair to all of us and if I'm not mistaken that's the way Jimmy gets along," as she turned and gave him a winning smile, and as Jimmy afterward said it was the first Mrs. Carter had ever given him.

"Guess you and me might as well go back and finish our job, Jimmy," commented Bruce as he slapped him on the back so hard that he nearly lost his balance.

"Isn't a bad idea," Jimmy replied. "No use in spoiling another shirt, Boo, like you have this one." And back to the attic and incubator they dashed, without waiting for the finished details of the agreement which Bruce's parents were framing up regarding his welfare.

"Gosh you are lucky, old kid," were Jimmy's first words to Bruce as they seated themselves to complete their task. "Life's going to be some life for you from now on. Your dad's going to see that you get a square deal and you want to see that you play a fifty-fifty game yourself."

"Guess I am a lucky kid to get out of what I expected to be an impossibility," he returned while he rubbed the brightness back into the old brass bowl of the lamp. "Gee, though, I got a funny feeling 'round my heart when I heard dad open up and talk the way he did. It was so unexpected, and I'll just bet you a dollar, Jimmy, that dad has hated to give me all them lickings I had to take for the past two years." Here he paused as he stared into the darkness of the farther corner of the attic.

"Seeing ghosts, Boo?" Jimmy inquired as he stopped his work and looked at him.

"Naw, nothing like that, Jim. But I was just thinking that mother was right after all. How could she be blamed when she never had no dealings with boys, and I am the only one she has. I can see why she wanted me to always look nice and dressed up."

"Maybe that's so, Boo; I never stopped to think about that either. But gee," he laughed, "imagine Jen, my sister, not understanding boys if she ever has any. She thinks right now that she knows all my business and every other boy's in this neighborhood," he grinned. "But not much does she know me."

"Don't make fun of your sister, Jim, I kind of like her," Bruce replied.

"You go right on liking her," Jimmy returned, "but the farther she keeps her nose out of my business, the better I like it. You don't know, Boo, what a nuisance a sister can be if she wants to. You hain't had no experience and so you hain't no license to talk. They can make life miserable for a kid and I hain't been laying on no bed of roses either lately."

"Ah, don't come this sympathy stuff, Jim. You don't deserve it. You've been doing just about as you pleased all along while I had to toe the mark to the tune of dad's lickings. You don't know what misery is, you don't."

"All right, then I don't," Jimmy bit off, "but I wish you'd get through with that lamp. It won't burn any better with a polished bowl. Get busy and clean that egg tray. I can see very plainly that your education's been neglected." And without another word, Bruce set about following up the suggestion and in half an hour they considered the job complete.

"I guess she'll raise chicks for us now all right," commented Jimmy, as

the two stood back and reviewed the results of their evening's labors. "What do you say, Boo?"

"She ought to, Jim, but seeing I hain't had no experience, guess I hain't no license to speak," remembering the words of advice given by Jimmy a few moments previously. "Bill's going to be surprised when he knows what we did tonight, isn't he?" he added.

"Oh, I don't know about that," smiled Jimmy. "Bill's one of those fellows who'll let the other fellow do all the work if he can get away with it. You don't know him the way I do. But I don't want to set you agin Bill, he's a good fellow and we've had lots of fun together. We'll see that he does his share though. No work, no profits, will have to be our motto."

True to their plans, the incubator was set and running by Saturday. The company had agreed on starting out at Jimmy's home. Mr. Webb had donated a piece of land to be used for their plant, and the boys gladly accepted the same.

"I'm for building a new house," Bill had said when the boys were discussing their plans for housing the chicks.

"I can't agree with that," replied Jimmy. "I think that the plan suggested by Boo is a good one. If he furnish them," Bruce came back, "But if we can get them here, it will save lugging ours over."

"Tell you what I wish you would do, Bruce," Bill broke in. "Your dad's got some shingles left from building his machine shed. Could you furnish enough to shingle the house? Jimmy has given enough already and if you can give the shingles, I'll put them on. That's a good way to divide up, isn't it?"

"Sure, that's fair," answered Bruce. "I'll do that; dad will give them all right and I think I can get enough material for the perches and dropping board too. We'll want a dropping board because we'll have to have all the space on the floor we can get."

"That's right," interrupted Jimmy, "we'll need all the floor space and that's the way to get it. We'll make a go of it all right, " he added with enthusiasm. "We're getting along famously. And while you are working on the house, Bill, Bruce and I will figure out some kind of a brooder. I've got some ideas on that since talking it over with dad last night."

"Good," came from Bill at this suggestion. "I was wondering what we would do about that, and I couldn't figure but that's where our first real expense would come in. I'm glad you've been thinking about that

PRACTICING FOR THE DEMONSTRATION

can get their piano box, I am sure that dad will let us have this one, and by knocking the back side out of each, we can fit them together and make a pretty respectable place. Then if we cover all the sides with heavy paper and shingle it all over, I don't know what better we want to start out with. That will make a mighty warm place. We've simply got to economize until we get onto our feet. I've often heard dad say that it is better to start small and grow big than to attempt to start big and then fall flat. This proposition has got to pay for itself from the very beginning and it is only by doing so that we will keep up our interest. What do you say, Boo?"

"Them's my thoughts exactly, Jimmy, but you didn't say anything about the windows. We must allow for plenty of lights. You know how our teacher talks about that, so it must be pretty important."

"Oh, that won't be a difficult matter," said Jimmy. "We'll just face one of the cover sides toward the south and then in place of the cover, we'll fit windows. I think that will be enough for a house of this size. Yes, and by gum, I know what we'll do for windows too. There's an old sash of window panes in our wood shed. We'll just take those. They'll do as well as new ones."

"I was going to say that I could too, Jim. What are your plans?"

"Well, I wouldn't say that they are exactly mine," Jimmy started. "We'll have to give dad credit for the real idea back of it all, and I am sure that it will work because dad says it will," he spoke enthusiastically and confidentially. "You know that little old stove that we used to use out in our repair shop! You both have seen it hundreds of time. Dad says that we can have that and it will be just the thing for furnishing the heat. Then he is having a big tin reflector to put over the stove so as to throw the heat downward," and he began drawing it out with a stick on the bare ground. "You see the chicks can gather about the stove and they will regulate the amount of heat they want by moving toward or away from the stove. And, besides, dad says that he will have the tinner cut a ventilator in one side that we can leave open so as to control the heat somewhat too. So there you are, fellows! We haven't spent a cent yet and even if we do have to make the brooder ourselves, it won't cost us very much."

"And I have another idea," broke in Bruce as Jimmy concluded, while the other two turned to meet his interested face. "Dad and mother were talking with me last evening about our plans and mother made a mighty good suggestion. After we get things to going the way we want them, she wants us to give a demonstration of our work to the other boys and girls some Saturday. She thinks that will give us some advertising and help spread the idea of junior clubs among the rest of the young people. We could do it, too, and I am sure that our agricultural teacher would be glad to help us work out the idea."

Bill stared at Jimmy and Jimmy at Bill, while Bruce waited for an answer. "Not so bad," came from Bill at last. "But we better see that we are successful before we plan anything like that. Don't you think so, Jim?"

"The scheme is a good one, Bruce, and I am not quite as pessimistic as Bill. We'll be successful all right and I'm in for the idea. But I want to suggest that we leave the details of the scheme for Boo to work out. He and his mother can do that and when the time comes for us to help, we'll pitch in, Boo. Go ahead with the idea, and it will be good to have your mother in on it. 'Twill make it easier for you if you have her support." And so it was agreed that at some future date a demonstration would be given of their work to the other boys and girls of the community.

Junior Letters

Hoard's Dairyman Juniors:—I am 14 years old and in first year high at school. I live on a 60-acre farm and we keep 15 cows and 4 horses.

My brother and I raised chickens and ducks. We raised 75 chickens and 35 ducks last year. I have seven rabbits.

I wish some of the juniors would write to me. My address is R. D. No. 1, Frankfort, New York. Raymond Smith.

Hoard's Dairyman Juniors:—I have been intending to write for a long time, but have been real busy since school started. I am 14 years old and am in the eighth grade at school.

I live on a 64-acre farm. We farm on a small scale as we only keep 5 cows, 1 heifer, and 3 work horses. We kept two nice Hampshire hogs. We have a dandy Collie dog, named Teddy. He's not much on tricks, but he knows what he is doing when he is after the cows. I have for pets three nice kittens. They eat out of the same pan with Teddy and they even wash his face and sleep right on him. They sure are good friends.

My sister and I raised a large patch of muskmelons and sweet corn. There is a good market for them here during the tourist season, but our crop was too late to sell.

I sure like the Jimmie Green and Bob Ramsay stories. I only wish they were printed oftener.

Will close now wishing the juniors all kinds of success.

Wisconsin. Leslie C. Perkins.

Hoard's Dairyman Juniors:—We quit hauling milk to the cheese factory on Dec. 23rd and have been separating our milk since then. We make enough butter for our own use to last us all of next year till about Xmas. We find it much cheaper this way than to buy the butter all year.

There have been several cases of smallpox around here. I was vaccinated last week.

I am still in partnership with my brother. We now have a grade heifer calf 6 months old. We sold our cow for beef because she was not fit to keep for another year. Cattle sold to the stockyards bring poor prices around here, from $.03 to $.04 per lb.

I am writing to some of the juniors now and surely find it very interesting.

We put in our new telephone two weeks ago and now have it on two different lines, which sure comes handy.

Wisconsin. Emma Naef.

Hoard's Dairyman Juniors:—I am thirteen years old and in the seventh grade. I go to the Essex Junior Senior High School at Essex Center, Vt. The name of the farm that I live on is Brown's River Farm of about 180 acres. We have also three large horses and one Shetland pony which is mine, ten Berkshire hogs, seventeen yearlings, ten small calves, three two-year-olds, twenty-one cows, and one bull. One of the yearlings is mine. Her name is Snowball and my pony's name is Honey Boy. We have forty-one hens and ten of them, which are White Wyandottes, are mine. We have one large calf pen and a cow stable where there can be thirty head tied up. It has a cement floor and hog pens have cement floors. We also have a horse barn, a very large hen house, and a tractor. In the cow stable we have drinking cups which are very useful, especially in cold weather.

If any of the juniors wish to write to me I would be very glad to answer their letters. My address is R. 1, Essex Center, Vt.

Doris M. Ransom.

The Great United Line of Farm Helpers

United Milker
Really Sucks Like a Calf

Pump-pulsator type of machine. Gives complete vacuum release on teat—the smooth, natural way.

"SEE-THRU" TEAT CUP—an exclusive feature. You know when all teats are milking. Simplest, most efficient made.

UNITED ENGINE
1 3-4 to 12 H. P.—Ideal for any farm work—wonderful value. Investigate it.

SEPARATOR

Young man or boy for general farm work. Must be good milker. JAS. W. DRAKE, Route 1, Box 55, Lake Geneva, Wisconsin.

Success in a Montana Creamery

Profitable Returns Made Possible by Handling Only High Quality Raw Material

HOARD'S DAIRYMAN:—A farmers' co-operative creamery at Stevensville, Montana, is singularly successful, according to the observations of a representative of the Dairy Division, United States Department of Agriculture, who recently visited the plant. Other than producing 3,000 pounds of butter daily, the organization manufactures ice cream and artificial ice and collects eggs. The top-notch market price is commanded for butterfat and at the end of 1920 a dividend of from 5 to 10 cents a pound of fat was distributed to the patrons.

The Bitter Root Creamery, the name of the mutual farmers' organization, differs from most of the other creameries in the state in the methods of conducting business. Sour and off-flavored cream is discountenanced, the patrons being urged to observe practices that will insure a sweet product when delivered to the creamery. Obedience to this standard of procedure has paid handsomely in dividends. The egg-collecting venture likewise operates under a water-tight contract, only strictly fresh eggs being permissible for marketing. According to specifications the eggs are gathered twice daily and delivered to the creamery. Failure to comply with the regulations, three violations by one patron, signifies expulsion from participation in the advantages of marketing eggs through the creamery. The ban is without extenuating conditions, being permanent.

The creamery retails artificial ice for 25 cents a hundred pounds, and markets in ton or wholesale quantities at a rate of 20 cents per hundred pounds. Other than the profits accruing from this sideline activity, an adequate supply of ice is available to the patrons for cooling of cream and other household uses. During the past summer a large cold storage building was erected and two refrigerating machines are in continuous operation at the creamery and storage plant. The marketing problem, an ever-present uninviting condition in many similar co-operative ventures, seems to be solved at Stevensville. It is the inferior product which suffers most.

A co-operative undertaking is frequently successful by reason of the wholesome influence of one or two men. The representative of the Dairy Division attributes the progress of the Bitter Root Creamery to the faculty of leadership demonstrated by its manager, J. H. Howe. He is vice-president of a local bank, an evidence of the confidence in which he is held in the community. Mr. Howe is the promoter of dairymen's meetings, when speakers from a distance are obtained to talk to the patrons about methods contributing to profitable dairying. "It is undoubtedly owing to his efforts that a higher quality of raw material is received at the creamery than is the case in most western creameries," concludes the representative of the Dairy Division. "And in looking over the factory it appeared to me that he was able to get more and better work done with fewer men than I have observed to be the case in most creameries for years. To secure the maximum efforts cheerfully from each fellow worker means good team work and indicates ability to handle men."

Washington, D. C. S. R. WINTERS.

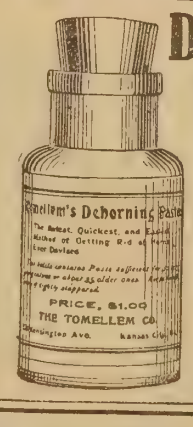
YOU can now build your new barn and silo at less cost with Denison Hollow Tile than with any other permanent building material.

DENISON HOLLOW BUILDING TILE

means construction that can't blow down, buckle, warp, twist or collapse—that is safe against fire and decay. It affords the best protection against summer heat and winter cold.



A FROST PROOF SILO. Besides the dead air spaces Denison Silo Tile has an advantage not found in any other make—the insulation pads which prevent freezing through the mortar joints.

TILE PRICES ARE DOWN—the supply is low—cars are available now. It's the best time to order. If you wait you may not be able to get any this year.

Write for full information. If you are planning to build see your lumber dealer at once. Denison Hollow Tile is sold by the best lumber dealers.

FOR SALE

Dairy farm. 440 acres. 170 cleared, clay soil, fenced with woven wire. House 34x46. Main dairy barn 36x104. addition 36x38, addition 30x50. Lighting and water system. Two tile silos, three set buildings; five horses; fifty-two head of cattle, fourteen of which are pure-bred, tractor, and all modern machinery. School on place. Income for 1920 $10,177.00.

Price $65,000—$25.000 Cash.

Two Miles from Good Town.

160 acres, 75 acres cleared, clay soil, four miles from town. Basement barn 36x90; modern house and other buildings. Forty-one head of cattle; two horses, lighting and water system. All modern machinery. Three-quarter mile from school.

Price $30,000—$15,000 Cash.

80 acres, 40 acres cleared; barn 36x70; 18 head of cattle, horses and all farm machinery. Three miles from town. One mile from school.

Price $12.000—$5.000 Cash.

80 acres, 45 acres cleared, clay soil. House 18x24. Two miles from good town. A bargain.

Price $8,000—$4,000 Cash.

80 acres sandy loam, 60 acres cleared. Two miles from town. Good house and barn. Two horses and five cows and farm machinery.

Price $5,000—$2.500 Cash.

40 acres clay soil. five miles from town, new house. Ten acres cleared.

$2,600—$1,200 Cash.

20 acres sandy loam. Good house and barn. Six acres cleared. Four miles from town.

Price $1,600—$800 Cash.

Immediate possession will be given of any of above farms.

The Secret of Making Your Dairy Pay

Help Your Cows Increase Your Profits

EVERY dairyman knows he can't make a profit on milk unless he *feeds* for it.

And unless he weighs his feed and weighs the milk from each cow he can't know the profit he makes.

Buffalo Corn Gluten Feed will greatly increase your milk yield.

Buffalo Corn Gluten Feed contains concentrated corn protein in a highly digestible form. It is used by successful dairymen all over the country.

Get a supply of Buffalo Corn Gluten Feed. Mix three parts of Buffalo Corn Gluten Feed with one part of wheat bran, or one part of ground oats and one part beet pulp.

You can mix a whole ton in a half hour—the most profitable half hour you ever spent.

Feed this mixture one pound to every three and one-half pounds of milk and see how your milk yield will jump.

After a month's trial of Buffalo Corn Gluten Feed you'll never again go back to the old methods of feeding.

FREE Write for full information giving the correct mixture for feeding Buffalo Corn Gluten Feed. If your dealer cannot supply you with Buffalo Corn Gluten Feed, tell us who and where he is. Write today to Corn Products Refining Company, Feed Department, 17 Battery Place, N. Y.

Sunflowers in North Dakota

HOARD'S DAIRYMAN:—Some of the farmers in Slope County, North Dakota, have been giving sunflowers a try-out with the following results: O. F. Pearl took two bushels of seed corn and one bushel of sunflower seed, mixed them together in a tub and planted them with a corn planter the same as if planting corn alone. After the mixture came up the gophers and cutworms took about one-third of the corn but did not touch the sunflowers at all. When the hot, dry weather came the corn dried up, but the sunflowers kept right on growing even if they did not make as big a growth as would be expected with more rainfall.

The mixture was handled just the same as corn and when put into the silo it was about two-thirds sunflowers and one-third corn. Mr. Pearl ends his letter by saying: "So you can see I am well pleased with sunflowers and as for the silage, I never had ensilage that the cattle liked as well as they do my mixture this year."

Alfred Moor says one of the things that surprised him is that it does not take over half the room in the silo for a ton of sunflowers as it does for a ton of corn. Mr. Moor put in corn first, figuring on topping out with sunflowers but as they took up less room than he planned on, he finished with corn. When making the change from one feed to the other he noticed no difference in the flow of milk and as he has quite a string of cows a little reduction in each one would make a very noticeable difference in the amount.

E. H. Olstad from over on the river country did not have a silo so he tried out the sunflowers as fodder. As he is just getting started in this country he did not get his sunflowers planted until the middle of June, besides some of his land is heavy gumbo which cannot be worked early in the spring. The sunflowers were planted in rows like corn with the seed five inches apart in the rows. The field ran up into some sand and when the dry weather came these were cut quite a bit by the drought but those in the gumbo came fine. By the first of September they were just beginning to bloom, with some blossoms about three inches across at which time they were cut with a corn binder and shocked up in shocks of from 1,000 to 2,000 pounds in a shock.

Mr. Olstad's original intention was to dig a pit silo to put them in but he did not find time to complete the silo so fed some of the fodder to see how the stock would take to it. He states that he has some good corn fodder and some oat hay, but his cattle will eat the sunflowers first if given a choice and do not leave a bit. He intends to increase his acreage next year as he considers sunflowers a good crop as well as a sure crop.

Other farmers who have seen these results the past year are planning on planting sunflowers the coming season.

CHAS. EASTGATE,
North Dakota. County Agent.

What is Balance of Nutrients?

(Continued from page 448)

more protein and ash, in proportion to the other constituents, than will a ration for older cows, as protein and ash are the constituents especially demanded for the purposes of growth.

Size

The influence of the size of the cow on the nutritive ratio required in her ration is rather a complicated one. Large cows consume less feed and produce less milk and butterfat per 100 lbs. live weight than do small cows of the same breed, though the large cows produce more milk and butterfat per 100 lbs. of feed consumed. As the small cow produces more milk per 100 lbs. live weight her maintenance requirements constitute a relatively smaller portion of her total feed requirements than is the case with the large cow. Consequently, the small cow, other things being equal, will require a narrower nutritive ratio than will the large cow, as relatively less protein is needed in the maintenance part of the ration than is required in that part of the ration used for productive purposes.

Condition

The condition of an animal has an influence on the amount of nutrients required per 1,000 lbs. live weight for maintenance.

Animals which are in high condition should be fed a narrow ration in order that the further production of body fat may be prevented as far as possible as excessive condition is not conducive to maximum milk production and the cow in low condition should be fed an abundance of fats and carbohydrates to bring her into good condition. Consequently, other things being equal, a cow will require a ration of narrower nutritive ratio when she is in high condition than is necessary when she is in sub-normal condition.

Yield of Milk

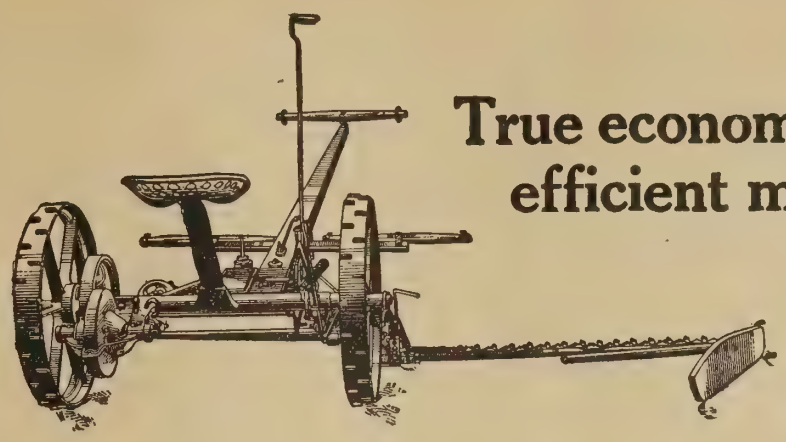
The law of diminishing returns applies to the production of milk as it does to practically every other form of production and so, after a certain point is reached, the greater the milk production the greater will be the amount of nutrients required for the production of each pound of milk; for example, 40 lbs. of milk per day with some cows may require more than twice as much nutrient material above the amount required for maintenance for its production as will 20 lbs. per day. It is very probable also that a further increase in milk production with such a cow will call for more than a proportional increase in the amount of protein as increased activity of the secretory cells of the udder will call for more material for the replacement of worn-out tissue and, consequently, the higher the milk production of a cow is the narrower will be the nutritive ratio required in the ration.

Quality of Milk

The richer the milk the greater will be the amount of nutrients required for the production of each pound. The protein content of milk does not increase as rapidly as does the fat content, that is, more milk protein per pound of fat is produced in poor milk than in rich milk. From this it is evident that on the whole the protein requirements for milk production will very probably increase less rapidly than the energy requirements as the milk becomes richer. Very probably a narrower nutritive ratio is required in the ration when poor milk is being produced than when rich milk is being secreted. This is in accord with the teachings of modern feeding standards.

Stage of Lactation

As lactation advances more feed will be required to produce 100 lbs. of milk than was required in the earlier stages of lactation—this refers to the whole ration, for both maintenance and production. As the amount of milk produced per 100 lbs. live weight decreases with the advance in lactation the total amount of feed eaten per 100 lbs. of milk produced must increase. It is very probable that the exact requirements for production increase with advance in lactation period, due to the fact that the impetus to milk secretion is decreasing.



In the later stages of lactation the cow is usually pregnant, and though work at the Missouri Station has shown that very little feed is required for the growth of the foetus it is very probably best to provide for the cow at this stage a ration with a good supply of protein and ash. At the same time, however, it will be necessary to build up the body reserves of the animal and the desired increase in weight can usually be obtained by the liberal use of carbohydrates and fats and, consequently, the ration at this stage will have a wider nutritive ratio than that used earlier in the period.

Individuality of the Cow

Individual cows vary not only in the total amounts of nutrients, but also in the relative proportions of the various nutrients which they require for the purposes of maintenance and production. Cows of the same weight and producing equal quantities of milk of the same quality will vary in their requirements and such variations are due to the "individuality" of the animals.

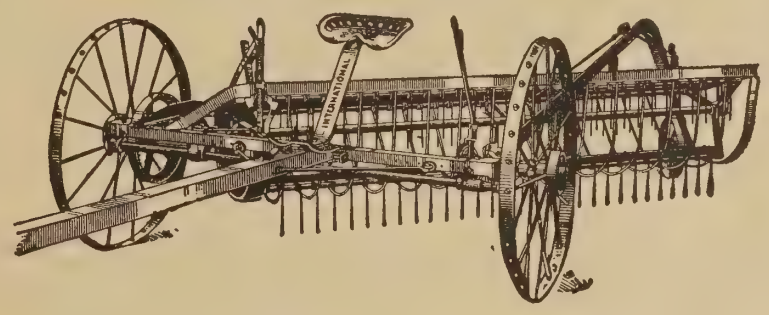
That old adage about a woman's work being never done seems to be backed up by figures. A government report indicates that farm women work thirteen hours a day in summer and ten and a half hours in winter.

Uncle Ab says: Your words come back to you; better make 'em kind words.

True economy calls for efficient machines

International hay machines cut operating costs

WAS there ever a time when to get maximum production with the smallest possible expense was so necessary as now? How are you going to do it? Probably your biggest problem is labor. Labor is hard to get, and expensive when you get it—too expensive to use at keeping worn-out equipment on the job. Efficient machines are cheapest. International hay machines are efficient—their long, unbroken record of dependable field service proves their worth.



Therefore you make a true investment when you buy International hay machines. They save labor and time, both of which are especially valuable just now. While you are still busy with the hay, grain harvest is nearly always at your heels. You wonder how you are going to get your hay out of the way. Do it with efficient machines.

You know your own problems better than anyone else, but, whatever they are, there are machines in the International Harvester line that will put your hay where you want it, the way you want it, in the quickest, most economical way.

A postal request will bring you the International hay machine catalog. It tells all about McCormick and Deering mowers and rakes, International tedders, combined side delivery rakes and tedders, loaders, sweep rakes, stackers and hay presses.

Write for catalog, and see your International Dealer

DAIRY MARKET NEWS

New York Butter Market

NEW YORK CITY, MARCH 22:—Butter receivers, who favor an increase in duty on imported butter, are quite elated over the report from Washington, which was published yesterday, that the Ways and Means Committee of the House and the Finance Committee of the Senate, acting with the approval of the President, had decided to re-enact the Fordney Emergency Tariff Bill, which was passed by the late Congress but which failed to be ratified by President Wilson. Aside from amending the bill to make it operative for six months, instead of ten, it is probable that no further changes in it will be made. That would assure a 6c duty on imported butter, instead of 2½c which now obtains under the provisions of the Underwood Tariff bill. While the bill, if it does become a law, would naturally tend to limit the importation of foreign butter under normal conditions, there are many who feel that it would have but little effect on the quantity of Danish butter that would be imported. Their reasoning is as follows: Danish exchange has a comparatively low value at present. When the American money received for the Danish butter is converted into Danish kroners, the Danes receive a premium for their butter over what the face value of the American money would indicate. Therefore, an additional tariff of 3½c per pound would not be prohibitive. The law will have to become operative before we can decide whether or not it will be of any benefit to the dairyman.

Approximately 16,000 casks of Danish butter were received at this port last week. A high percentage of it had been sold by the original buyers while it was in transit, hence those to whom it belonged upon arrival found, after paying the profit to the original buyers, that it would not bring a price equal to that paid for it. In order to avoid losses on the declining market, the holders placed much of it away in storage to await price advances. Because of that, prices did not slump so much when the butter became available as operators anticipated. In fact, as soon as the butter was placed in storage prices began to advance as the supply of domestic butter was insufficient to meet the demand. Some of the Danish butter is now being sold, but not in large enough quantities to cause a slump in the market.

The decline in butter prices which materialized last week over a period of several days, resulted in a lowering of retail prices to such a degree that buying by consumers was greatly stimulated. As a result, wholesalers found their stocks clearing as fast as they were received. The consequence was that the downward price trend was checked and an upward reaction ensued. However, it is very probable that the price advance will be checked very soon and that prices will again decline within the next two or three days. Domestic receipts show a marked tendency to increase, which will probably be greatly accelerated if the mild weather, which now prevails, continues. With a large quantity of Danish butter available and with domestic receipts increasing there is bound to be price declines.

From Monday until Thursday of last week, there was a bearish feeling in the market and prices declined three cents during that time. On Friday, the decline was checked by the active demand and the scarcity of high quality domestic supplies. There was no change in quotation, however. A variable market must be expected for the next several weeks and the price trend will be, on the whole, constantly downward. Established quotations today are: Extras (92 score), 46@46¼c; higher scoring than extras (93 score or higher), 46½@47¼c; firsts (90—91 score), 44½@45½c; firsts (88—89 score), 42½@44c; and, seconds (83—87 score), 37@41½c. Danish butter is moving irregularly at 45@46c.

W. B. LIVERANCE.

Butter Prices Decline Sharply

[Report by U. S. Bureau of Markets.]

The week ending March 19 was the second consecutive week that domestic butter markets have been under severe pressure and have declined sharply as a result of Danish competition. The previous week it was anticipation, and this week it was realization. In other words, prices were at first lowered to discount an expected drop in the market when the Danish arrived and later they declined as a result of the actual competition from arrivals of the butter.

Of course, the actual competition was confined largely to New York where the butter arrived, but weakness at New York means dull trading at Chicago, Boston, Philadelphia, and a sentimental depression all over the country.

Domestic receipts, while showing a slight increase, have not been excessive and consumptive trade has continued good but buyers simply will not deal on a declining market beyond the point of actual necessity. A bad break in egg prices, a weak butter market on the Pacific Coast with contributing shipments of New Zealand and fresh California butter did little to help matters. The reported difficulties of egg dealers in securing adequate marginal loans from banks and storages for storing purposes, has led many to believe that a large b[illegible]

ter production in June will mean low butter prices.

Due to resale while in transit on a good market much of the 16,000 or more casks which arrived at New York during the week on two steamers cost present holders up to 49c or 50c. While a much better tone was in evidence at the close of the week and stocks of domestic butter are short, particularly at New York and Chicago, it was not considered likely that prices would become enough higher to show a profit on this imported butter.

Centralized creameries show another good sized increase in the current output as compared with a year ago. There is also some talk of more butter from some of the smaller condenseries. Holders of storage stocks are still working hard to clear or use up their own goods, but open market sales are few and prices very irregular. The Bureau of Markets' cold storage report, as of March 1, showed holdings of 26,773,000 lbs. of butter compared with 22,568,000 lbs. on March 1st of last year. The February storage reduction was approximately 15,000,000 lbs. The January reduction was 17,000,000 lbs.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending March 19, 1921, and corresponding week last year were as follows:

	Week ending March 19 1921	1920
	cents	cents
New York	45.5	68.0
Chicago	45.0	67.4
Philadelphia	45.5	69.0
Boston	45.6	68.5
San Francisco	37.1	60.1

The receipts of butter at these markets were 7,777,231 lbs. as compared with 8,130,664 lbs. last year and 7,799,214 lbs. last week.

Cheese Markets Lose Advances

(Report of U. S. Bureau of Markets)

Trading for the most part was dull in cheese markets during the week ending March 19, and declines at country markets in Wisconsin on March 17 were followed by weakness and inactivity in practically all distributing centers. It is estimated that in some of the wholesale markets less than half as much business was transacted as during preceding weeks.

Several factors contributed to such a development. In the first place a good many of the distributing trade have felt that lower markets

Count AND Ormsby Blood
To those breeders who are using sons of Count or breeding Ormsby blood this young bull should be especially attractive.
Sire
Sir Ormsby Hengerveld Korndyke, son of Pietertje Maid Ormsby, 35.56 butter. His sire, Sir Korndyke Hengerveld De Kol, sire of 45 A. R. O. daughters, including Miss Korndyke Akkrummer Ormsby, 39.53 butter.
Dam
Eureka Melissa Segis 21 lbs. butter and is finishing up the year well over 750 pounds. Eureka was sired by a full brother—King Segis Pontiac Count, "the marvel of all sires", her dam Eureka Melissa 25.08 lbs. butter from Paul Beets Walker, sire of 44 A. R. O. daughters.
Send for Pedigree
Write and get this bull's pedigree and study the blood lines carefully. Better still come to the farm at Blooming Prairie and see him.
Act Now.

were in order, and consequently buying has been mostly for immediate needs, and trading has lacked the confidence which attends a good healthy market. Furthermore, advances which occurred during the past month resulted in prices of fresh cheese being brought nearer held cheese prices, and some buyers turned to held goods when they considered prices satisfactory.

This will account to a certain degree for the stronger condition of the held cheese market, but in this connection, it should also be remembered that stocks of held cheese are not extreme and that they have been fairly well picked over. Buyers who have a fancy demand to take care of later have been buying whenever opportunity offered in order to avoid a later shortage.

A further factor which has doubtless had some bearing on the situation is that regardless of the fact that the current supply of cheese in some cities is comparatively small, the attention of buyers is centered now on eggs and butter. Already eggs are going into storage, the early season having started this movement fully a month sooner than usual.

The average wholesale prices on American cheese (style Twins) for the week ending March 19, 1921, and for the corresponding week last year were as follows:

	Week ending March 19 1921	1920
	cents	cents
New York	27.7	29.5
Chicago	25.3	28.6
Boston	25.2	30.7
San Francisco	21.6	28.2
Wisconsin	25.1	28.4

The total receipts of American cheese at these markets were 2,533,940 lbs. as compared with 8,130,664 lbs. a year ago and 7,799,214 lbs. last week.

Wisconsin Live Stock Production

The total value of live stock production in Wisconsin in 1920 is estimated by Joseph A. Becker of the Wisconsin Co-operative Crop Reporting Service (U. S. Bureau of Crop Estimates and Wisconsin State Department of Agriculture), to have been $383,051,000, compared to $416,811,000 in 1919 and $125,025,000 in 1909. Value in 1920 was only 91.9% of the 1919 value, although the quantities produced were uniformly greater.

Milk made up 61.1% of the value of live stock production in 1920, compared to 60.1% in 1919. In 1920, 1,836,000 cows produced 91,451,000 hundredweight of milk (an average of 4,981 lbs. per cow) valued at $234,326,000 ($2.563 per cwt.); in 1919, 1,802,000 cows produced 88,870,000 hundredweight (an average of 4,933 lbs. per cow) valued at $251,003,000 ($2.824 per cwt.); and in 1909, 1,474,000 cows produced 57,073,000 hundredweight valued at $65,064,000. Prices of milk and dairy products were higher during the first half of 1920 than during the same period in 1919. During the second half year, milk prices declined, but to a lesser extent than did other farm products.

The number of cattle slaughtered in 1920 is estimated at 514,000, valued at farm at $30,583,000. This is a decrease from last year of three thousand in numbers and $3,539,000 in value. Calves slaughtered totaled 842,000, valued at $9,094,000. This was an increase over last year of nearly one hundred thousand in numbers, but the value decreased nearly three hundred thousand.

Sheep and lambs were slaughtered to the number of 364,000, valued at $3,385,000. This is a decrease of eighty thousand in numbers and over one million dollars in value.

Over two million swine were slaughtered, valued at $10,336,000. This is an increase of forty-seven thousand in numbers and twenty-three million dollars in value.

Nearly nine million head of poultry were slaughtered, valued at $10,336,000. It is estimated that hens laid 79,156,000 dozen eggs (an average of 85), valued at $34,037,000.

The wool clip is placed at 3,360,000 lbs., valued at $806,000.

Even honey is listed as a live stock product with 3,360,000 lbs., valued at $1,292,000.

The Oil of "Oversize" Service

HERE is a quart of motor oil that means more than a quart of lubricating service. Here is oil that is backed up by a "margin of safet"y to resist intense explosion heat, oil that does not wilt or run, oil that is not quickly diluted to uselessness by the drippings of unburned motor fuel that seep past your pistons.

This "oversize" service margin of

In the Wasteless Easy-Pouring Top Tip Can

Wadhams *Tempered* Motor Oil

If Tempered Oil and untempered oil could be dissected to show their real structure, you would get a comparison similar to the views above—one, unbroken, firmly knit, ready for its duty, the other shattered to the verge of breakdown — pre-crumbled by abusive uncontrolled heating in manufacture.

results from Wadhams tempering process of refining. Tempering insures an extra degree of sturdiness and hang-together. Tempering furnishes the super-endurance necessary to keep protecting oil films on cylinder walls despite intense explosion heat. Tempering enables oil to cope with the unburned motor fuel that drips past the pistons and dilutes ordinary oils to washy uselessness.

In every locality, dealers who most earnestly seek to give their customers maximum value, are selling Tempered oils. If your dealer does not carry them, ask him to get in touch with Wadhams. *Insist* on Wadhams Tempered Oils, for your tractor as well as your motor car.

Dairying Thirty Years Ago

Taken From the Issue of Hoard's Dairyman of April 3, 1891

There are some men whom we would no more advise to go into dairying than we would advise some other men to go to preaching. In the one case we have a tender regard for the cows; and in the other, for the hearers.

⚜

When a farmer says he has no time to read, he has advertised the fact that he has no taste for it; and, furthermore, he has advertised his practical contempt of the usefulness of acquiring knowledge through the experience of others—experience that he can get cheaper out of papers and books than he can experiment himself. So he is ever repeating the fallacies of others, or more like plodding along and learning no better methods very fast.

⚜

There has been marked progress in the last ten years along all the lines of animal husbandry. This is due very largely to the great increase of agitation in the minds of farmers through the work of dairy conventions, farm institutes, and the dairy and agricultural press. The mind of the average farmer has been stirred more on these questions in the last decade than in the previous forty years. Men are beginning to see that on the question of breeding and handling of cattle and the rearing of calves they must approach the subject absolutely from a physiological standpoint. If a strong, healthy calf is to be reared, the laws of nature must be studied just as thoroughly as is required in the rearing of children. We must always remember that it is not our business to originate these laws, but rather to find them out and learn how to skillfully make use of them.

⚜

Considerable is now being said about a new way of producing refrigeration. It is to manufacture artificial ice without the use of the ice-machine, so much in use. It is done by using what is called "Refrigerine Salts",—a combination of harmless mineral salts which, when mixed with water, makes a brine which almost instantly falls below 32 degrees—the freezing point. It also secures a very dry atmosphere. Capitalists are putting their money into it, confident that it is a good thing.

Dairy Markets

Hold to optimistic ideals and you will drive out pessimism, the great breeder of disease, failure, and misery. Stand guard at the door of your mind; keep out all the enemies of your happiness and achievements by continually flooding your mental kingdom with thoughts of love, good will, happiness, prosperity—whatever you desire to realize in your life—and you will be astonished at your increased power and happiness.—MARDEN.

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Milk Fever or Parturient Paresis

When a heavy milking cow that has had a calf or two and is in first class condition loses the power of her hind legs, goes down and becomes unconscious in 24 to 72 hours after calving easily and expelling her afterbirth, the disease is termed "milk fever". That name is a misnomer, however, for the temperature usually is considerably below the normal of 101.5 degrees Fahrenheit, and sometimes falls as low as 96 F. Gradual return of the temperature to normal during the process of treatment generally indicates speedy and certain recovery.

An attack is preceded by loss of appetite and restlessness. The cow steps up and down with her hind legs and may thrust out her tongue. Then she becomes "wabbly behind", falls, and after a period of sleepiness becomes unconscious, snores, and lies with her head tucked into her side. Her eyeballs are insensitive when rubbed with a finger. In extra severe cases the cow tends to lie upon her side, and if allowed to do so quickly bloats and may die from suffocation. That position and bloating also favor regurgitation of feed which may enter the windpipe and lungs and cause fatal mechanical pneumonia should the cow get up as the result of treatment. Before death the cow may become delirious, struggle, and dash her head upon the ground so that her horns become broken. Before a successful method of treatment was perfected attacks proved fatal in a majority of cases.

Immediate inflation of the udder with air pumped in through a sterilized milking tube by means of a small rubber tube and bulb syringe proves remedial in a majority of cases. The udder should first be milked clean, but usually contains little milk. The teats should then be disinfected thoroughly before inflation. Each quarter in turn should next be tightly distended with air and the tip of the teat then dented inward repeatedly until the air is retained. A tape or rubber band should on no account be used to cause retention of air. After inflation of the udder is completed, the veterinarian should give the cow a hypodermic dose of strychnin or atropin and have her body warmly covered with blankets. As soon as the cow becomes conscious, which usually occurs in a few hours, she should be assisted to rise and be supported while regaining strength. If she fails to rise in four or five hours the entire treatment must be repeated. It should also be applied in attacks of the disease which occasionally occur before calving.

The disease would become less common were pregnant cows housed in well ventilated stables, dried off six weeks or so before calving, then fed light, laxative rations and made to take daily exercise. The disease is practically unknown in range cows and generally attacks the pampered, heavily fed, ultra-domesticated cow. One attack predisposes to another. It is therefore of paramount importance to avoid the trouble by adopting the preventive measures suggested here.

Garget

I have a cow which had what I think is garget. Would it be all right to let the calf run with her? She is a well bred cow and I am working from grades to pure-breds, therefore would like to raise calves from her.

Morris, Ill. B. T. M.

If any quarter of the udder yields abnormal milk as a result of garget (mammitis) the milk is unfit for any use and the cow had better be "dried off" and fitted for the butcher.

Larkspur Poisoning

Please tell us what to do for a cow that is poisoned from eating larkspur.

Goldson, Ore. F. A. D.

Many remedies have been proposed, but the best results have been obtained from hypodermic injection of 1 grain of physostigmin salicylate, 2 grains of pilocarpin hydrochlorid, and ½ grain of strychnin sulphate dissolved in a little water. Full particulars on the subject will be found in Bulletin No. 365 of the U. S. Department of Agriculture, Washington, D. C.

Ringworm

My Holstein calves have become infected with a form of itch appearing in spots around the eyes and upon the body. It appears with loss of hair and the skin becomes scaly and scabby. It is worse on the calves that are mostly white with very little of the black marking.

Fowler, Ind. W. T. C.

Saturate the spots daily with sweet oil or cottonseed oil until the crusts can perfectly be removed by scrubbing with soap and hot water. When dry, then paint the spots twice daily with tincture of iodin and rub iodoform powder into those on the upper eyelids. Spots on the body are well treated, after cleansing, by saturating once a week with a solution of four ounces of sulphate of copper (bluestone) in a pint of hot water. As the disease is contagious, affected calves should be isolated and the place they have occupied should be cleansed, disinfected, and whitewashed.

Tests in Minnesota

M. H. Fohrman, in charge of official testing in Minnesota, reports that in January of 669 cows on test in that state 110 or 16.5% produced more than four pounds of butterfat in two days. This is a better showing than was made in any preceding month. Eighteen cows produced more than five pounds of butterfat in two days. A total of 915 tests were made. Of the yearly tests 67% were for Holsteins, 22% for Guernseys, and 7.6% for Jerseys. Of 197 seven-day tests completed in the month, 81 exceeded 16 pounds of butterfat.

A 1-Piece Cow Stall
ONE Attachment
THAT describes the CLAY Cow Stall. Easily and quickly put up—and *stays up*. Nothing to break. Warranted not to bend. For bigger dairy profits—through safety, sanitation and a saving of time, feed and labor—equip with the
CLAY SANITARY ONE-PIECE STALL
Strong Smooth Steel Tubing No Angles, Joints Or Heavy Castings
Simplest, strongest cow stall made. Outlasts the barn. Designed with the help of hundreds of dairy farmers who *know* what the dairy farmer needs. None of the faults of old-style stalls — all of the good points barn equipment can have.
CLAY Equipment will save you *hours* every week, keep your herd comfortable and contented and pay dividends from the start in a bigger yield of milk.
CLAY 2-Way 1-Hand Stanchion
Instantly closed or opened *both* ways with *one* hand. Eliminates troublesome sure-stops. Locks at 6½, 7½, or 8¼ inches—fits either cow or heifer without change. Hangs squarely in center of stall—cow can't miss it. Lock guaranteed brute-proof.
YOU CAN MAKE MORE MONEY
CLAY Guaranteed Equipment makes dairy-barn work quick, easy, pleasant. In hundreds of dairy barns it has quickly paid for itself and increased cow earnings. It will make money for you.

"You Save Money"
says the Good Judge
And get more genuine chewing satisfaction, when you use this class of tobacco.
This is because the full, rich, real tobacco taste lasts so long, you don't need a fresh chew nearly as often.
And a small chew gives more real satisfaction than a big chew of the ordinary kind ever did.
Any man who uses the Real Tobacco Chew will tell you that.
Put up in two styles

W-B CUT is a long fine-cut tobacco
RIGHT CUT is a short-cut tobacco
Weyman-Bruton Company, 1107 Broadway, New York City

Hubam Clover for Seed

For best results in seed production, the annual white sweet clover, now known as Hubam clover, should be seeded as soon as the soil can be worked in the spring. The Iowa Station recommends that for seed purposes, it be seeded at the rate of 3 lbs. per acre in rows 35 inches apart. This can be done by use of a grain drill, stopping all but 2 holes of a 10-hole drill. The rows should be straight so as to permit of cultivation when the clover is small, as it grows slowly for the first 4 to 6 weeks. It should be seeded very shallow and not over one-half inch deep.

The usual recommendations for lime, inoculation, and preparation of seed bed should be supplied for Hubam clover as for the other common legumes. When a seed crop is desired, it is preferable not to sow with grain as the plant necessarily has to make a new growth after harvest and there is doubt as to whether seed will set in any considerable quantity.

Closing up that open kitchen drain now will do much to banish mosquitoes from the porch next summer.

Have you talked with your neighbors about subscribing for Hoard's Dairyman? Why not do it now? Make up as large a club of subscribers as you can and send them in.

JERSEYS

Veterinary Advice From an Old Timer

HOARD'S DAIRYMAN:—In your issue of December 31, I have read an article on feeding cows oil meal to prevent retention of placenta.

Over fifty years ago, a chance visitor at my father's barn gave me some information about this.

Said he: "To have the cow all right, just have her gaining in flesh for three weeks before the calf is born. It is not a question of more or less fat, but whether she gains or loses at just that time."

I have handled cows ever since and experience has seemed to prove his theory correct and I find many dairymen so understand it. Oil meal is a fine feed, but there are others.

I decrease the meal ration as milk flow lessens and, four months before freshening, drop it entirely, then milk as usual for three weeks, once a day for three weeks, and then stop. In four days I strip the udder clean, then milk once a week until the cow is dry. If the milk gets thick I strip oftener. Usually five weeks before freshening the udder will begin to show some development, but should yield nothing.

Then is the time to begin feeding meal, not much corn or cottonseed, lest the udder get feverish. Silage and roots are good, but my main dependence is on early cut hay, plenty of bran, some oil meal, and a little corn. Milking too long and feeding too little before calving time are sure ways to secure no profit from the next milking period.

I also notice on the same page with this article two inquiries as to abortion, and in answer to one, speaking of preventives, you say, "It cannot be said that any one of them is a practical success." From experience with the disease in my herd, and others that are near, I am firm in the belief that carbolic acid properly used is an absolutely infallible remedy. Simple, safe, cheap, and easy to use. Just melt the crystals with very hot water around the bottle, turn into a large bottle and add ten times as much water. Feed a tablespoonful of the diluted acid once a day in a little bran or any grain that is being fed. Feed all the cows in the herd for a week then skip a week and so continue until within a month of calving time.

If any cows have aborted, wait six months before breeding them again, feeding them like the rest. I have had no trouble with cows becoming barren because of abortion.

All that is printed in dairy papers about isolation, disinfection, washing stables, etc., seems useless and senseless twaddle to lots of us old duffers who know, or think we do, that carbolic acid will stop all the trouble.

Vermont. D. A. KNEELAND.

This Week We Offer

This Splendid Line-Bred

Sir Pietertje Ormsby Mercedes Bull

Sir Jesse Skylark (307356)

Born February 25, 1920.

He is an excellent individual, well grown and of a rugged type. Through his pedigree he combines a most desirable line of breeding.

HIS SIRE:

SIR PIETERTJE SKYLARK ORMSBY—A young sire combining the blood of Duchess Skylark Ormsby and Sir Pietertje Ormsby Mercedes. He is by the only son of the only 1500-lb. cow and from a 940-lb. two-year-old daughter of Sir Pietertje Ormsby Mercedes, 14 daughters above 1000 lbs. and 60 averaging above 800. The next dam is a 1089-lb. four-year-old daughter of Colantha Johanna Champion (His dam 1247) and from a 1255-lb. daughter of Pietertje Maid Ormsby. Nine nearest dams of this sire average above 1000 lbs.

HIS DAM:

EDENVALE JESSIE ORMSBY—24.76 lbs. butter and 503.2 lbs. milk as a three-year-old. She is a show cow from end to end and one that will make a real record in the future. She is sired by Sir Pietertje Ormsby Mercedes 39th, one of the proven sons of old Sir P. O. M. The dam is from Jesse Rosanna Longfield, a daughter of Parthenea Longfield, a proven sire.

Price $500.00

E. C. Schroeder Farms, Moorhead, Minn.

(Herd Under Federal Supervision).

Minnesota Holsteins

Miss Korndyke Akkrummer Ormsby 30-lb. 4-year-old. 39.67 lbs. butter at full age. Owned and developed by J. B. Irwin.

For Your Next Herd Sire

get a son of Sir Ormsby Banostine Champion, son of Duchess Skylark Ormsby, world record cow. We have some good ones for sale from dams with good 7-day and year records.

Have For Sale

A Few Good Registered Cows and Heifers

We are somewhat overstocked at present so are offering a few good Minnesota bred females for sale. They are bred to King Pietertje Ormsby Pledge one of the good sons of King Pietertje Ormsby Piebe.

Our prices are reasonable. The females are guaranteed to be as represented. Write or come and see them.

EGIL BOECKMANN, White Bear Lake, Minn.

Lola Segis Pontiac Homestead

the highest record bull in southern Minnesota, heads our herd. His sire, Piebe Laura Ollie Homestead King, has more daughters that as 2-yr.-olds have produced 20,000 lbs. milk in a year than any other. His dam, a 34-lb. 4-year-old daughter of King Segis Pontiac Count, has 3 records averaging 33 lbs. and has made over 1,000 lbs. in 1 year. We have a few serviceable bulls and younger from A. R. O. dams for sale.

Clover Lea Farm, W. W. Walker, Owner. Austin, Minnesota

Sir Walker Segis Homestead

The best show bull and son of the great bull, PIEBE LAURA OLLIE HOMESTEAD, out of a "COUNT" daughter, BEAUTY BEETS WALKER SEGIS, world's greatest heifer, with two yearly records over 25,000 lbs. milk and 1,000 lbs. butter in heifer form, and a seven-day record of 35.03 lbs. butter from 730 lbs. milk.

We offer several choice bulls, one month to a year old, out of high yearly record and A. R. O. cows, at very reasonable present day prices. Pedigrees and photos will be sent.

A. J. LASHBROOK, - - Northfield, Minnesota

Sons of "COUNT"—

—"The Marvel of All Sires"

Whose daughters have broken more World's Records than the daughters of any other sire of the breed in both long and short time work. He has eight 1,000-lb. daughters.

Sons of "PIEBE" — "The Present Day Sensation"

The only bull in the world with five 20,000-lb. two-year-old daughters.

Sons of "COUNT" from daughters of "PIEBE"
Sons of "PIEBE" from daughters of "COUNT"

We have the finest line of young bulls we have ever raised at ARDEN FARMS, priced in accordance with present financial conditions. **LIBERAL TERMS GIVEN IF DESIRED.** Write me for particulars.

BUY DIRECT

Reasons for Buying Holstein Cattle in Waukesha County:

1. You can buy direct from the breeder through the breeders' association, organized by the breeders to promote the breeding of more and better Holstein cattle and to assist in a fair marketing of the same.
2. There are over 50 pure-bred Holstein sires in service in Waukesha County whose dams have records of over 30 lbs. butter in 7 days or 1,000 lbs. butter in a year.
3. There were 1,307 long-distance tests made on Holsteins in Waukesha County during the past year, which is more than the total in the next four leading counties in the state.
4. There are more tuberculin tested cattle in Waukesha than in any other county in the world.
5. The breeders' organization is in a position to put you in touch with "bred-for-production-stock" at reasonable prices.
6. When buying through the Association, you obtain the services of men who devote their entire time to the Holstein industry. It saves you time. You get more for your money.

Holstein Bulls, from $100 to $500

We have a few exceptionally good bulls from tested and untested cows that are sure to develop into excellent herd sires. They are priced very reasonably at $100 to $500, depending on breeding, age and individuality.

We also have a few exceptionally good young cows for sale at bargain prices.

Our herd is under Federal and State supervision. For full information write

BERTLEY FARMS, Glenwood, Ill.

We Offer a Yearling Son

Of King Pietertje Homestead Ormsby No. 221488, out of the State record Junior 2-year-old with a record of 17,860.2 lbs. of milk and 716.16 lbs. of butter. His name is Prince Korndyke Ormsby Fayne No. 323802 and he took 5th premium at the last Dairy Show as a Junior calf. Write for pedigree and price. Herd under Federal Supervision.

BUFFALO CREEK FARM,

H. L. BINGHAM, Supt., Arlington Heights, Ill.

For Immediate Acceptance—

Three young bulls ready for service—Holsteins.

No. 1—Sire a 30-lb. bull. Dam a 27.5-lb. cow. Price $300.00.

No. 2—Sire 30-lb. bull. Dam 23-lb. 3-year-old. Price $250.00.

No. 3—Sire 30-lb. bull. Dam 16-lb. cow. Price $100.00.

King of the Pontiacs breeding, well grown and good individuals. Send for extended pedigree.

R. F. JOHNSON, Assumption, Ill.

Send For Our Bull Sales List

Three bulls of serviceable age—four others will be old enough for service in a month or two—others three months old and older. Almost all of them sired by SIR ORMSBY BEAUTY PONTIAC SEGIS, the son of a 37-lb, 1112-lb. three-year-old daughter of KING SEGIS PONTIAC COUNT.

If it will be of an accommodation to the purchaser, we will accept a six months' note in payment, WITHOUT INTEREST, or will accept payment on installment plan basis.

Pinehurst Farms Co., Sheboygan Falls, Wis.

Bull Calves

by

SIR BESS ORMSBY FOBSE

out of

Cows with 7-day records now on semi-official; two-year-olds milking as high as 70 lbs. and mature up to 92 lbs.

ORMSBY BULL - Born Feb. 28, 1919

Sire, King Ormsby Pontiac De Nijlander, whose two nearest dams averaged over 30 lbs.

Dam, Aaltje Hengerveld Tritomia Segis. A. R. O. 17 lbs. at 3 yrs., next dam 29.68 in 7 days. Color light, fine individual. Ready for service. Price $300.

Fairview Stock Farm Whitewater, Wis., W. G. Marshall, Prop.

"Since I commenced to use the machine my cows increased 501 pounds the first month and 525 pounds the second month over the last month I milked by hand. I believe I have made 1025 pounds more milk than I would have had I continued to milk by hand. —E. W. EAYRS.

Increase Your Production With The Perfection

DO you want to increase the production of your herd? One dairyman got an increase of over 1000 pounds in two months. How did he do it? He milked his cows with the Perfection Milker. Get a Perfection and increase the production from your herd.

Hand milking is not the natural way of milking. Perfection duplicates the natural action of the calf. That's why cows give more milk. Perfection can be quickly adjusted to milk each cow in the way she likes best.

It's this natural action of the Perfection that enables thousands of owners to write and tell us about their increase in milk flow. They say their cows take to Perfection from the start.

Increased production is not the only way Perfection increases dairy profits. One man with a Perfection replaces three hand milkers. It saves you the time and wages of labor. It makes you less dependent on hired help and relieves you of drudgery. Can you afford to overlook this method of milking?

Investigate Perfection Way of Milking

Send for book, "What the Dairyman Wants to Know." We will also send you a list of Perfection owners names and addresses near you. Why Milk By Hand? Perfection increases production.

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Fort Atkinson, Wisconsin Volume LXI, No. 12 April 8, 1921

You Build But Once—Be Sure You Plan It Right

THE JAMES WAY

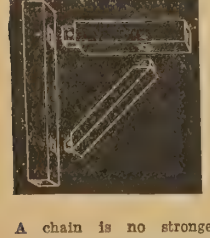
9 trusses for 100-ft. barn like this requires 706 board feet each. At $45 per M—$285.93.

Which is the better way?

TYPICAL TIMBER FRAME CONSTRUCTION

9 trusses like this requires 1266 board feet each; at $60 per M—$683.64. A difference of $397.71.

Mistakes on paper are easily rectified and buildings on paper are readily moved. Once built, changes can be made only at great expense.



It pays to plan a remodeling job or a new dairy barn, *on paper, before* the foundation is dug, *before* the carpenters come, *before* actual work is begun.

The dairy barn is your factory, your workshop, in use almost daily throughout the year.

If it is not built right, if it is not correctly planned, it may lose you money every day.

Wrong location of posts, inconvenient arrangement of feed bins and feed rooms, incorrect arrangement of carrier tracking or stalls or pens, or the wrong designing of the hay loft, may compel you to take more steps, do more work and pay out more money for help each day during the life of the barn.

Save Work Daily — Save Building Costs

A chain is no stronger than its weakest link. A timber is no stronger than its tenon.

A silo or a door in the wrong place, poor arrangement of equipment, ventilating intakes or outtakes improperly installed, mistakes in size in stall floors, gutters, passages and alleys—even these smaller errors may be a source of daily expense and annoyance.

A barn correctly designed and built right in every detail is a constant money maker because it is a constant money saver.

If rightly planned, cow comfort and cow cleanliness may be assured; plenty of light, abundant ventilation and easy disposal of litter will be provided; floor space will be used to best advantage; and all the chores made easy. In many a case, careful planning has cut barn work squarely in half.

What a barn will cost depends in no small degree on the care with which it is planned in advance.

It is no uncommon thing to see a man with the "Know how" build a barn at 20% to 30% less cost than another, although the barn accommodates the same number of cows.

And the man with the "Know how" gets a handsomer building, more convenient and better.

How to Get the Low Bid

Regardless of who designs the barn it is well to submit the final plans to several contractors, getting bids from each.

By having as many sets of blue prints and specifications as there are contractors figuring on the barn, you can safely let the contract to the lowest bidder.

You get the low price, and the successful bidder binds himself to give you the same workmanship, construction and materials as those who bid higher. You hold him to the blue prints and specifications.

National Clearing House of the Best Barn Ideas

To help our customers and others get the best barns possible, we, years ago, established the Jamesway Barn Plan Service under direct supervision of Mr. W. D. James, known as the leading dairy barn authority in the U. S.

Associated with him in this department is an architect and engineer of unusual experience in ventilation, reinforced concrete, steel work and structural design.

Another architect with many years of experience in planning, building and remodelling of dairy barns, a large force of skilled barn designers and draftsmen, and barn experts in charge of divisions of the field force, complete the office staff.

In the field, are more than sixty men who practically every day are consulted by farmers on remodeling and other barn problems, drawing preliminary plans and reporting new ideas and unusual conditions.

For years, Mr. James and these associates, have studied dairy barns—how to best remodel; construction, lighting, ventilation, drainage; how barns should be arranged for labor-saving. Every year they plan or help to plan thousands of dairy barns.

The experience and help of these men is yours for the asking. No charge is made excepting when complete plans and specifications are ordered.

Barn Book Free

Much of their experience and the best of their ideas are contained in a 320-page book which will be sent postpaid on request.

In addition to 28 pages of blue prints, 62 pages of pictures of barns in all sections of the country and many pages on barn planning, ventilation, remodeling, etc., this book tells all about James inventions that save so much of labor, prevent spread of disease, promote better cow health, make simpler the care of calves and sick cows, protect against dangerous bulls, and increase milk yields.

Write us now. Tell us what barn problems are bothering you; perhaps we can help solve them.

If you want the book, ask for Jamesway Book No. 23.

How Gurnee Solved the Rural School Problem

D. Q. GRABILL, WISCONSIN

THE rural school problem has been almost perfectly solved, and at the same time an answer provided to the question "How shall we keep our young people at home on the farm?" by the Warren Township High School at Gurnee, Lake County, Illinois.

For more than a generation, there has been a growing feeling that our rural education system did not meet the needs of an agricultural community. There was nothing in either the curriculum itself, or in the social activities of the school, in any way related to the life of the community. The school-house was little, it was set in a little school yard, it had the smallest possible amount of equipment, and the boys and the girls found no possible point of contact between school life and home life.

There has been nothing in our country schools to encourage a boy or girl to think of the problems of the farm or the home, and certainly they have never dreamed of bringing these problems to the school in an attempt to find a solution. The whole influence of the country school has been away from the farm.

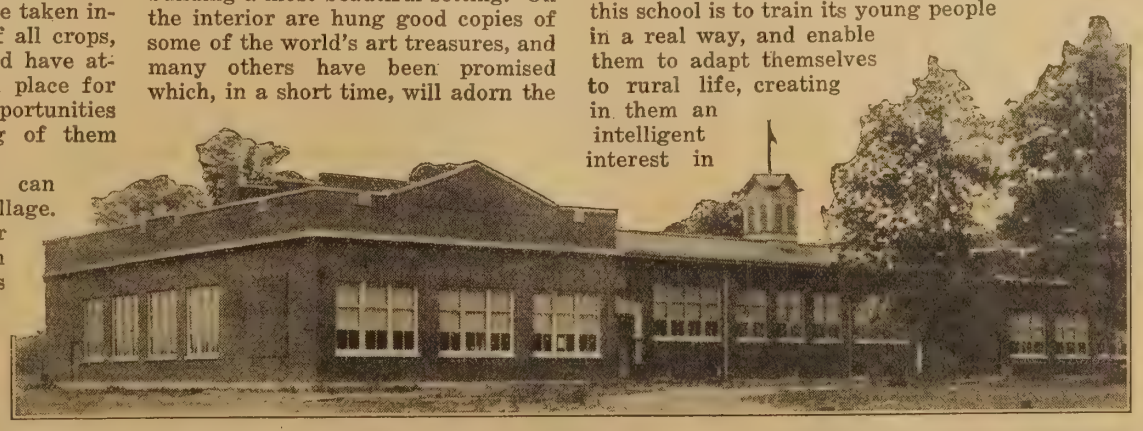
While many of our educators and leaders of rural opinion have recognized this condition, and both on the platform and in the press have insisted that it should be remedied, it is fortunate to know that at least one community in the United States has really solved the problem.

Lake County, at least the western two-thirds, is almost strictly agricultural, the dairy industry predominating. It has no unusual natural advantages. The soil is good, but there is just as good soil in many other sections of Illinois and many other states. The farmers, on the whole, are more prosperous than the average which is due to their belief in the dairy cow and the practice of intelligent methods of dairy farming.

Possibly the farmers in Warren Township, in some respects, are a little more progressive and have realized there is something else in life besides raising crops to feed good cows to produce milk. They have taken into account that greatest of all crops, the boys and the girls, and have attempted to provide a real place for them, increasing their opportunities for success while making of them the best possible citizens.

Gurnee is so small it can scarcely be called a village. Perhaps there are not over 75 people residing within what might be spoken of as the limits of the village, yet here is located one of the most perfect rural schools in the United States. It is the outgrowth of the desire of the farmers of Warren Township to provide more adequate high school facilities for their children. This desire became so strong that a consolidated high school was organized and tried out in temporary quarters for a year or two, with results that were so successful and hopeful that the school trustees, backed up by the sentiment of the township, decided to provide adequate housing and equipment facilities.

The new high school building is known not only throughout Lake County, but by all who have ever seen it, as "The school beautiful". It



PRACTICAL PRACTICE IN HOME ECONOMICS

is almost impossible to believe that out in a country community one can find a school-house equipped as this one is, and costing in the neighborhood of $85,000 and paid for through taxation by the prosperous farmers of Warren County.

The building is beautiful in external appearance and is both pleasing and practical in its internal arrangement. It is located in an ideal spot, with many natural forest trees surrounding it. The planting of shrubs and foliage plants in accordance with a carefully designed plan gives the building a most beautiful setting. On the interior are hung good copies of some of the world's art treasures, and many others have been promised which, in a short time, will adorn the walls of the main hall and various school rooms.

This point is emphasized because it is so important. There is nothing about the average rural school in any way attractive. The exterior is often ugly, and no thought has been given to the right sort of interior decorating. Children of school age are unconsciously influenced by the appearance of the school building as well as by the appearance of their own home. The trustees and the faculty of Warren Township High School have been wise enough to recognize this fact, and no student can pass through this modern rural school without being influenced toward better things and higher ideals by the appearance of the building itself, and by the class of pictures which adorn the walls.

Of course, there is the regular standard course of study one expects in any modern, first class high school, but which we have hardly ever been optimistic enough to expect to see in a really rural community, but the school trustees and the principal, Mr. R. B. Henley, have realized that if this school is to train its young people in a real way, and enable them to adapt themselves to rural life, creating in them an intelligent interest in the things of the farm, other studies and activities must be provided.

A HIGH SCHOOL AT GURNEE, ILLINOIS, WHICH HELPS ANSWER THE QUESTION, "HOW SHALL WE KEEP OUR YOUNG PEOPLE AT HOME ON THE FARM?" THE BUILDING IS BEAUTIFUL IN EXTERNAL APPEARANCE AND IS BOTH PLEASING AND PRACTICAL IN ITS INTERNAL ARRANGEMENT

Naturally, there exists a very strong agricultural department fully awake to its opportunities. This department is indirectly connected with the normal farm organizations of the township and county. The county grain show was held in the school last year, managed by the farm bureau. The farmers' institute was held in co-operation with the regular farmers' institute organization. Whenever the county adviser wishes to meet the farmers of this part of the county, and consult with them on their problems, the natural meeting place is in the agricultural department of the consolidated high school at Gurnee. The work of this department has become so important it is now housed in a separate building, while still using the laboratories and library of the main building.

Each year, the school offers a short course of two weeks, having the cooperation of university and state extension workers, in farm and rural life opportunities. This year, the short course was held during the third week of February. One day was known as patriotic day, one was devoted exclusively to hogs and beef cattle, one to dairying, one to soil and fertilizer. Every session was largely attended, and intelligent interest created in the special subjects, as well as in general farm conditions. Each day there is at least one talk of general interest, then sectional meetings for men on farm problems and for the women on some phase of home economics. The evenings are given over to popular lectures and entertainment programs.

Last year the class in farm mechanics constructed a model farm repair shop. It is completely equipped in every detail and the boys with the aid of their instructors did all the work. As a further addition to the equipment, a hog house and a poultry house have been constructed on the grounds and enough animals of this type provided to be used for demonstration purposes. The course was built around this, as a class project, and included the planning and construction of buildings, together with the installation of such machinery as should be in a farm shop. The machines, themselves, were carefully studied, together with methods of selection, of care and repair, thus relating the school directly with the practical life of the farm.

In the regular Manual Training Department, the students enjoy the

(Continued on page 504)

MARKETING BY FEDERATIONS

THEODORE MACKLIN, Wisconsin College of Agriculture

The viewpoint of an agricultural economist on the big problem of marketing farm crops, with his analysis of the operation of the Wisconsin Cheese Producers' Federation. In a subsequent issue there will appear a discussion of the federation by Math Michels, giving the viewpoint of a successful and practical cheese factory operator and dairy farmer well known in Wisconsin.

MANY farmers would like to have their products marketed by their own co-operatively employed middlemen. In the past, agitation along this line has resulted in numerous, small, local marketing concerns. These disconnected local cheese factories, creameries, live stock shipping associations, and other companies have been unable to do more than influence conditions locally. Farmers desire to accomplish more than this. They want to control both local and terminal conditions. Their ambition is to build up a system which will enable farmers to retain ownership of their products until consumers need them. This they can accomplish only by having their own middlemen. Farmers are weary of a system in which farm products pass into other people's hands at low prices to be held until needed by consumers and then sold at much higher prices.

Functions of Middlemen

Without finding out just what the different kinds of middlemen actually do with the products they buy, the farmer considers them all part of a bad system. As a matter of fact, some marketing concerns do no storing. Having an established patronage they buy regardless of price in order to deliver the goods to their customers. These concerns care very little how high or how low the price may be. They buy just as much one time as another because they deal with retailers who must have the goods for their customers. Such middlemen make their profits from a rather fixed and narrow margin. To make much money they must sell immense quantities.

Another kind of middleman specializes almost entirely on the holding of farm products from the time that farmers sell, shortly after they are produced, until consumers want them. Naturally, these middlemen desire to pay as little as possible. They are equally anxious to sell these goods at the highest possible prices. Unlike the first kind of middlemen, whose volume of business is assured and who are almost certain to make reasonable money, this second kind of middlemen must take a chance in buying with the possibility of either heavy losses or handsome gains. They must risk their judgment that prices will be enough higher later on to justify them in paying what they do when buying. Virtually all farm products are harvested and become available on farms in greater quantities during a part of the year than can be consumed in the same period. During the balance of the year less of these products are produced than consumers require. If part of the plentiful supply, during summer and fall, were not stored until winter and spring, there would be a part of the year in which people would be unable to secure sufficient food.

Need for Storing Farm Products

Someone must serve the public by storing farm products. The farmer mistakenly condemns the service when in reality he is dissatisfied merely because this service is controlled by private middlemen. As a matter of fact, a number of people may store products. The farmers may store some on their farms. But because farmers do not store the greater part of the seasonal surplus of products it is inevitable that middlemen should be in the storage business. It is equally certain that if private middlemen are to render this service they will endeavor to buy at low prices and to sell at high prices. Farmers are finding out that not all farm products can be as cheaply stored on farms as they can be in warehouses. Since there are three important kinds of middlemen —the private, the co-operative, and the governmental—farmers who desire to co-operate are legally and morally just as much entitled to develop marketing enterprises as anyone.

Federations Subject to Losses Same as Private Concerns

In establishing warehouses and in securing managers to market their products, however, farmers are in reality employing middlemen on a salary rather than a profit basis. Precisely the same methods of marketing are followed by private and co-operative agencies. Risks, due to changing prices, which private agencies have been accustomed to take, must also be taken by co-operative agencies. Farmers should realize, therefore, that in marketing products through the efforts of their own federations they must be willing to be hit by losses. Formation of co-operative federations shifts upon a group of farmers the responsibilities and problems formerly confronting private middlemen. To the extent that farmers are willing to assume these duties and risks loyally and continuously with full recognition of the obligations, they have prospects of success. They might well plan to establish co-operative federations to hold products from harvest time until they are needed by consumers, instead of leaving this phase of marketing to private middlemen. With such a system all those products which must be held over, but which cannot wisely be farm-stored, may be stored by co-operative middlemen. Farmers then would not be obliged to part with their products at depressed and unnecessarily low prices. They would not part with their products at all, until they are sold for continuous movement to consumers.

Financing Surplus Hold-over

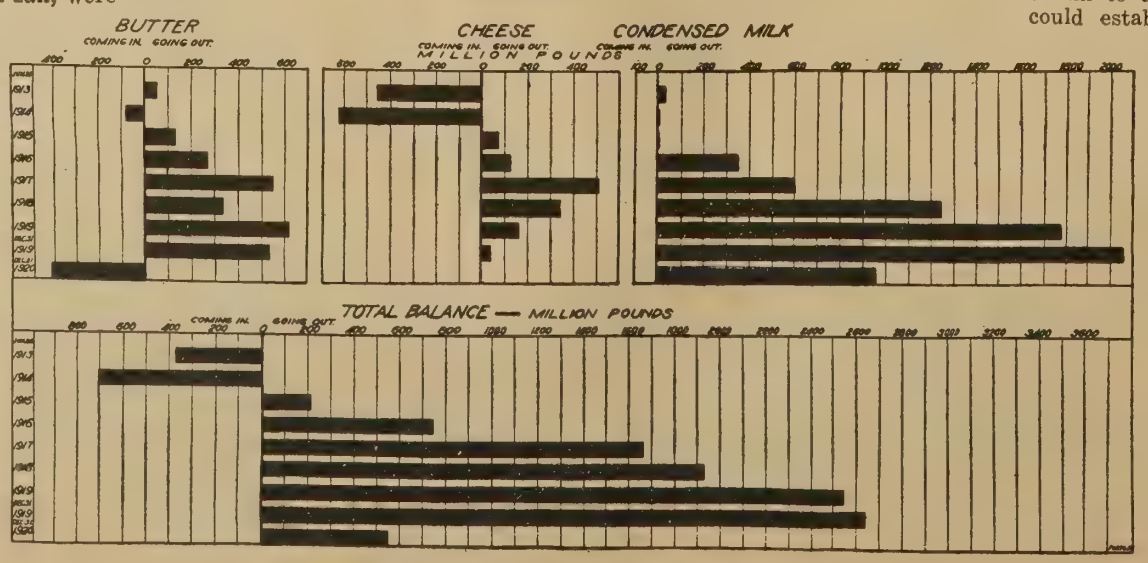
If farmers wish to hold over surplus portions of their products to be marketed by hired middlemen instead of by private concerns, they must be willing to (1) delay payment to themselves until the products have been sold and cash received, or (2) they must obtain loans based upon their stored goods as security. In the past, private middlemen have provided the funds to pay farmers for their products. If farmers expect to market products co-operatively and are unwilling or unable to wait for their returns, they are obliged to cope with the problem of financing. While most farmers, hitherto, have preferred to accept lower prices rather than risk holding products for an uncertain future price, there are certain advantages to be gained by having this service provided co-operatively.

Advantages of Co-operative Service

By delaying the sale of products until they are to go forward to consumers, farmers can prevent a large part of the yearly fluctuation in the prices of farm products. The temporary surplus of certain seasons would be stored co-operatively instead of going onto the market as at present with the common seasonal falling of prices as a result.

In coming to realize that local marketing associations are too small to hold farm products until they are needed for direct movement to consumers, farmers are learning the importance of having marketing federations. A marketing system, if it is to be really efficient, must control the movement of farm products from farm to consumer. It must deliver goods in good variety, in proper quality and quantity, and when consumers want them. It must also give the farmer the greatest possible proportion of what the consumer pays. To obtain this ideal, farmers have learned that they must bind their local associations into powerful united organizations employing the most expert management to be had. To feed farm products to the market, without creating either glutted conditions or shortages, requires very large scale marketing. This means that the marketing concern which does this feeding must have a tremendous volume of business. To secure such a great volume of products and in turn to feed it to the market makes necessary both numerous local branches for assembling the products and numerous distributing connections for disposing of them. The fully developed federation is able to accomplish these objects. Disconnected local associations are not.

Co-operation in Practice



Co-operative marketing federations are being successfully developed by farmers in many sections of the United States. Up to the present the federations in California, such as the California Fruit Growers' Exchange, the California Prune and Apricot Growers, Inc., The California Associated Raisin Co., and many others have been the most widely known. Following the lead of these older federations, farmers in California are now united, both in local and in federated organizations, to market various kinds of large and small fruits, nuts, eggs, poultry, milk, rice, and other products. These federations are actually doing what many conservative people have regarded for years as impossible for farmers to accomplish. In the light of their success it is no wonder that farmers of other states are looking to California for inspiration and guidance.

Wisconsin Cheese Federation

Wisconsin farmers have within their home state a federation of notable success. What it is doing for the producers of American cheese, a similar federation could easily do for the producers of foreign cheese. Still other federations could be created by combining as separate groups local co-operative creameries, live stock shipping associations, fruit marketing concerns, and the other farmer marketing companies. Farmers might have a co-operative feed warehouse in each town, and a central federation including all of the local warehouses. The co-operative federation could then mix feeds and distribute them to the local warehouses. High testing cottonseed meal could be purchased directly from Texas and other states having this high testing protein concentrate. Farmers now supplying cream to a number of small buyers could establish at their respective shipping points a single co-operative cream station. Each of these in turn would be part of a cream station federation. This federation could then operate a co-operative centralized creamery and market butter in the cheapest manner.

In federating local marketing concerns farmers will have much of interest to read in the experience and progress of the Wisconsin Cheese Producers' Federation. Because it is both a success and a home prod-

(Continued on page 492)

DEMONSTRATIONS CONVINCE

L. F. GRABER, WISCONSIN

ONE 25-CENT BOTTLE OF SEED INOCULATION MADE THE DIFFERENCE

Inoculation of the soy bean seed with experiment station inoculation culture more than doubled the yields of hay and seed on this run-down, sandy soil.

IN a sense it is logical to suppose that the demonstration idea was started in Missouri, for at best demonstrations are real "show me" propositions. Be that as it may, let me take you up in the little county of Green Lake, Wisconsin, where one James Lacey—"Jim" as he is popularly called—has been holding forth in the capacity of county agricultural agent since the establishment of this functional rural service two years ago. I mean to say that if "seeing is believing" you will be convinced that no matter where the demonstration idea had its inception, it is receiving the most thorough application as the principal and outstanding feature of this county agent's activities. Frankly this epistle is not particularly concerned about Jim himself, but it is concerned with the efficacy of "show me" methods in delivering the goods agriculturally and as an illustration Lacey is hereby mildly inaugurated as the goat of this dissertation.

In passing I'll just say that he is a big, broad shouldered, hale, hearty, well-met fellow, full of hustle and bustle, with genuine enthusiasm back of what he is trying to accomplish. No—he is not much of a talker, but when he says anything it is definite and comes right straight from the shoulder. He believes in making his work speak for itself and perhaps that is why he is capitalizing demonstration activities to the limit. But, as I said, we are not so much interested in Jim Lacey as we are in demonstrations for putting county agent work across.

Thirty Thousand Acres Inoculated by Demonstrations

A year ago he established a soy bean inoculation demonstration on a light blow sand in a prominent corner field on the main road to the little town of Princeton. For twenty-one years this field had not been blessed with a single crop of clover. At best it would probably produce ten bushels of rye an acre. These were facts widely known over that entire community. Lacey planted one acre of soy beans. Half of the seed was inoculated with culture that was available to farmers from the experiment station and the other half was not inoculated. The beans came up in splendid shape, but the variation in growth was amazing. That a little twenty-five cent bottle of seed inoculation should have made the difference between success and failure in that field was almost unbelievable, still the most skeptical were convinced. The inoculated soys were a healthy, dark green growth of about twenty inches compared with a sickly, yellowish, spindly green growth of not more than ten inches for the uninoculated beans.

Some of those who attended the demonstration asked for assurance that two varieties of soy beans had not been used. "Inoculation on this kind of land speaks for itself," said Jim. "Come in and pull up the plants of the inoculated and uninoculated rows and see for yourself." They did and where the seed had been treated with cultures the plants were not only large and healthy, but the roots were covered with nodules, while not a nodule was found on the sickly yellow uninoculated soys. The relation of all this to soil improvement was brought out when Jim stated that those nodules were nitrogen fertilizer factories, the true function of which had only become known some thirty years ago and which were worth thousands of dollars to that community in the way of soil enrichment. This is one of several such demonstrations which have largely brought about the use of inoculation culture on legume crops covering more than 30,000 acres of land in Wisconsin during the past year.

Roadside Signs Advertise Demonstration Proofs

Go along most any road in Green Lake County, you will see prominently among the customary wayside ads, Lacey's demonstration labels with fields back of them to prove his contentions. "Lime, inoculation, and manure make alfalfa doubly sure. Here is the proof," "Do fertilizers pay?" "Walk through this field and see for yourself." "Seeing is believing. See how inoculation has helped this sandy soil," etc., are signs which loom out pronouncedly and have a most wholesome effect on the hundreds of travelers who would otherwise have passed the demonstration fields without notice.

"It pays to advertise," he declared. "I believe it just as important in extension work as for the salesman out in the commercial field."

Of course, Lacey has a splendid opportunity for soil and crop demonstrations, for his county has soils which range all the way from the lightest sands up to the heavy black prairie loams.

That alfalfa can be grown on this wide range of soil conditions and types is the object of a series of splendid alfalfa, lime, and inoculation demonstrations. On G. B. Horner's farm, for instance, where at Lacey's direction a ten-acre field was limed and inoculated and Grimm alfalfa seed sown a year ago, 4.6 tons of cured hay per acre were secured in two cuttings this past season and a fall growth of fully fifteen inches obtained in October. This was left for winter protection. It was one of the finest stands and growths I had observed for a one-year-old field.

Demonstrations for Wholesale Results

Demonstrations are not necessarily easy to put across. They require a bed rock understanding of the ins and outs and isms of the proposition to be demonstrated and a multiplicity of detail is often times required to establish some of these "show me" shows.

At the outset the whole sum and substance of a demonstration should be to prove, to show, to convince, to substantiate that the proposition, the idea, the doctrine—whatever you want to call it—to be put across, is a paying practical proposition. There are any number of first rate farmers who agree that lime is good for the soil—that fertilizers help, that the right kind of seed is at the foundation of a good crop, that the better sires mean better calves and all that—but to get these things going on a community basis—to produce a widespread and virile inoculation of these ideas often requires more than oratorical or rhetorical assurance. And this is where the demonstration supplies a connecting link in that endless and proverbial campaign for bigger and better crops and more and better live stock.

For example, down in Green County, Wisconsin, where our friend, Lacey, was on the job for a short period we put in an alfalfa-lime demonstration. This is one of the biggest alfalfa growing counties in the state—

PROOF OF THE PUDDING

Ground limestone more than doubled the yields in this demonstrational test.

still there were many failures—many poor, unsatisfactory fields of alfalfa in that county, largely due to a need of limestone in the surface soil.

Practice What You Preach

As a community matter it was hard to convince these splendid farmers that a lime deficiency could obtain on their land, for there are outcroppings of limestone along almost every road.

While it might have sounded reasonable to say that the abundant annual rainfall, together with the years of cultivation, had leached so much of the lime out of the surface eight inches of soil that a deficiency and consequent sour condition obtained, which made alfalfa and oftentimes clover very problematic in their growth—this sort of eloquence did not bring prompt results. Lacey tested some 226 soil samples, 149 of which showed a lime requirement of from two to four tons per acre. But this information and all the previous agitation at farmers' meetings and local gatherings, a large number of which I attended myself (which may explain the weakness of the situation), was not really sufficient to put this liming proposition over on a big scale. But a demonstration did the trick and I want to tell you about it.

Out on the county farm, where land was selling around $300 an acre, they had had trouble growing alfalfa. Clover did fairly well but alfalfa was considered fearfully and wonderfully made. Superintendent Whitcomb gave us the privilege of trying our hands at alfalfa growing—a chance to "practice what you preach," as he remarked. This land was sour. It required between four and five tons per acre of finely ground limestone, according to Truog's test. We got the lime—put it on, except for a 30-foot strip through the center of the field, and in the spring of 1918 sowed the alfalfa—several kinds—with one bushel of barley as a nurse crop.

Alfalfa Jaundice Cured

Despite a very droughty summer a good stand obtained in the fall, largely due to the "play-safe" precaution of cutting the nurse crop for hay and getting it off early to give the alfalfa a chance to prepare itself for dry weather. There was but little observable benefit from the lime, due largely to the slow growth of the alfalfa the first season. The following spring the alfalfa all started out fine. Many who

SEEING IS BELIEVING

These Green County farmers are seeing for themselves what ground limestone did for alfalfa.

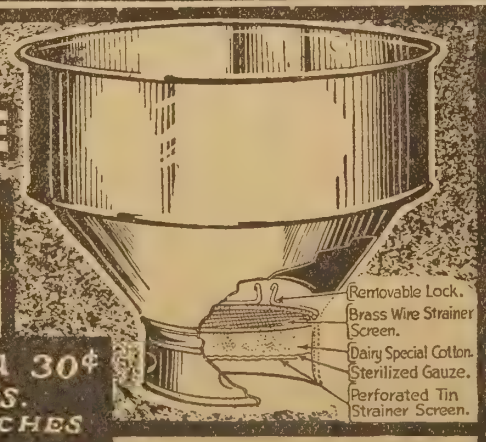
Bring Me A City!

Heeding no barrier of river, mountain, forest or desert; unmindful of distance; the telephone has spread its network of communication to the farthest outposts of our country.

The ranchman, a score of miles from his nearest neighbor, a hundred miles from the nearest town, may sit in the solitude of his prairie home and, at will, order the far-distant city brought to him. And the telephone obeys his command.

Time and space become of small account when, through desire or necessity, you would call across a continent.

This is what the "Long Distance" service of the Bell telephone has accomplished for you; what science in construction has created; and what efficiency of workers has maintained.



You take the telephone as much for granted as you do the wonder of the changing seasons. You accept as a matter of course the company's ability to keep all the parts of this great nation in constant contact.

By so doing you offer a fine tribute to the Bell organization which has created this "Long Distance" service—a service no other country has attempted to equal.

Association Notes

Southern Franklin County, Pennsylvania—During February four unprofitable cows were sold. Several members have started feeding home balanced rations, some according to production. No steps have been taken toward co-operative buying of feed. February market milk testing 3.5% sold for $3 per cwt. and 4c per point above. The condensery paid 50c per lb. for fat, and in addition $1 per cwt. milk. The creamery paid 47c per lb. for fat. Milk retails for 10—12c per quart, butter for 45c per lb., and cheese for 28c per lb. Feed prices are: Unicorn, $56 per ton; Union Grains, $53; cottonseed meal, $45; linseed meal, $50; Larro, $52; hay, $20; corn silage, $8; corn stover, $6.

North Branch, Pennsylvania—One member discontinued work, stating he guessed "it didn't pay". His herd would have probably averaged 4,500 lbs. milk per year. By his action, this association becomes 100% efficient in the use of pure-bred sires. Two pure-bred bulls were purchased in February. One member is feeding potatoes, rather than sell them at 35c per bushel, and satisfying results are shown. Three per cent market milk sold for $3.38 per cwt. and 4c per point above. Milk retails for 12c per quart, butter for 52c per lb., and cheese for 35c per lb. Feed prices are: Mixed hay, $20 per ton; corn silage, $8; potatoes, $12; root crops, $8; wheat bran, $40; corn and cob meal, $24; ground oats, $28; cottonseed meal, $60; linseed meal, $55.

Troy, Pennsylvania—Ten poor cows were sold during February. Feeds here are rated as follows: Gluten, $57 per ton; ground oats, $40; oil meal, $55; corn meal, $38; cottonseed meal, $52; bran, $42.

Canaan, Connecticut—A co-operative grain buying association has been formed. Balanced grain rations are being fed more extensively. February 3% milk sold for $2.67 per cwt. and 4c per point above. Feed prices are: Hay, $20 per ton; silage, $6; cottonseed meal, $40; oil meal, $42; oats, $38; corn meal, $38; gluten, $45; bran, $40; beet pulp, $45; middlings, $40.

East Aurora, New York—As the price of milk decreases, the members are paying greater attention to feedin problems, endeavoring to keep as wide a margin of profit as possible. Several good cows are being fitted for official records. One member recently held a sale and his association records added greatly to the success of the sale, all cows bringing good prices in spite of the light demand for cows at this time. Three per cent market milk sold for $2.42 per cwt. and 4c per point above. The creamery paid 50c per lb. for fat. Milk retails for 11c per quart, butter for 60c per lb., and cheese for 45c per lb. Feed prices are: Hay, $20 per ton; silage, $6; gluten feed, $48; bran, $38; corn meal, $40; oil meal, $48; D. D. grains, $56; cottonseed meal, $50; ground oats, $40.

Fairfax County No. 1, Virginia—Three unprofitable cows were sold in March and one bull calf and one three-year-old bull were brought into the association. Twenty-one cows and two heifers were bought by

(Continued on page 494)

GUERNSEY COW, NEDRA OF CHICONA, LEADING COW IN THE SOUTH-WESTERN WASHINGTON COW TESTING ASSOCIATION

She has a record of 505 lbs. fat and had two calves within a year. She was owned by A. L. Gile, Washington, who sold her to Wm. Bues, Washington.

The Birthday of an Idea

Broome County, New York, Celebrates Tenth Anniversary of the First Farm Bureau

ON March 21, at Binghamton, New York, Broome County commemorated the tenth birthday of the farm bureau idea. Ten years before, March 20, 1911, the American Farm Bureau Federation had its beginning. On that date a committee representing the Binghamton Chamber of Commerce, the Lackawanna Railroad, and local farmers met in the Chamber of Commerce rooms, laid out a program of work on farms, and employed John H. Barron, the first county agricultural agent in the northern and western states. The meeting last month was a celebration of the rapid spread of the idea, originating only a decade ago, the idea of the county agent movement in the north and west—the forerunner of the farm bureau.

The first half of the day's program before an attendance which numbered several hundred was a review of the origin of the farm bureau plan and its growth until there are now 1,166 county agents employed in the northern and western states and over 2,000 in the whole country. In the North and West there are now over 1,000,000 farm bureau members, with several hundred thousand more in the South.

W. J. Spillman, formerly with the United States Department of Agriculture, was credited by Chairman S. L. Strivings with being the first to conceive the county agent plan for agricultural improvement. In his remarks Mr. Spillman told of the preliminary visits among Broome County farmers before an agent was employed. B. H. Gitchell, who as secretary of the Chamber of Commerce persuaded that organization to assist in the movement, gave credit to the Roosevelt Country Life Commission for the inspiration which resulted in starting the work. John Deegan, representing the Lackawanna Railroad, told of its assistance in "fostering the infant" which has made so remarkable development. W. A. Lloyd represented the Department of Agriculture in the important relation it bears to the farm bureau.

A strikingly unique representation of the founding and development of the first farm bureau in the United States was given in a three-scene pageant. Most of the principals of the drama actually enacted ten years ago took part, the illustration published herewith showing a number

The first scene represented the March 20, 1911, meeting, at which the farmers, the Chamber of Commerce, and the railroad representatives agreed upon a working plan and employed Mr. Barron.

The second scene portrayed a meeting held October 13, 1914, in which it was voted that the farmers themselves would take over the work, which to that date had been a bureau of the Binghamton Chamber of Commerce. "This step marked the inception of the farm bureau as it now exists in the United States—an organization for, of, and by the farmers themselves."

The third scene is one familiar to many farm bureau members. It showed an executive committee of the Broome County Farm Bureau January 15, 1921, at which such business as is now carried on in the great number of bureaus was transacted. The "idea" was shown "full grown".

In the afternoon Dean A. R. Mann of the New York College of Agriculture introduced three speakers and made some very appropriate remarks at the close of the day's program.

S. L. Strivings, president of the New York Farm Bureau Federation, declared, "The farm bureau cannot be viewed wholly as an economic organization. It is educational and, therefore, ethical." He outlined the need for educational, social, and spiritual betterment of farm life and said, "Our greatest poverty is the lack of rural leadership".

Mrs. A. E. Brigden, president of the New York Federation of Home Bureaus, outlined the growth and the work of the "farm bureau's sister". She stated that while there were only four county home bureaus previous to the war there are now twenty-nine in the state. New York organized the first state federation.

O. E. Bradfute, president of the Ohio Farm Bureau Federation and vice-president of the American Farm Bureau Federation, discussed the work the latter organization is doing and reviewed its development. The first organization meeting was held in Ithaca, New York, in February, 1919, where twelve states were represented. In November of that year thirty-three states sent delegates to a meeting in Chicago when a constitution and by-laws were drawn up. By March, 1920, twenty-eight states had ratified the constitution. At present, says Mr. Bradfute, only two states are not organized wholly or in part.

Above, left to right—Chas. Moore who represented the Binghamton Chamber of Commerce in the March 20, 1911, meeting; J. F. Eastman, Broome County Agricultural Agent since January 1, 1911; Hugh Failey; Robert Eggleston; Wm. Golden; G. W. Young, present member executive committee; R. A. Gray, present treasurer. Seated, left to right—Wm. Adams; John Deegan, Lakawanna Railroad; A. A. Walling, one of committee which voted to make the bureau a farmers' organization at the October 13, 1914, meeting and present chairman of the executive committee; L. J. English, a member since the beginning, March 20, 1911; M. C. Burritt, State County Agent Leader who proposed formation of farm bureau at October 13, 1914, meeting; James Quinn, a member since March 20, 1911, chairman in 1914, and at present vice-president of bureau.

A Good Word for Sunflowers

HOARD'S DAIRYMAN:—Reading the good and bad results about sunflower silage decided me to give it a fair trial. I had the seed ordered early but it did not reach me until May 30, 1920. By that time, I had my corn all planted and one field had received its first cultivation. I noticed that some of the corn was missing so took hand planters and planted the sunflower seed wherever there was room. The corn kept ahead in growth until it was eared out, so that it can be seen that the sunflowers did not interfere with its growth. When the corn was ready for the silo, some of the sunflower seeds were in the milk stage but the most of them were solid. The stalks were not very coarse as there were four to five plants in a hill and the hills were about 14 inches apart in the row. Some stalks had as many as 50 leaves.

I was not troubled in cutting or filling. The sunflowers were as tall as the corn and some were larger. People have told me that in raising sunflowers alone, the stalks become too coarse and are hard to handle. With my method of planting, two men can plant a good many hills in a day if there is any work in them.

Having three silos, I filled one of them with the mixture of corn and sunflowers. This past winter I used the mixed ensilage for the cows kept in one barn. The cows ate every bit of the silage. I fed them up to 40 to 50 lbs. a day and they did fine on it—not alone in appearance but also in flow of milk. I have taken cows from one barn to another and after they had been fed the mixed ration a few days, I have noticed an increase in the flow of milk.

I can recommend the mixed planting to anybody. I invite those who are interested in this crop to come to my farm and be convinced of its value.

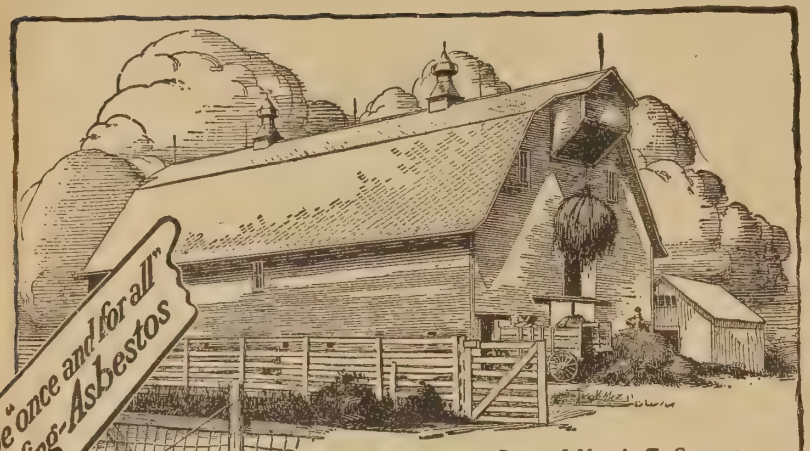
J. M.
Mukwonago, Wis.

You owe it to the boss to be steadfastly loyal and to give a full, honest, good measure day's work every day.

The boss, then, owes you a fair wage, a wholesome working place, co-operation with your efforts to make yourself more efficient, and a friendly personal interest. — FRANK ANDREWS FALL.

Rachmaninoff himself chose the Victor

Rachmaninoff knows music. Knows how to compose it, how to play it—and how it should be reproduced. It is significant that the great composer-pianist in the light of previous experience has chosen to associate himself with the other famous artists of the world who make records for the Victor.



Hear Rachmaninoff's Victor Record of Mendelssohn's "Spinning Song" played on the Victrola and you hear the great pianist exactly as he wishes you to hear his own work.

Victrolas $25 to $1500. Write to us for catalogs and name of nearest Victor dealer.

Victor Talking Machine Co., Camden, N. J.

Barn of Mr. A. T. Sumner, Milford, Ill., roofed with Johns-Manville Asbestos Shingles.

If a banker owned your barn he'd have Asbestos Roofing on it

YOUR barn is the storehouse for your wealth — live stock and crops.

Insurance of wealth is a sound banking principle that is inducing economical farmers all over the country to use Johns-Manville Asbestos Roofing.

Not only does an Asbestos Roof protect live stock and crops from bad weather and fire, but, being a permanent roof, it is most economical.

Fast becoming America's standard farm roof

Go east, go west, go anywhere throughout the farmlands of America and you will see barns roofed with Johns-Manville Asbestos, either in shingle or roll form — large barns and small barns, whose owners value both appearance and economy.

The great economy of Johns-Manville Asbestos Roofing is apparent, for, during the life of the building it protects, it remains unchanged, unharmed by the elements which attack other roofings less fortunately endowed in weather and time resistance. So it is actually less expensive than any other roofing.

Fire-safe, of course

The fire-safety of Asbestos Roofing is so generally known that we need only mention the fact that the Underwriters' Laboratories, Inc., whose business it is to classify building material in relation to fire-risk, give to Asbestos Roofings the highest classifications—an irreproachable endorsement.

Because it is all-mineral, Johns-Manville Asbestos Roofing is impervious to rain or snow, dampness or wind. Like the rocks in your field, it is immune to rot, corrosion and disintegration.

Your local dealer has Asbestos Roofing in several varieties selected for farm building service out of the complete line of Johns-Manville Asbestos Roofings which include material for any type of building.

Booklets on each or all of these types sent on request:

Johns-Manville Asbestos Shingles in gray, brown and red. Ready Roll Roofing for sloping roofs. Built-Up Roofing for flat roofs. Corrugated Asbestos Roofing for skeleton frame buildings.

Lay them right over the old wooden shingles

Johns-Manville Asbestos Shingles can be laid this way—we recommend it without reservation. This booklet tells how and why. The farmer with an eye to economy and permanence in his farm roofs will want to read it. Write for it!

Marketing by Federations

(Continued from page 488)

uct it may well be taken as a guide. The difficulties which have been met and overcome, the problems which are unsolved, the method of organization, and the success won, all mean much to those who will sooner or later federate the co-operative concerns marketing other products.

How the Federation was Organized

Before the cheese producers of Sheboygan County, Wisconsin, formed their infant federation, there was much dissatisfaction. The farmers felt certain that the Plymouth Board prices were manipulated downward for the special advantage of its members. They were sure that private cheese buyers were unfair in refusing to pay for fractional weights of cheese. They were also convinced that many unfair practices were used by cheese buyers and cheese makers to the detriment of the producers. Out of the general desire to improve these conditions, Sheboygan County cheese producers—led by Henry Krumrey—organized their federation. At first they had a membership of 45 local cheese factory associations. A manager was employed to supervise the handling of cheese at a warehouse in Plymouth and to sell cheese assembled at this point. On April 1st, 1914, the new management began to receive cheese and was faced with the problem of selling it.

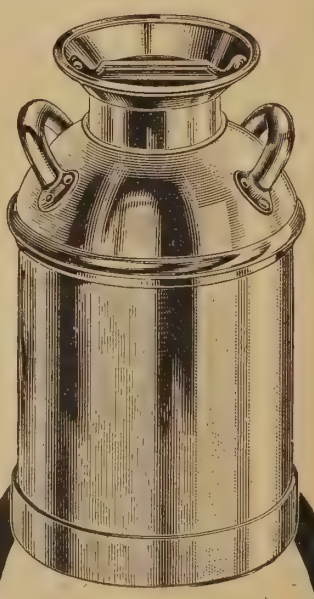
Increase in Value of Federation's Business Shown by Total Annual Payments to Factories

Year	Paid to factories for cheese	Paid to factories each year for each dollar paid in 1914	Net price per lb. for cheese paid to factories	Per cent increase over year 1914
1914	$ 855,328.64	$1.00	14.302	
1915	1,115,792.20	1.30	15.085	5.4
1916	1,300,520.24	1.53	17.567	22.8
1917	2,144,005.05	2.51	24.087	68.4
1918	2,258,163.73	2.64	27.052	89.1
1919	4,243,938.56	4.96	30.108	115.4

Marketing Problems

The new concern had a volume of business assured but no outlet for its cheese. A marketing federation must have both a source from which products are drawn and outlets to forward them to consumers. It was not surprising then that this new cheese federation was met by serious problems. First, it was obliged to pay farmers for cheese before the cheese was sold. Second, it lacked connections which would enable it actually to sell cheese. With no outlets of its own, it was forced to sell to other cheese concerns which had contact with consuming centers. It was unavoidable, therefore, that the cheese federation should sell most of its cheese during the first few years to large packers and others with numerous and dependable cheese customers. This, however, was remedied as soon as the management was able to go out and solicit its own regular customers. How much this customer trade has been built up is shown by the fact that during 1919 less than 6 per cent of the federation's cheese was shipped to the five larger packers. The early lack of market connections which was the most serious weakness of the federation has been largely overcome.

Problems of Distribution



As the federation established enough of its own customers to take all its cheese and thereby become independent in selling, it faced increasingly severe and unfair competition on the supply or membership end. A co-operative marketing concern rapidly growing both in assembling products and in distributing them spelled eventual ruin to the many private concerns which had marketed the cheese for the local factories before. Much unfair competition apparently developed in the struggle for survival between the federation and its private competitors.

Growth of Federation

In spite of obstacles, the Cheese Federation has made substantial growth. During 1919, it handled 6 per cent or 14,098,021 pounds of the total of 235,740,173 pounds of American cheese produced in Wisconsin. Far more important than volume of business, it has shown that Wisconsin farmers can unite their local associations. It has proved that such federations can hire experts who will efficiently sell products in consuming markets. Furthermore, it has made Wisconsin farmers think in terms of comprehensive marketing systems. While this undertaking has not done all that farmers want to accomplish, it has gone as far as its volume of business permits.

Storage of Cheese Surplus

As yet the federation has not tried to hold over until winter the surplus cheese of spring and summer. First, it markets too small a fraction of the cheese of the state to be able to feed the market and thereby stabilize prices. In answer to the farmers' question, "Why doesn't the federation prevent low prices in summer?", there is but one answer. Before it can hope to do this, the federation must be large enough to keep the surplus cheese of the flush season off the speculator's market and hold it for the effective consumers' market during the following winter. That is, if farmers hope to do away with the drop in cheese prices that usually comes in summer, they must have a federation so large that it can prevent the temporary glutting of any market by holding the surplus cheese until win-

The Milk Can That Lasts

Sturges Milk Cans

ter before selling. A large part, or even all, of this surplus is being stored at present by private agencies. The farmers contend that there is manipulation to get this cheese at low prices. As a matter of fact, if prices were not relatively low these speculators would not buy cheese to be held over for winter sale. It is the great surplus during the flush producing season, out of all proportion to current use, which gives the speculator his chance. The only remedy worth considering by farmers is to retain ownership of the surplus until consumers need it. This in turn can be done only through a large, powerful federation which really feeds the market. At present the very lack of this organization makes it unavoidable for farmers to glut and starve the cheese markets periodically. For the same reason, the markets for other farm products are periodically either oversupplied or undersupplied.

Although the Cheese Federation, during its six and one-half years of operation, has not solved all the problems of cheese marketing, it has built a firm foundation for future growth. Similar early stages of growth must be passed through by any new federation designed to market other products.

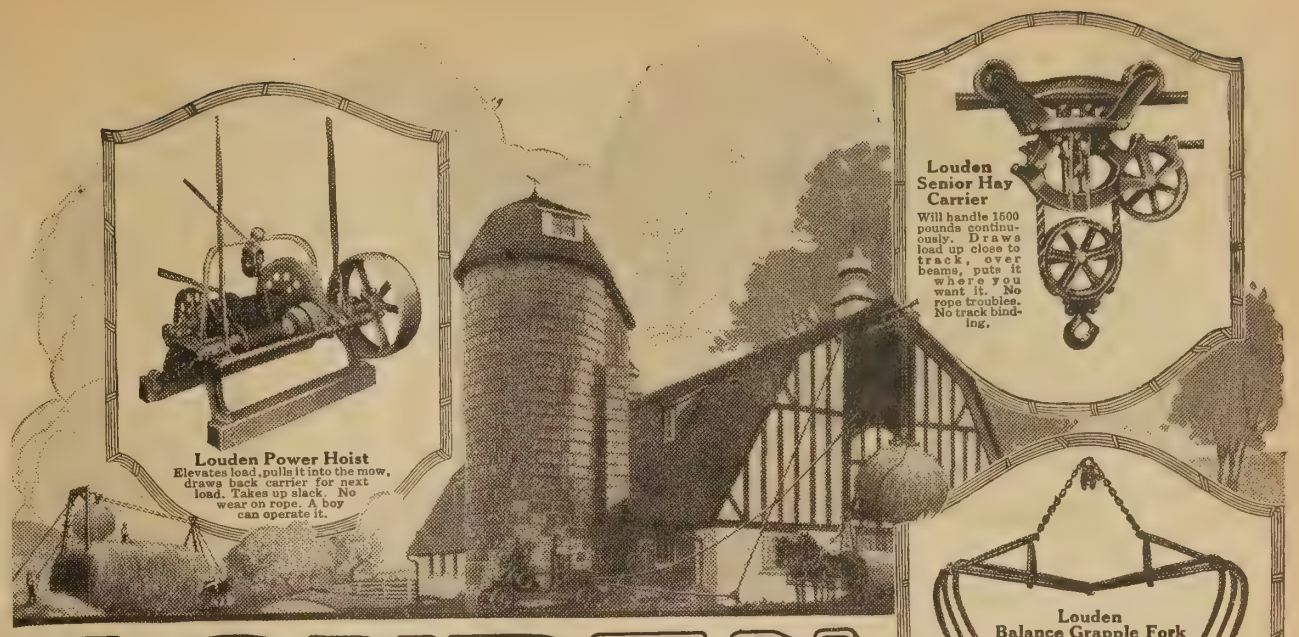
Steady Growth of Federation

When the federation started business on April 1st, 1914, cheese began coming in from 45 local cheese factories in and about Sheboygan County. During the first nine months of operation 6,125,480 pounds of cheese were received. The cheese producers marketed $855,328 worth of their product. During the following two years the federation held its own in spite of many difficulties; and in 1917 a period of substantial growth began.

Growth of Wisconsin Cheese Producers' Federation Shown by Quantity of Cheese Handled Each Year

Year	No. of factories	Lbs. cheese received from factories	Lbs. cheese received from factories each year for every 100 lbs. received in 1914
1914	45	6,125,480	100.0
1915	43	7,558,796	123.4
1916	45	7,490,020	122.3
1917	56	8,981,308	146.6
1918	63	8,522,509	139.1
1919	120	14,098,021	230.1

By 1919 the quantity of cheese handled had more than doubled while the value of the business had increased almost four times. The number of factories sending cheese had increased from 45 to 120. As the federation enlarged not only in the quantity and value of its products but in the number of counties from which cheese came, a warehouse at Spring Green was necessary. The largest of the 115 factories sending cheese to the federation in 1919 contributed 313,383 pounds, while the smallest sent only 4,514 pounds. These factories, averaging 121,070 pounds, marketed 13,923,000 pounds through the federation.



Distribution of Sales

When most of the business of the federation came from farmers in Sheboygan County, all of the cheese was assembled at the Plymouth warehouse. During 1919 less than two-fifths of the business, or 39.7 per cent, went to Plymouth from Sheboygan County farmers, while 46.4 per cent of the cheese went there from farmers in nine counties surrounding Sheboygan County. In the southwestern part of Wisconsin the farmers in four counties supplied 13.9 per cent of the cheese received by the federation. This was assembled at the Spring Green warehouse. As the expansion spreads to other parts of the state more warehouses will be operated to facilitate efficient paraffining and shipping of cheese. Both of the warehouses at present are managed by the federation. Cheese is shipped from them to various parts of the United States on orders given by the manager of cheese sales. During 1919 over 14 million pounds of cheese were sold in 37 states. More than 100,000 pounds were shipped to each of 22 states. It must be gratifying to these cheese producers to know that they are actually selling cheese through their own company, direct to distributing wholesalers and to retailers. In doing this they have built up a sound and independent mechanism. They have founded an organization which will bring fundamental improvements in the system of cheese marketing as soon as cheese producers expand it to state-wide importance.

Operating Costs Steadily Decreased

Farmers planning to establish other federations will find their greatest encouragement in the efficiency of this one. Being owned by farmers, the federation pays all its receipts, less expenses, to the account of the local cheese factories. The deduction for expenses has amounted

(Continued on page 513)

LOUDEN

Hay Unloading Equipment Saves Time—When You Need It Most

You have a valuable hay crop out in the field all ready to stack or house—a big rain is coming up—extra hands are on the ground to help out in the rush work. Every hour, more or less, makes or loses dollars.

These are the conditions Louden Hay Tools are built to meet. When you start Louden Hay Tools on any job you can depend on them to finish it—no delay—no running to town to replace broken parts. Every Louden Hay Tool is positively guaranteed that it is quality built, that it works easily, continuously, efficiently—that it will uphold every claim we make for it—and more.

William Louden invented the first hay carrier, Sept. 24, 1867. It made possible two story barns—larger hay crops, more profit.

Advantages That Distinguish Louden Hay Tools

It was over 53 years ago that the Louden Machinery Company made its first Hay Tools. All of these years of progress and development have perfected their simplicity, strength and dependable working efficiency—made them the recognized standard by hay growers everywhere.

Louden Balance Grapple Fork is the one fork which handles any kind of hay or fodder with equal efficiency—alfalfa, clover, cow peas, soy beans, corn fodder, straw, or long timothy. Lifts half a ton without straining, holds it tight without dribbling, drops it exactly where wanted, well spread out, saving half the labor of mowing back. Its perfect balance makes it easy to handle—ask the man who owns a Louden.

Louden Senior Hay Carrier enables you to store tons more hay in the mow, because it draws its load close up to the rack and over beams. Swivel rope clamp prevents rope troubles; never fails to register regardless of angle the load is lifted from; no bintling on track; easy on draft rope.

Louden Power Hoist makes good at any job of heavy lifting on the farm. Can be used with all Louden Hay Tools. Saves man and team at unloading hay. Equally efficient for end or center lift barn, or for stacking in the field; one man on load, one man in the loft or on the stack, and a boy on the Power Hoist, handle more hay than five men in the old way.

Louden Hay Slings will take a whole load off the wagon at a single lift.

Store your hay quicker and at less cost. Louden Tools do the job without a hitch from start to finish, even in unskilled hands, because of their simple, strong, trouble-proof construction. They pay many times their cost every season.

Write for These Two Helpful Books

Get Our Big Catalog. Sent postpaid, no charge, no obligation. It shows Louden Hay Unloading Tools, Power Hoists, Stalls and Stanchions, Animal Pens, Manger Divisions, Feed and Litte Carriers, Water Bowls, Barn and Garage Door Hangers, Cupolas, Ventilators—"Everything for the Barn." Going to build or remodel a barn? We can save you a lot of trouble and money.

Louden Barn Plan Book shows scores of barns, is a complete guide on barn building; and Louden Barn Planning Experts will give you suggestions and preliminary plans to meet your particular requirements, if you will give us some idea of your needs, number and kind of stock you want to house, etc. No charge or obligation.

OAKES & BURGER CO.
(Established in 1873). Cattaraugus, New York

THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill

A year's supply of oil is sent with every Aermotor

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

Aermotor Towers are Towers of Strength

Association Notes

(Continued from page 490)

members. One member has installed individual drinking cups and is installing a litter carrier. Another member has fitted up his dairy and wash room with multiple steam jets for sterilizing cans, etc., and is putting extra windows in his cow barn for lighting purposes. One other has lighted his farm with the popular Delco-Lighting outfit. Seven cows are on official test this month.

Delaware County, Ohio—During February the price of milk ranged from $2 to $3.25 per cwt. for 4% test. Grain prices were: Corn, 60c per bushel; oats, 40c; bran, $38—$40 per ton; oil meal, $53; cottonseed meal, $45—$48. This month all members were feeding home-mixed rations. Four pure-bred sires were added to the association during the year. The association average on 236 cows was 6,866.9 lbs. milk containing 285.24 lbs. fat per cow for the year. Three herds averaged over 10,000 lbs. milk per cow. Ed. Slocum's herd of three registered Holsteins and one grade Jersey averaged 12,101.4 lbs. milk and 417.59 lbs. fat. W. W. Warren's seven registered and one grade Holsteins averaged 11,869.4 lbs. milk containing 371.56 lbs. fat; and W. P. Smart & Sons own 15 registered Holsteins and five grades which averaged 10,523.9 lbs. milk and 358.0 lbs. fat. Fifteen cows averaged over 400 lbs. fat and ten cows over 12,000 lbs. milk.

Webster County, Missouri—Skimmilk was figured worth 50c per cwt. during February when fed to hogs and calves. The creamery paid 40c per lb. for fat. Feeds are rated as follows: Cottonseed meal, $38 per ton; bran, $30; crushed oats, $38; crushed corn, $26; silage, $6; mixed hay, $17; alfalfa, $20.

Wilton, Wisconsin—During the association year beginning July 13, two scrub bulls were sold to the butcher. Nine pure-bred bulls of good breeding were purchased. Twenty-five cows were sold for beef. In February the creamery paid 53½c per lb. for fat. Feed prices are: Mixed hay, $20 per ton; alfalfa, $23.50; bran, $28; oil meal, $44; oats, 50c per bushel; corn, $1.20 per cwt.

Macoupin County, Illinois—Ten unprofitable cows were sent to the block in February. The average feed cost per 100 lbs. milk was $1.75. The average cow produced 67c worth of milk and her feed cost 43c, leaving a profit over feed cost of 24c per cow. One member has purchased a pure-bred sire. Market milk testing 3.5% sold for $2.72 per cwt. and 3c per point above. Milk retails for 14c per quart. Feed prices are: Alfalfa, $30 per ton; clover hay, $25; oat hay, $18; silage, $7; corn, 70c per bushel; oats, 50c; bran, $1.50 per cwt.; hominy feed, $1.50; linseed oil meal, $2.80; cottonseed meal, $2; barley feed, $2.25; malt, $2.40; Purina Cow Chow, 3; molasses feed, $2.40.

Rogue River, Oregon—During the first year of association work, 67 unprofitable cows were weeded out. In February the creamery paid 44—55c for sweet cream and 39—49c for sour cream. Farm bureau grain mixture, "Milk Make", sold for $51 per ton and alfalfa hay, $16 to $20 per ton.

Snohomish Valley, Washington—In making out reports for the two associations in Snohomish County (Snohomish Valley and Stillaguamish Valley), the herds have been divided into two classes—Class 1 including herds of 15 or more milking cows and Class II including herds of less than 15 milking cows. The reason for this is that many times a member with a few cows can remain at the head of

the association and still not be the best dairyman. February market milk testing 3.8% sold for 2.75 per cwt. and 6c per point above. The condensery also paid this price for milk. Butter retails for 55c per lb. and milk for 11c per quart.

Coquille-Myrtle Point No. 2, Oregon—During the year ended February 1, 1921, the 549 cows completing their records averaged 5,391 lbs. milk containing 267.55 lbs. fat. Nine cows produced over 400 lbs. fat. W. E. Cross owns the highest fat producer with a record of 575.18 lbs. fat and 9,371 lbs. milk; he also owns the cow with the highest milk record for the year, 10,245 lbs. milk containing 533.66 lbs. fat.

Ten Years a Tester

A close study of herd improvement work covering a period of ten years has shown us clearly that, when properly conducted, the work of a cow testing association benefits people mentally, morally, and financially. A proper understanding of the work on the part of the members has proven this claim to be true in hundreds of instances. Hundreds of successful dairy farmers in Wisconsin and other states take a just pride in referring back to the time that they first joined an association.

Usually it takes only a few months' work to create within the new member a strong desire to own a higher producing herd of cows, and when one begins to study along these lines in most cases he or she is sure to develop a wider vision, a broader mind, better judgment, which means a better farm home equipped with the comforts of life and a better citizen.—FRANK LYNN, Tester, Wisconsin.

Profit From Testing

(Actual Experience by a Virginia Tester)

The tester of a cow testing association meets with many interesting experiences. He has many hard problems to solve, and quite a few people to keep in a good humor before he can call his work a success. The following account of one of his experiences in the Prince William Association by Mr. Scott, the tester, is instructive:

"When I came to the farm of Mr. A. who owned a herd of 25 cows and has another man running it for him, I found that which is generally expected, a low producing herd of cows. Mr. A. and I had quite a little talk together and he told me he was expecting me to make suggestions that would bring the herd up to the point where seventy gallons of milk a day could be shipped. At that time from the entire herd of 25 cows they were only shipping 40 gallons of milk per day. Mr. A.'s request was reasonable but as you know I can only advise a man and then it's up to him. However, Mr. A. assured me of his co-operation in carrying out my suggestions.

"After weighing the milk each cow gave and the feed she was given, I tested the sample of milk from each cow that I had saved and worked up the records so I could easily see in black and white just what each cow was doing. I saw several changes that would bring results, but, as you know, no matter how good a cow is she can't produce milk without feed, and it is lots better if it is the right kind offered. So I recommended a change in the kind of feed, that is, I gave him a balanced ration. Some cows are just like some people, they require more feed than others, but it is a safe way to feed 1 lb. of grain to each 3½ lbs. of milk, provided the cow gets all the roughage, such as silage and hay, she wants. So I made a list of the cows and the amount of feed each should have, thereby cutting down the feed where it was not needed, and giving more to those that did need it. That is, I suggested that each cow be fed according to what she produces.

"I then explained my suggestions fully, how they could best be carried out, and started out for the next place.

"When I came the next month I found that Mr. A. was shipping 50 and 55 gallons of milk, a gain of between 10 and 15 gallons, which was worth about 45c a gallon, or between $4.50 and $6.75 per day. You see that figures into money mighty fast so Mr. A. seemed very much pleased indeed with the association.

"Since then the cows have been steadily increasing until now Mr. A. is shipping 75 gallons of milk a day. The Virginia—Maryland Milk Producers' Association paid 36c a gallon for milk in January, so if we figure the actual returns in dollars and cents for the month of January it means $12.60 per day, or $390 for the entire month.

"Mr. A. is very enthusiastic about the association. It charges him less than $50 dues for the entire year and he thinks that before spring he will be getting over 100 gallons of milk per day. This increase was made from the same cows. It is true that three of these cows have freshened since I began testing, but three others have gone dry, and five others will soon be dry. So you see the increase is mainly due to feeding a balanced ration in the proper way, and the real results are really greater than they seem for it is especially hard to bring a cow back in her flow of milk after she is allowed to fall off."

Take Pride in Your Barn—Make Real Profit Out of It

You wouldn't bind wheat by hand in these days of labor saving machinery. Then why do you house valuable dairy cows in wet, dirty, old-fashioned stables and expect to get the most out of them?

No matter how few or how many cows you own, STAR Equipment will make money for you by cutting labor costs, helping herd health and increasing the milk yield.

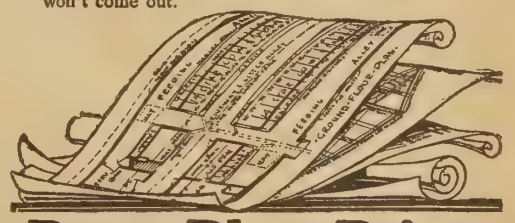
Any modern equipment is good, but numerous patented features put STAR in a class by itself. The Star Unit System permits you to add stalls as you buy more cows. The Curb Clamp cuts installation cost—the Alignment Device saves work—these are a few of many Star exclusive features. Investigate for the sake of owning a barn you can be proud of, both from a standpoint of "looks" and profit

The Star Line is not confined to Steel Stalls, Stanchions, Water Bowls, Pens, Ventilation Fixtures, Litter and Feed Carriers, but also embodies Harvester Hay Tools, Cannon Ball Door Hangers, Hoghouse Equipment, Garage Door Fixtures and all kinds of farm specialties. It takes a 320-page catalog to tell the Star story.

Your name will bring the finest catalog ever issued—a 320-page bound book worth owning for the useful information it contains. The only expense to you is the trouble it takes to write

Hunt, Helm, Ferris & Co.
Everything for the Modern Barn
Harvard, Illinois **Albany, New York**

STAR Equipment



1 Star Alignment Device
Instantly lines cow at gutter after she is in stall—keeps stall, bedding and cow clean.

2 Star Stanchion Adjustment
Narrows or widens stanchions to exactly fit cow's neck. Safety and comfort.

3—Star Curb Clamp
"Sets a stall in 60 seconds"—permits of concrete work being finished before stalls are set Cuts time of installation in half.

4—Star Unit System Stall
Each stall assembled before shipment, ready to go in place the moment it arrives.

5—Star Wood Lining
Hard maple lining forced in U bar, anchored so it won't come out.

Barn Blue Prints Worth $10.00 FREE!

Made Especially for Your Needs

Just specify on the coupon below the number of cows, young stock and horses you want to house and the experts in our Plan Department will send you a practical blue print of elevation, floor plan and outside of a barn especially suited to your requirements. And it doesn't cost you a cent. This is our "get acquainted" offer. Mail this coupon. We'll mail the plans free.

EDITORIAL COMMENT

THE food product inspectors of the Bureau of Markets, United States Department of Agriculture, suggest that every churning of butter be numbered. There is often wide variation in the scores of a shipment of butter and unless there is some way of picking out the different churnings, there is a loss to the creamery manufacturing the butter, as it is too much work to score every tub. There is such a wide difference in price between butter scoring 86 and 92 and over, that it is well worth while for the creameries to follow the suggestion made by the Bureau of Markets. It would be still better for a creamery to manufacture no butter scoring less than 92 points, but since some creameries do manufacture butter scoring less, it would be well to number each churning.

EXPERIMENTS at the Wisconsin Station have shown that some forages contain so little calcium as not to provide for successful nutrition. It has been found that hays grown on marsh lands vary widely in their content of lime, whether the soil is acid or alkaline. Blue grass grown on acid soil may have as little as .3% of calcium while that grown on an alkaline soil may contain twice as much. Cows with calf were fed very satisfactorily with marsh hays, grown on the University marsh, containing one per cent of calcium oxide, the cows dropping normal offspring of good weight and vigor. Timothy hay which was grown on this marsh was also high in calcium and also gave good results as a feed for pregnant animals. The conclusions of the station indicate that such roughages when grown on alkaline soil and fed dry are efficient for reproduction. Animals which are in heavy milk flow, however, will not be so successfully nourished on such roughages as with dried alfalfa or dried clover hay. At one of the substations, hay from an acid marsh has given trouble with reproducing animals. Analyses of samples of these acid marsh hays have shown that they are not sufficiently high in their calcium content to permit successful reproduction.

CHEER UP

The increased demand for grades throughout the dairy sections and the high prices being paid for them shows conclusively that dairy conditions are improving. We find upon investigation among the dealers in grade cattle and farmers who have them for sale that inquiries are coming from various sections of the United States for grade cattle. Last week 48 head of grades, most of them cows, sold in Minnesota for an average price of $168. This is a good price for grades and is somewhat out of proportion to the price for which pure-breds are selling. It may be also stated that there is a larger demand now for pure-bred cattle than there has been in the past few months, and it is our belief that those who desire pure-bred cattle in the near future should purchase them now. We do not believe they will be cheaper. There is a much brighter outlook for dairying at present than there has been in the past few months. When it is considered that the dairy industry has not suffered as much as other branches of agriculture, this indeed should be very reassuring and encouraging as to its future prospects.

EAT MORE MILK

One of our subscribers has written to us as follows: "I would like to have you write a good argument against farmers using so-called dairy substitutes. First, touch on the fact that less milk and butter are used in the country than in the city. Touch upon the farmers buying so-called substitutes and thus undermining their own industry and also injuring their children. Then upon the fact that the manufactures of so-called dairy substitutes are working continuously and in various ways to inform the consumer of their products."

Surveys made regarding the relative consumption of milk in the cities and in the country show that less milk is consumed in rural communities than in the cities. This is not a comforting fact, for the people who produce milk should consume more of it than those in the city. The growing child of the country needs milk just as much as the growing child of the city. Further, the people who produce milk set a poor example for the consumer of the city when they do not consume their own product. If the dairy farmer will not consume his products liberally, or if he holds that they are too expensive, how can he reasonably expect the city consumer to purchase dairy products?

More effort should be made to reveal to the consumer the food value and importance of dairy products. We should not let the manufacturers of so-called dairy substitutes continue their statements and have nothing to say about the superiority of dairy products.

GOOD CATTLE AND HONESTY

Those who have bred good cattle, have dealt squarely with their customers, and have advertised judiciously are enjoying good sales of their young and surplus stock. It is a well known fact that any business built upon the proper basis suffers less through a period of depression than one which has not been built upon a sound basis. The breeding of pure-bred live stock is no exception to this rule. It is generally held, by those well informed upon the value of good pure-bred animals, that it would be unwise for any breeder to sacrifice good cattle, for there is always a large demand for them. Every business is subject to temporary depression, but the serviceable enterprise suffers least and for the shortest while. The prices of live stock have gone down, but dairy cattle properly developed and owned by reliable, trusty breeders are now finding a better demand than was experienced several months back. It may be said that inquiries are coming from various sections for good grade cattle. This indicates that the demand for cattle will be much larger than it has been and that we may look forward to a steady improvement.

This is a most advantageous time to secure foundation stock as we do not expect to see prices cheaper. Good stuff, owned by men who take pride in furnishing their customers with capable, clean cattle, has not declined in price as has the poorer quality sold by men who have not been careful in the selection of their animals or exercised the responsibility they should toward their purchasers. This situation shows that it pays to breed good cattle and to sell no animal unless it is sound in every particular. Being honest and reliable is a business asset.

VALUE OF CO-OPERATIVE MARKETING

Those earnestly striving to bring about a more economical system of handling farm commodities may not be able to reduce the cost of marketing that is hoped for by some, but they will gather information which will be quite as valuable to those concerned. Lack of understanding and ignorance of factors influencing marketing conditions often lead to dissatisfaction and false conclusions. This is bad and does not solve or improve our marketing system.

In the study of the grain market fluctuations, Mr. C. H. Gustafson, chairman of the Grain Marketing Committee of 17, found wide variation in prices and cannot account for them unless there has been arbitrary manipulation of prices. He states that two years ago South America shipped corn to the United States and when it started for this country the price of corn in Chicago was $1.50 per bushel, but it immediately declined to $1.00 per bushel. Then before the next year's crop was produced this same corn went up to $2.00 per bushel. The price of corn went down from $1.50 to $1.00 and then up to $2.00 without any corn being produced. Mr. Gustafson has come to believe that there must be something fundamentally wrong with a price-fixing machine that functions in that manner.

We have pointed out many times the advantage of dairy farmers marketing their products co-operatively. It will assure them a full market price for their products and it will also give them information regarding the factors which cause wide fluctuations in prices of farm products. There is perhaps no system of marketing that will prevent fluctuations in prices unless the system monopolizes a particular product, and this would be a wrong system. Farmers should proceed to perfect a system of co-operative marketing carried to such an extent that the men who produce farm products will be assured that prices are not being fixed arbitrarily by any body of men and that they may know they are receiving the market prices for their products. The information and satisfaction which can be obtained through co-operative marketing, even though it does not affect any saving or bring any larger returns to the farmer, will be worth all it costs in effort and in money. However, there is every reason to believe that co-operative marketing would also bring a financial return.

HOG CHOLERA SERUM

Since the discovery of hog cholera serum, the losses from hog cholera have been materially decreased. This has led many to believe that hog cholera serum is a curative agent but this a misconception of its purpose. Hog cholera serum is very largely a preventive. According to Farmers' Bulletin No. 834, published recently by the United States Department of Agriculture, the serum has some curative value but its chief purpose is to immunize the hogs; that is, place them in a physical condition so they will not contract cholera. It has been observed that hogs suffering in the early stages of cholera have gotten well after the administration of hog cholera serum but to rely upon serum for curing cholera will lead to heavy losses. It would be wise for hog raisers, if they find their herds suffering from disease they cannot diagnose, to employ a competent veterinarian because no time should be lost in the administration of hog cholera serum if the hogs are suffering from cholera.

It is well, too, for all hog raisers to remember that good sanitary conditions are preventive measures, although hogs kept under the best sanitary conditions may contract hog cholera. It is not the filth of the hog pen that produces hog cholera—it only provides favorable conditions for the rapid growth of the germ of the disease that may have been brought to the hog yard. Hog cholera is a germ disease, and hogs cannot have it unless this germ is present. It is economical to provide sanitary surroundings, especially concrete or board floor for feeding and clean sleeping quarters.

Those desiring detailed information regarding hog cholera serum, methods of inoculating swine, and general information concerning hog cholera, should obtain Farmers' Bulletin 834 from the Bureau of Animal Industry, U. S. Department of Agriculture, Washington, D. C.

MEAL FOR COW OR SOIL

What would the dairy farmers think if they were advised to use cottonseed meal as a fertilizer? If we were to suggest this method of keeping up the fertility of the land, we are sure most of our readers would question our sanity.

The dairy farmer gets the fertility to his soil by an indirect route. He first gives feed to the cow and then conserves her manure, but the southern farmer is directed by a reliable farm paper, "The Progressive Farmer", to use cottonseed meal as a fertilizer. The editor knows this method is not the best practice but he also appreciates that the farmers of the South do not have sufficient live stock to consume the amount of cottonseed meal

necessary for fertilizing their acres. He knows it is uneconomical to plow, harrow, and plant land low in available plant food, and that cottonseed meal applied to the soil will increase the production of that soil. How much better would the southern farmer be if he followed diversified farming and fed more of his by-products to his live stock rather than to use them directly as a fertilizer or to sell a good portion to the farmer of the North.

The South is suffering today from the single crop system, the same as many of the northern states suffered in years past, and as some are still suffering by raising very largely one kind of crop. The weakness and risk of the single crop system of farming is emphasized by our present conditions. The dairy farmer following diversification is weathering this period much better than any other class of farmer.

There could be no greater argument for the dairy cow than the stable conditions found where she is kept as compared with those where she is not kept. We do not believe any system of farming can be approved where as good feed as cottonseed meal is used directly for fertilizing the soil. It should first be fed to live stock and then the manure carefully conserved and applied to the land.

A Pasteurization Outfit—Clarification

What kind of an outfit should I use to pasteurize my product—200 to 300 gallons? Which system is the best to deliver pasteurized milk with a perfect cream line in the bottle and a natural fresh raw milk taste, to keep easily in clean, sterile condition and in good working order?

Have you any preference for a pasteurizing outfit for a small milk plant?

I have plenty of steam and mechanical refrigeration. Would you advise to use a clarifier or a filter for cleaning milk?

The proper outfitting for my plant, although small, is of vital importance to me.

Miles City, Mont. W. S.

The important results to be accomplished by pasteurization of market milk, besides the economy of pasteurization, are maintenance of the cream line, prevention of cooked taste, and high germ-killing efficiency. Temperatures above 150 to 160 degrees F., diminish the cream line and must therefor be avoided.

Flash pasteurization at 160 degrees F., or below, is not sufficient to secure the desired germ-killing efficiency. Such pasteurization would offer no guarantee of freedom of milk from germs of milk-born diseases, such as the germs of tuberculosis, typhoid fever, diphtheria, etc.

For these reasons, flash pasteurization in itself is inadequate. The milk must be held at the pasteurization temperature for a sufficient length of time to make possible maximum germ-killing efficiency. This, then, means that while the heating may be done by means of a flash pasteurizer or in a vat, the heating must be continued by the use of a retarder or a holding device.

For the pasteurization of a limited volume of milk, such as from two to three hundred gallons per day, the use of elaborate heating and holding devices is out of question from the standpoint of economy, both in initial cost and cost of operation. There are, however, available on the market some simple flash pasteurizers that may be used in connection with a retarder or a holder, such as a vat, with good results. In this case the pasteurizer should not be crowded too much as the cream line would be diminished and the product would take on a cooked taste. The heating should be controlled carefully so as to insure a sufficiently high temperature for maximum germ-killing efficiency, and in the use of the retarder and cooler the necessary precautions should be taken to prevent excessive recontamination.

For all practical purposes, however, the vat or holding process is the most dependable and most easily operated and controlled in the case of relatively small volumes of milk. In this process the milk is pasteurized, held, and cooled in one and the same vat equipped with a revolving coil.

The chief drawback of the flash pasteurization of milk lies in the relatively slow heating and cooling, owing to the necessity of keeping the heating medium at or below 160 degrees F. This process can be hastened by not depending on the self-circulating system for circulating the heating and cooling medium and by using the positive circulation system. In this system the hot water and the brine, respectively, are circulated through the coil by means of a pump. In this manner the media pass through the coil at maximum speed and keep the coil constantly filled with the hot water or brine, thus insuring maximum volume and rapidity of transmission of heat or cold.

There is another vat pasteurizer that lends itself well to the pasteurization of relatively small volumes of milk. This is a jacketed vat and in the jacket the hot water is sprayed against the heating surface near its top and runs down on the water side of the heating surface. The milk in this vat is agitated by mechanical paddles moving back and forth lengthwise in the vat. This is a very inexpensive equipment and those who have used it claim that very effective pasteurization is accomplished by its use. It is also easy to clean and to keep in sterile condition.

With reference to methods of mechanically purifying the milk I wish to state that either a filter or a clarifier may be used. The filter has the advantage of not causing the milk to foam, of not affecting the cream line, and of not removing from the milk elements which might be of value, such as leucocytes. On the other hand, the filter has the disadvantage of causing the milk to flow through the very material which you desire to have filtered out. The filters that have found most general use for this purpose are the quartz filters. Absorbent cotton filters also have been made use of in many instances.

The clarifier has the advantage of removing more completely anything of a slimy nature in the milk, but unless this work is done at the proper temperature it may cause the milk to foam profusely and therefore interfere with the ease of filling the milk into the milk bottles. Those who have had experience in the operation of clarifiers have found that the foaming is most troublesome with milk at temperatures below 60 degrees F., and above 100 degrees F., while at temperatures between 60 and 100 degrees F., the foaming is less intensive.

Great claims have been made in the past for these mechanical purifiers of milk, both the filtration and the use of the clarifier. In reality very little is accomplished by their use. Most of the foreign matter that has gone into the milk is present in solution, if it is at all soluble, and by the time the milk reaches these mechanical purifiers these impurities can no longer be removed by such mechanical means. Neither the filter nor the clarifier reduces the number of bacteria in the milk to any appreciable extent, nor do they make the milk keep better. Filtered or clarified milk sours as quickly as the same milk not so treated, nor do they affect the cream line either way to any appreciable extent. Whether or not the removal of the material, which is called slime and which is found in the bowl of the clarifier, makes the milk more or less wholesome, is a disputed question. In the case of gargety milk it would seem that it would improve the wholesomeness of the milk, otherwise it is doubtful that the removal of the slime (which may contain many valuable elements belonging to natural milk) really makes that milk more desirable from the standpoint of the welfare of the consumer.

Aside from the fact that the use of the clarifier furnishes an attractive and convincing sales argument, its only commercially valuable feature lies in the freedom of the milk from visible specks or sediment in the bottom of the milk bottle.

O. F. HUNZIKER.

Cheese Factory Refrigeration

Would like to have you give us some advice. We built our cheese factory last summer and run about two months last fall. We have had difficulty selling what cheese we did make. Would it pay to make Primost or whey cheese? What extra equipment would be needed?

We are planning on building an ice house for next summer but don't know just how large to build it. We expect to handle about 4,000 to 5,000 lbs. milk per day next summer. Would like to have some suggestion as to how large to build ice house and what sort of refrigeration is used in cheese factory.

Minnesota. RADIUM DAIRY ASS'N.

I judge that you had less than 4,000 lbs. of milk per day last summer, and if so the cost per pound of making cheese was higher than would be the case at a larger factory handling more milk. The total cost of making a pound of cheese in Wisconsin at present is about 4c a pound, including labor and supplies and everything.

If you can get plenty of cheap wood for fuel and especially if there is a demand for Primost in your neighborhood so that you could sell all you could make, it might pay to make Primost. This is done by boiling down the whey in a large iron pan which may be 8 or 10 feet in diameter and 2 feet deep with a double walled flat bottom, which is steam heated. The hood over the kettle carries off the steam from the boiling whey.

Most factories do not have any refrigeration, but ship the cheese out every week or twice a week to the buyer. Just as soon as the cheese is dry on the surface, it is boxed and shipped. If the factory is some distance from the buyer, so that the cheese is on the train for more than a day, it may be that the buyer will prefer to have you paraffine the cheese at the factory.

It is possible that if you have a pond or river nearby, you might cut ice in the winter and build an ice house next door to your curing room so that the cold air can circulate through the curing room. This plan is followed in a great many Canadian cheese factories where the curing room is kept cool, that is, at about 60° by this process. A thick wall separates the ice house from the curing room, but there are two holes cut in this wall—one near the floor and one near the ceiling. The ice is so placed that the air passing from the ceiling of the curing room through the opening in the wall is cooled by the ice and then enters the curing room again through the hole in the floor. Most of the factories in Wisconsin do not have cold storage but ship their cheese twice a week to the buyer.

A cheesemaker can safely handle 5,000 or 6,000 lbs. of milk a day when fully employed, and he expects to make about $150 a month even if you do not keep him busy, so that with only 4,000 lbs. of milk you would have to pay him a rather large price per pound for his labor. In addition to labor costing about 1c a pound for making, the supplies cost about 3c.

Wisconsin. J. L. SAMMIS.

Wooden Mangers

Will you kindly submit form of mangers to build in my dairy barn? I wish to construct them of wood. I have a cement floor that is perfectly level before the stanchions. I have plenty of room before the cows, with about ten to eleven feet from stanchions to wall. My barn is constructed for two rows of cows and I drive through with team to clean same. I wish plans for mangers that will be easily kept clean and still be able to feed each cow separate.

Franklinville, N. Y. F. P. G.

It would be next to impossible to construct wooden mangers that can be kept clean easily and that will prove economical in the long run. The solid type of manger will work very well except that these will always be difficult to clean. Self-dumping mangers built of wood are heavy to lift and will need frequent repair.

Wooden mangers of the same general type as concrete can be built with a partition that will swing forward or upward to allow sweeping out the manger and which may be let down when the cows are fed. A somewhat less convenient arrangement would be to put in sliding partitions between each cow and remove these when cleaning the manger.

We anticipate that galvanized iron mangers, such as manufactured by the barn equipment companies that advertise in our columns, will prove more satisfactory than wooden mangers, and would probably prove cheaper in the long run. If any reader has solved the problem of wooden mangers in a way satisfactory to him, we would be glad to have the description of his methods. At present we prefer the concrete manger with the steel division or so-called steel mangers.

Repairing Concrete Silo

Our concrete silos have become very porous and the juice leaks out badly. Besides this, sand comes loose on the inside and slides down with the corn. It looks as though it were slowly dissolving. What is the best preparation to put on the inside to plug the holes and prevent this deterioration?

Hollywood, Washington. H. C. S.

The concrete silo was evidently not properly erected; either not enough cement was used or it was of poor quality or the sand may not have been sharp and clean. From the description given, we apprehend that the best procedure will be to plaster the entire interior of the silo with a good cement mortar. The usual directions for plastering would be applicable, such as cleaning out all loose material, wetting the walls well and putting on a coat of the proper thickness. If the deterioration of the wall has not been as serious as we apprehend, possibly merely whitewashing the interior with cement and water will be sufficient. This cement should be mixed to the consistency of thick cream.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

June 9—Ayrshire Breeders' Association meets in Springfield, Mass. Secretary, J. G. Watson, Brandon, Vt.

Jersey Cattle Notes

For week ending March 18:

Number of animals registered: Bulls, 229; cows, 759; total, 988. Number of transfers recorded: Bulls, 170; cows, 507; total, 677.

Maybe you can't afford to keep a pure-bred bull, but you could co-operate in a neighborhood ownership and maintenance of one.

Second Brentwood National

164 Holsteins sell for $209,540. Pietertje Prospect Colantha goes for $27,100

NO single event of the year will do more to hearten breeders of pure-bred dairy cattle than the Second Brentwood National where 164 Holsteins sold March 29-30-31 for an average of $1,277. Staged in a season of depression when pessimism has laid hold of many breeders, it demonstrates that there is a healthy market for first quality animals. Not only the breeders of Holsteins but of the other breeds as well are obligated to Brentwood Farm for the proof it furnishes that good breeding stock is in demand at par.

⚜

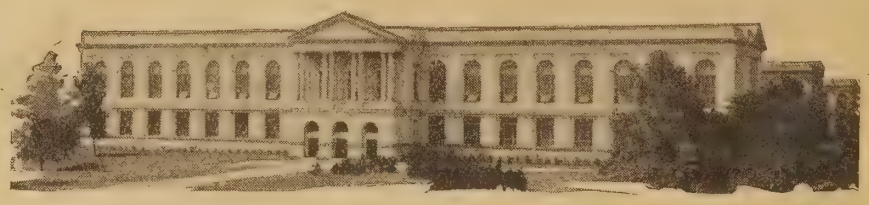
Chief interest centered about Pietertje Prospect Colantha, consigned by Carnation Stock Farms, and out of Segis Pietertje Prospect, world champion milk producer. The bid of $27,100, which made Huntington Valley Farm and Brentwood Farm his owners, was made after a three-cornered contest with Bell Farm and A. S. Deysher. This bull, in addition to his value because of a strong pedigree and his dam's phenomenal record of 37,381.4 lbs. milk, is of exceptional individuality. His photograph will appear in next week's issue.

The top priced female of the auction also came from Carnation Stock Farms, a two-year-old daughter of Matador Segis Walker bred to Carnation King Sylvia. She went to John Crozer of Pennsylvania for $5,500. An eleven-year-old cow, Katie Pietertje Paul 5th, consigned by J. Smith & Son of New York, was second high female, going to V. M. Montgomery of South Carolina and completing four generations in that herd. Bell Farm, Pennsylvania, paid Bridgford Holstein Co., California, $4,500 for Prilly Adirondac Dairy Maid, a yearling daughter of King Segis Alcartra Prilly and out of a 41.02-lb. cow, and sold Polly Douglas Fayne, a 32.47-lb. four-year-old, to C. W. Bray of Pennsylvania for $4,700. Bell Farm also purchased Maple Side Adelaide Walker, paying Rancocas Stock Farm of New Jersey $4,400 for this 31.68-lb. eight-year-old. The grand champion cow of the show, winner of the $1,000 prize, from Bell Farm, sold to Carl Schmidt of New Jersey for $4,050.

Sir Model Sylvia, the only other bull in the top ten animals, brought $4,500. E. Muirhead was the purchaser and A. C. Hardy the consignor, both of Canada.

Nooksack Jewel Fayne and a heifer calf by Ormsby Korndyke Lad each brought $4,000. The former was consigned by Herbert J. Evans, Washington, and sold to Maaikenshof, New York, and the latter, consigned by Walton Lake Farms, went to Julius Schmid, New York.

A more complete list of sales will appear next week.



⚜

A pleasing feature of the Brentwood Sale was the exhibition of animals for prizes totalling $2,600. W. S. Moscrip of Minnesota made the awards.

The grand champion cow was Gertrude Titania De Kol, the award being a prize of $1,000. Pietertje Prospect Colantha led the males and, as grand champion, won a $500 award.

Hazelwood Ormsby Posch owned by C. A. Harrison, Washington, won $200 as the best aged cow in milk. She sold to A. S. Deysher for $2,600. Allamuchy T A K Alice Wanda led the aged dry cows, receiving $200. She went to Cary Farm, Massachusetts, for $2,000. The best two-year-old in milk was Reformatory Hengerveld Fayne from Cary Farm. Mountain View Stock Farm, Maryland, later paid $1,100 for her. First Lady of Earl Crest, owned by Carnation Stock Farms, won first among the dry two-year-olds.

W. A. Woods of Pennsylvania showed a yearling heifer, Ormsby Nell Viola, which won in her class and made close competition in the championships. John Arfman led in the winning heifer calf.

COMMERCIAL MUSEUM, PHILADELPHIA, WHERE SECOND BRENTWOOD NATIONAL HOLSTEIN SALE WAS HELD

Holstein Activity in Kansas

HOARD'S DAIRYMAN:—Getting together for its annual meeting and sale at Topeka, March 25, the live Holstein-Friesian Association of Kansas laid plans for furthering its usefulness in promoting this breed and dairy interests generally. During the five years of this organization's existence it has made notable progress, taking an active and constructive part in the dairy affairs of the state. Its membership now consists of about 200 breeders. These men have been paying annual dues of $2 apiece, but the resulting fund was deemed insufficient for carrying on the work which the association's leaders felt that it should do. Accordingly the members voted at the recent meeting to increase the dues and to make other changes with a view to facilitating the work of the association.

Under the new plan the members will pay dues according to a sliding scale designed to cause the breeders to bear the expense of the organization in proportion to the number of pure-bred cattle owned and so in relation to the benefits received. Thus, members having fewer than 25 pure-breds over six months old will now pay dues of $5 a year; those having from 25 to 50 pure-breds will pay $10; from 50 to 75 head $15; while those having 75 head or more will pay $20.

Owing to the increasing number of Holstein breeders in every part of the state it was decided, in order to obtain better representation, to increase the board of directors from five to nine members. As the board is now constituted, therefore, J. P. Mast, G. Regier, and John Appleman hold terms of one year; Elmer Engle, Charles Schultz, and C. L. Goodin terms of two years; and Ira Romig, J. B. Fitch, and Major Harding Polk terms of three years.

Because of the difficulty in getting a large board of directors together quickly for the dispatch of urgent business, an executive committee of three members was determined upon, this to consist of the president, secretary, and one member chosen from the board of directors by that body. It was decided, too, to combine the positions of secretary-treasurer and sale manager, in which capacities W. H. Mott will serve the coming year. Walter A. Smith and Harry Mollhagen, respectively president and vice-president, were re-elected. To serve on the executive committee with Mr. Mott and Mr. Smith the board of directors chose Mr. Romig.

Throughout its existence the Holstein-Friesian Association of Kansas has taken a determined and advanced stand relative to tuberculosis, its members giving excellent co-operation to the federal accredited herd work in this state. Commenting on this co-operation and the fact that Kansas dairy herds now have a better health status than those of some other states where breeding stock is more frequently sought, Dr. H. M. Graefe, the federal inspector in charge, brought attention to the possibilities in continuing the tuberculosis eradication work in the state until it should be known as headquarters for healthy cattle. He also presented the question of the advisability of an official order requiring that all animals be certified as free of tuberculosis before they may be exhibited at public shows or sold in public sales. The association voted unanimously to support him in such a move.

In the association's consignment sale held the same day as the meeting, 81 head were sold at an average price of $204.04. This was about one-third less than the average price obtained in the association sale held at Topeka a year ago, when the average price of 133 animals was $321. The general downward trend of prices, of course, accounts for much of the difference. It was thought, however, that, though some excellent bargains were found in this year's sale, the standard of quality was not quite up to that of 1920; some of the breeders feeling that the market may soon turn for the better, and that there

Continued on page 511)

B. H. RAWL

B. H. Rawl, assistant chief of the Bureau of Animal Industry, United States Department of Agriculture, has resigned, effective April 30, to take charge of the educational work of the California Central Creameries. He will have headquarters in San Francisco. We shall say something about his work in our next week's issue.

Holstein Breeders' Sale

"The best cattle we ever sold" was the way the Holstein Breeders' Sale Co. of Central Wisconsin advertised their March 15—16 sale and such it proved to be. Those buyers who were at the Fond du Lac sale pavilion on those dates saw good cattle, and that they appreciated them is evidenced by the fact that the entire 142 head sold for an average of $323.

Fletcher Bros. were the heaviest consignors with their entire herd of 37 head. These brought $15,750, a good price considering the presence of several bulls in the consignment which were not as well received as they should have been.

The top figure for females was $1,100, three cows going for that price. Among them was Korndyke Queen Myrtle Segis, a 31-lb. 4-year-old granddaughter of Johanna McKinley Segis from the herd of Fletcher Bros. She was purchased by Carl Brugger, Wisconsin.

A 30-lb. 10-year-old daughter of that famous old cow, Jewel Duchess, also brought $1,100. She was consigned by W. W. Williams and purchased by C. A. Williams.

W. W. William's herd sire, a 31-lb. grandson of Spring Farm King Pontiac, brought the top price for males going to C. A. Williams for $1,000.

Perhaps no one animal of the sale aroused as much interest as 13-year-old Joe Oak De Kol Fobes, a grandson of Mooie Mutual De Kol and Homestead Jr. De Kol. He has for years seen service in the herds of Fletcher Bros. and S. M. Randall and today has a very creditable list of A. R. O. daughters to his credit. Coming into the ring at just a month less than 13 years of age he showed in a form that many a younger bull fails to equal and certainly proved a bargain at $500. He was purchased, on a wire bid, by Jno. A. Bell, Jr., of Pennsylvania.

Kelly, Mack, and Pohlman did the selling with F. H. Everson in the box. S. H. Bird managed the sale.

The following lists the animals selling for $300 or over and their buyers:

John A. Bell, Jr., Pennsylvania	
Joe Oak De Kol Fobes	$500
C. A. Williams, Wisconsin	
Ensign Pontiac The Great	$1000

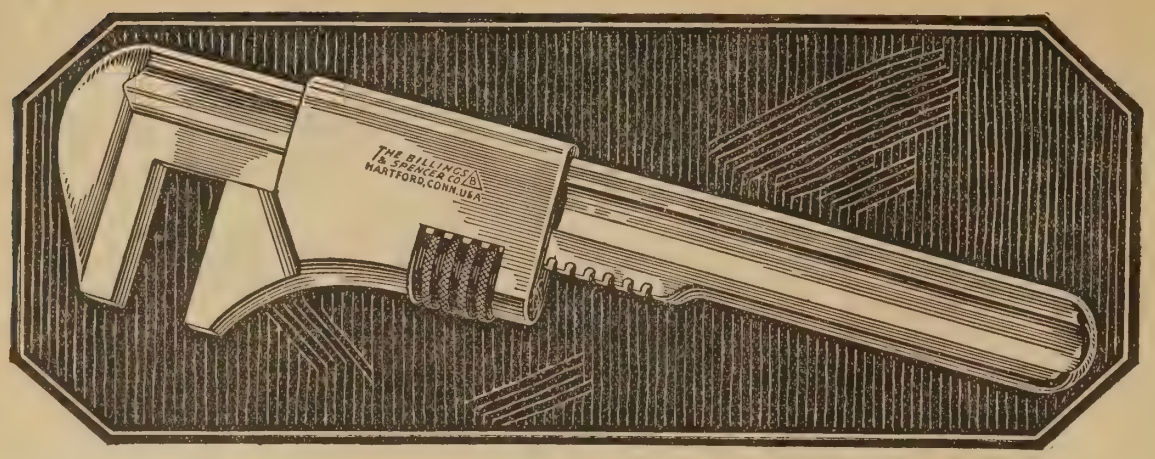
One to Five Ton Capacities



FEDERAL MOTOR TRUCK COMPANY

33 FEDERAL AVE. DETROIT, MICHIGAN

Federals in the Dairy Business

"The profitable marketing of dairy products depends upon motor transportation with Federal," — so writes H. Marks, of Waukesha, Wis. His route covers 36 miles with 47 stops. 22 miles of the road are unpaved, but every day, rain or shine, his two-ton Federal delivers from 75 to 85 cans of milk to the Gridley Dairy Co., of Milwaukee.

HORSE gang and tractor gang plows mean plenty of machinery to get out of order, unless nuts are kept tight by constant watchfulness and the accurate, steady, never-failing twist of Billings & Spencer wrenches.

The farmer knows a good tool when he sees one. At your hardware dealers.

"RELY B ON ME"

The BILLINGS & SPENCER CO.

HARTFORD, CONN.

Cow Waters Herself

with this wonderful new Libbey Automatic Water Bowl. Animal moves lever, opening water valve, when it starts to drink. Lever swings back, closing valve, when animal stops drinking.

15% More Milk

Milk is 87% water, and cows cannot give their greatest yield unless they have plenty of water constantly within reach. Farmers who use Libbey Bowls report an increase of 15% to 20%, which soon pays for the bowls.

Libbey Automatic Water Bowls

are the most sanitary and successful ever invented. Each bowl controls its own water supply, operated entirely by cow, and may be put at different heights, or in any stall or pen. No float tank required. Cannot overflow; cannot get out of order. Almost no water left in bowl to become stagnant. They save labor and feed and increase milk. Prevent spread of contagious diseases, as each cow has her own bowl and no water can pass from one to another, as with old-style bowls. Very simple and easy to install. Write for circular and prices, also FREE DAILY MILK AND FEED RECORD.

If interested in Stanchions, Stalls, Carriers, etc., ask for free General Catalog.

Demonstrations Convince

(Continued from page 489)

were watching the field were amused in an I-told-you-so attitude by not seeing a pronounced initial benefit from the lime. But their doubts were dispelled during May and June. The munificent rain, the warmth, and sunshine put an inch-a-day pep into the growth of healthy dark green alfalfa, save for the unlimed thirty-foot strip. It took sick. As one man told me, "It got the jaundice". At any rate, it stopped growing, turned yellow, began dropping its leaves, and you could see for a distance of a half mile, as plain as day, that miserable failure through the center of an otherwise splendid field. Well, here was a chance to show what lime would do—to let lime speak for itself, and to put dollars and sense punch into the lime campaign. A field meeting was called. Some 75 farmers attended. There was a brief program before the alfalfa was inspected, at which the details of the trial were explained. The group was then led around the edge of the field where some plainly visible results with varieties could be observed without distraction by showing up the lime results. When the crowd reached the lower end of the field, the sudden view of the outstanding benefit of lime for alfalfa on that field convinced the most skeptical—particularly those who had trouble growing alfalfa.

4,700 Tons of Ground Limestone Used; $12,000 Saved

Lime told its own story more effectively than words could describe. That short, sickly, yellow strip of "no-lime" alfalfa through the center of an otherwise splendid field brought more serious thought and discussion on the use of ground limestone than had ever obtained before. The iron was hot and it was time to strike.

Jim Lacey had previously located twenty splendid high testing limestone quarries. There was a good, well equipped limestone grinder which had been lying idle in the county for some time. Through the assistance of Arthur Preston, a prominent farmer who helped finance the deal, a cement contractor was induced to buy this outfit and go into the lime grinding business. Lacey helped him round up the orders, and the two and one-half years following the demonstration he (the lime grinder) ground 4,700 tons of limestone for Green County farmers, and the work is still going on. Think what this meant in the way of service to that community!

First of all, most of the farmers who had this limestone ground, lived four, five, and six miles from a railroad station. To have finely ground limestone shipped in it would have cost around three dollars a ton at the track. The uncertainty of railroad service made it problematic as to the time of arrival of shipments. When they did arrive, regardless of how busy the farmers were with farm work, the limestone must be unloaded or else heavy demurrage paid. Then the time, labor, and expense of the long haul from station to farm and the rehandling, should fields not be ready for immediate application of the limestone. These were all factors which interfered with the previous use of lime. But with the enthusiasm developed at the demonstration, coupled with the possibility and convenience of getting limestone ground right on their farm or near at hand at a cost of about two dollars a ton, and where it could be hauled when the field was ready for the application without rehandling—with

previous obstacles eliminated, the limestone proposition was put across on a big scale, largely due to this alfalfa lime demonstration.

Considering all the items previously mentioned, there was a saving on this limestone laid down on the field, conservatively estimated, at from two to three dollars a ton or a total of about $12,000.00. Of course, this is but a drop in the bucket compared with the long time results and increased feed production and economy of production effected by the use of 4,700 tons of ground limestone.

It is not the purpose of this illustration to suggest the limestone grinding idea only under those special circumstances where it is advisable and practical, but it is the object of this incident in agricultural progress to show the true value of demonstrations in "delivering the goods" agriculturally on a wholesale basis.

Summary of Census of Holstein-Friesian Cattle

The Holstein-Friesian Association of America over a year ago decided to determine how many pure-bred animals and breeders there are in the United States. This work has been completed and the following is a summary of the census of Holstein-Friesian cattle:

Government Issues Farmers' Almanac

"Beware of false prophets. Don't plant by the moon; but get the best seed and prepare the seed bed, then plant when soil and moisture conditions are right." "Keeping farm accounts never worried Adam; but he was only a gardener." "The owner of a scrub bull should have a leather medal—made from the bull's hide." These bits of farm advice are contained in "An Agricultural Almanac for 1921" issued by the United States Dept. of Agriculture to remind farmers to do the right thing at the right time and to tell them where to secure information on agricultural subjects.

The almanac, which appears as Farmers' Bulletin 1202, is published, the Department says, in response to a large demand from farmers for a calendar of work showing the timely use of new farm facts. Seasonal advice and suggestions are given on such topics as the weather, farm plans, fruit, live stock, poultry, farm operations, marketing, wild life and woods work. References to other publications of the department tell where detailed information on each subject can be had.

A section on "Farm Helps" discusses farm laws and gives tables and directions for such things as mixing stock feed, fertilizers, and spray solutions; weights of seed and grain, and other information needed by farmers and their families. A limited number of copies is available for distribution by the United Stats Department of Agriculture, Washington, D. C., and may be had upon application.

Waupaca County Holsteins to Nebraska

HOARD'S DAIRYMAN:—During the past month M. N. Lawritson, Dairy Extension Specialist of the Nebraska College of Agriculture, selected two carloads of grade cows in Waupaca Co., Wisconsin, for shipments to Nebraska. The buyers were attracted to Waupaca Co. by Holstein Association advertising and the prices received bear testimony to the value of a breeders' association when it is properly used. The only charges to the members of the Holstein Association was the regular 2 per cent commission taken by the association to pay advertising and for correspondence expenses.

The first carload shipped went to Hastings, Nebraska, where the animals are being passed on to the farmers at cost through the First National Bank of that city. The 16 head cost them $1,750, or an average of about $110 per head including five two-year-old heifers. The second carload of 20 head cost them $2,385, or an average of about $112 per head. They were shipped to a large mercantile company at Lincoln and are to be used to supply milk for a large restaurant.

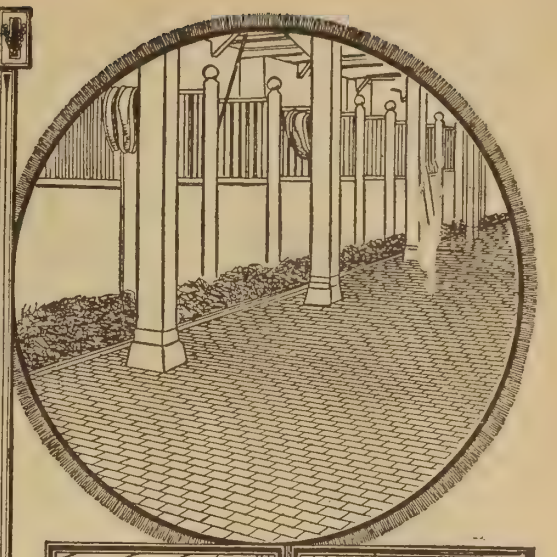
Durable, Safe, Sanitary Floors For Farm Buildings

LONG-BELL Creosoted Yellow Pine Blocks solve rightly and for all time, the important problem of floor construction in barns, dairies and stock and poultry houses. Such floors are unusually durable, safe and sanitary. They provide the utmost comfort and convenience and are most economical.

LONG-BELL
Creosoted Yellow Pine Blocks

Floors made of these blocks are firm, yet resilient; smooth, even and dry; easily kept clean. There is no danger of warped surface or splinters to injure stock. They are warm in winter and cool in summer. Cost least in the long run.

Long-Bell Creosoted Yellow Pine Blocks are given long life and made to resist decay, fire and other destructive elements by a thorough injection of Creosote (Dead Oil of Coal Tar) by the pressure-vacuum process. Thus preserved, they remain firm and dependable for many years without replacements or repairs.



Look for the L-B Trade Mark in the Circle!

Cut the Cost of Milking And preserve your profits

LET one man do the milking that three men did before and you'll make more money even in times when the other fellow is finding it hard to "break-even."

Hand milking always has been wasteful—always has been slavish drudgery—never has been natural. Nature intended milk to be suckled out like a calf does it and that's the way a Sharples works.

No other milker has a positive squeeze. No other milker even squeezes the teats out of round. No other milker uses compressed air. Sharples patents protect this absolutely.

Most cows give down more milk to the gentle comfortable Sharples suckling action than they do to hand milking. They like it and it increases the milk yield.

The Sharples is made in two types. Our Pipe Line Milker (for large or small dairies) is now in satisfactory use on over one million cows and is to be found in nearly every country in the world. Our new Moto Milker is an electric, portable milker made especially for six to twenty cow dairies that have electricity. No installation is necessary—simply wheel it in the barn and milk. It will run from a farm lighting plant. Both machines have the same gentle suckling action on the teats and the intermittent squeezing by Compressed Air (patented).

A Sharples will cut your milking costs and increase your profits from the start. Let us send you our descriptive booklet. Sent free.

DAIRY MARKET NEWS

Cheese Markets Lack Steadiness

[Report by U. S. Bureau of Markets.]

Dullness in cheese markets the previous week developed into weakness during the week ending March 26th. Reports from all sources, both wholesale and distributing markets, and primary country markets in Wisconsin indicated that buying was practically at a standstill, and that goods were not moving at current asking prices. Receipts of fresh cheese were irregular, being only about sufficient at eastern markets to take care of a limited demand, but heavy enough at Chicago to accumulate considerable stocks.

Following the drop at Plymouth on March 21, which averaged about 2c on different styles, business at Wisconsin primary markets was even less satisfactory than the previous week. Some dealers report the markets there as almost demoralized, and state that southern distributors are not buying at any price. This is due partly to anticipation of lower markets, and also to generally discouraging business conditions. Other Wisconsin dealers report practically no sales, but that some cheese has been shipped on consignment.

The average wholesale prices on American cheese (style Twins) for the week ending March 26, 1921, and for the corresponding week a year ago, were as follows:

	Week ending March 26 1921	1920
	cents	cents
New York	27.7	29.2
Chicago	23.2	28.9
Boston	24.6	30.5
San Francisco	22.9	27.9
Wisconsin	23.1	29.0

The total receipts of American cheese at these markets were 2,924,420 lbs. as compared with 3,158,286 lbs. a year ago, and 2,533,940 lbs. a week ago.

Butter Markets Steady

(Report by U. S. Bureau of Markets)

The supply of fresh butter during the week ending March 26 was just light enough to stop the recent price slump and to hold the market fairly steady. Domestic receipts on the four markets were slightly heavier than during the previous week, but no new Danish cargoes arrived at New York and buying of butter was on a little broader scale.

Advices from New York during the week frequently mentioned 93 score and even 94 score Danish. Some of the lots are said to have scored 95. This is rather a remarkable showing and in the face of considerable complaint heard on the markets about poor lots of domestic makes, the competition appears all the more serious. Danish butter was reported as being offered and well received on Boston and Philadelphia markets. Philadelphia has heretofore found little favor for it. Some of the last shipment was in 56-lb. boxes, a fairly saleable package. Of course, it must be remembered in connection with our recent domestic make, that cream producers have not as yet adjusted themselves to the unusually warm weather this season. There was a real scarcity during the past week of butter scoring around 89 to 90, especially on Eastern markets. Sale of storage was further crippled by the liberal offerings of Danish.

Pacific Coast markets have declined considerably; San Francisco reported as low as 36c. So far, but little butter has been sold for shipment east. The Chicago market is the only other market which showed a decline for the week. At the close there was but little change in tone, possibly little more firmness on the surface but with the undertone still weak and unsettled.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending March 26, 1921, and the corresponding week a year ago were as follows:

	Week ending March 26 1921	1920
	Cents	Cents
New York	46.2	67.7
Chicago	45.0	65.3
Philadelphia	47.0	68.7
Boston	46.3	69.0
San Francisco	35.5	59.0

The receipts of butter at these markets were 8,414,686 lbs. as compared with 8,248,189 lbs. a year ago and 7,777,231 lbs. a week ago.

New York Butter Market

NEW YORK CITY, MARCH 29:—Constant changes in butter prices are inevitable because of the very sensitive condition which prevails in the market at all times. There is a very large consumptive demand at present and domestic receipts are moderate, a condition which favors a firm, steady market ordinarily. However, heavy receipts of foreign butter constantly tend to keep the market in a state of turmoil and there is no method whereby future developments, even but a few hours off, can be forecasted as marked periods of weakness or strength develop unexpectedly. The foreign butter is quite welcome in the market at the present time as the domestic supply would be insufficient to supply the demand. Market conditions are singularly peculiar at present as even during times of apparent weakness practically all the butter that arrives leaves the receiver's hands shortly after delivery.

The long expected Oscar II reached port Saturday and its cargo of Danish butter, consisting of 18,865 casks and 468 boxes, aggregating more than 2 million pounds, was unloaded on Sunday and Monday. The availability of that butter was responsible for the price decline on Monday. However, the cost to the buyers was greater than could be realized for the butter on Monday which resulted in the butter being withdrawn from sale on that day. The result was that the supply of domestic butter was not sufficient to meet the demand and the price advanced today. The Danish butter is now moving freely at prices on a par with the quotation on extras.

Another boat, the United States, carrying a cargo of approximately 6,600 casks and boxes of Danish butter is expected the last part of the week. Following that, no more heavy shipments of Danish butter are expected because of the fact that France and England, particularly France, are now taking the greater part of the Danish surplus at prices which are higher than can be secured in this country. It was not expected that large

*Hay quotations represent average of cash sales at these markets. †Nominal.

Straw—Oat and wheat straw is in good request in Omaha. Oat straw is easier in Baltimore with other kinds steady and unchanged. In Chicago oat straw is scarce and wanted. Cincinnati dealers expect the usual good demand for rye straw next month when the horse racing season opens at Latonia, Ky. Quoted prices are: Wheat straw, $18 Philadelphia, $14.50 Baltimore, $15 Richmond, $15 Pittsburgh, $12.50 Chicago, $8 Omaha; oat straw—$18 Philadelphia, $16 Baltimore, $15 Pittsburgh, $13.50 Chicago, $8 Kansas City, $9 Omaha; rye straw—$20 New York, $19 Philadelphia, $17 Baltimore, $15.50 Pittsburgh, $14.50 Chicago.

shipments would be forthcoming during the coming summer months because of the scarcity of refrigeration space in boats plying between Denmark and this country. It is very probable that Danish butter receipts will be so small as to be almost negligible during the coming months. It is interesting to note the quantity of Danish butter that has been imported into this country since January 1. The total quantity marketed in this country since that time is 73,388 casks, 2,510 boxes, and 50 tubs aggregating 8,363,116 pounds Of that quantity 34,400 casks and 1,288 boxes, aggregating 4 million pounds, were received in March Other imports of foreign butter during the last three months approximate 1¼ million pounds, the origin of which was the countries of Holland, New Zealand, and Argentine. The quality of the Danish butter in the recent shipments has been excellent. None of it has scored lower than 93 points and the official inspection of large quantities of it showed some of the butter to score 95 points. It is not to be wondered at that the consumer is beginning to demand Danish butter.

Established quotations today are as follows: Extras (92 score), 45½@46c; higher scoring than extras (93 score), 46¼@47c; firsts (90—91 score), 44@45c; firsts (88—89 score), 42½@43½c; and seconds (83—87 score), 37@42c.

SHEBOYGAN FALLS, Wis., Mar. 29—On the Wisconsin cheese exchange at Plymouth on Monday twenty factories offered 2,876 boxes of cheese. All sold as follows: 100 boxes Twins at 19c; 50 boxes at 19½c; 1,100 boxes daisies at 20¾c; 400 boxes at 21c; 100 boxes at 21⅛c; 150 boxes Double Daisies at 20c; 100 boxes at 20¼c; 651 cases Longhorns at 21c; 325 boxes square prints at 21c. Compared with a week ago these prices show a sharp decline of 2¾c on Twins, 2½c on Daisies, 2¼c on Double Daisies, and 3c on Longhorns and squares.

Washington, D. C., Weekly News

[Special to Hoard's Dairyman.]

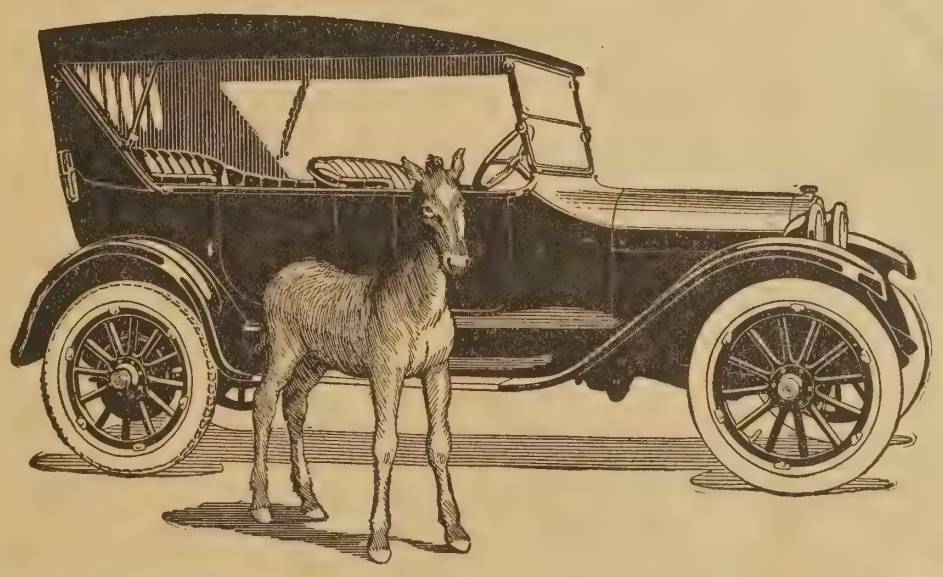
WASHINGTON, D. C., MARCH 28—Mr. Rawl, accompanied by Dr. C. W. Larson, now chief of the Dairy Division, has just returned from a trip to the demonstration farm of the Bureau of Animal Industry at Iberia, La. The "round-up" held there last week was a great success, they report, attended by many farmers and by extension workers, and the dairy and animal industry in general seems to be attracting much favorable attention in the section of which this is the center. They report especially the awakened interest in the Louisiana State College of Agriculture at Baton Rouge, supported by the Severance tax, which is providing much increased revenue, has already added a thousand-acre farm to the college equipment, and is planning new buildings, new courses, and generally increased efficiency and service.

No news yet of the neutralizer ruling. Neither is there any change yet as Commissioner of Internal Revenue, although the political gossips are busy with the place. There is some reason to believe that Secretary of the Treasury Mellon, who is the real power now in both matters, is likely to be so busy with those matters which involve the preparation and consideration of legislation on the prohibition, income tax, and other tax problems, that there is likely to be a continued delay of several weeks.

The gossips are busy with the appointments to be made of successors to Chief Alsberg of the Bureau of Chemistry of the Department of Agriculture, of a successor to Floyd H. Harrison, assistant to the secretary, and of the two new directors to be named effective July 1st, director of research, and director of administration. At this writing the situation, officially, is no appointment likely to fill the assistant to the secretary vacancy; no appointment decided on for Chief of Chemistry, but many applications received and all being given careful investigation; no decision on either directorship, but organizations interested being asked to submit recommendations for both positions and appointment not to be made until careful consideration has been given men for the positions.

The two weeks in April beginning April 11, are to be big weeks in Washington for agriculture. First of all, Congress meets and the president's first message will give the country his state of mind on many things, probably on the agricultural problems. Then the Farm Bureau Federation is to open a meeting that day on legislation, with representatives of all the state federations and the executive committee to be present. April 12 the officers and executive committee of the Milk Producers' Federation are to convene and April 13 the National Grange officers and executive committee meet. April 14, a conference of farmer organization leaders has been announced. The same day the representatives of the All-American Farmer Labor Co-operative organizations will meet at the LaFayette hotel. April 10 the Farmers' Union is to hold a mass meeting. And on the same day the representatives of the newly organized National Association of Farm Loan Associations meet for its first session, formal organization, election of officers, and to determine its legislative and administrative program.

DODGE BROTHERS
MOTOR CAR



In the estimation of many people, the reliability of Dodge Brothers Motor car is its most valuable quality

The knowledge that it can always be counted upon is worth fully as much as its low cost of daily operation and yearly maintenance

Wherever you live or wherever you go, you will find Dodge Brothers Motor Car has a reputation for satisfactory, low-cost service to its owners

The gasoline consumption is unusually low
The tire mileage is unusually high

DODGE BROTHERS, DETROIT

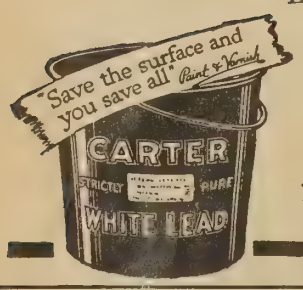
Different Again

Two darkies met on the street, and the following conversation took place:

"Is yo' all goin' to the pa'ty Sat'day night, Rastus?"

"I ain't says I ain't, is I?"

"Looky heah, nigger! Nobuddy ain't askin' yo' is yo' ain't—I'se askin' yo', is yo' is!—Ex.



Will you pay the painter ***now*** and ***keep*** your buildings new and sound and attractive to look at?

—or will you delay and then pay the carpenter to patch and mend those surfaces when they have been too long bared and exposed to rot and decay — BESIDES the cost of painting at THAT time?

Decide this question ***now—today***—and prepare to paint ***this Spring*** everything on your property that needs painting. Remember, money lost by damage to paint-worn lumber by sizzling heat and freezing cold ***cannot be recovered on any insurance policy.***

For the surest protection of your property and for greatest durability, use a strictly pure CARTER WHITE LEAD and OIL PAINT. Get this season's reduced prices on Carter White Lead, pure linseed oil, and turpentine (and colors, if you want colored paint), and figure the cost of painting. Compare this small sum with the replacement value of your buildings. You'll agree that the investment yields big returns in lumber insurance.

Carter White Lead

Any retailer who handles Carter White Lead can help you figure how much you will need and what it will cost. If there are any questions about paint or painting that he can't answer, write to our Paint Information Bureau.

How Gurnee Solved the Rural School Problem

(Continued from page 487)

use of a large wood working room, with 16 fully equipped carpenter's benches. Then, there is a blacksmith shop with six forges where the future farmers of Lake County are taught the rudiments of iron working. The subjects being studied here are naturally those arising out of agriculture itself.

The girls who study domestic science are just as fortunate as the boys. They have one of the most completely equipped kitchens in any high school in Illinois. They are taught cooking on modern electric ranges, and have the use of a most complete outfit of equipment, all of which is in keeping with the highest standards of this department. Here the future farm wives are taught food values, the proper selection of food, how to prepare balanced meals that are both satisfying and appetizing.

Last year, the Agenda Domestic Club began serving hot lunches intended merely to supplement the cold lunch brought from the farm home, for many of these students come from miles away, some driving automobiles, some with horses and buggies. This year, the lunch is organized on the cafeteria plan and a full meal is served with the aid of very little outside help.

This school gives opportunity for normal expression of all the normal, human instincts growing out of the desire for sociability, as well as meeting the mental and physical needs of the boys and girls enrolled as students.

Whoever heard of a country school athletic club? Yet, here we find one which is most successful, meeting with an average attendance of 25, once a week, playing basket ball, volley ball, and other games, in a gymnasium room which would do credit to a city of 10,000 people. When the principal, Mr. H. B. Henley, was asked if the young folks did not use this excellent gym floor a great deal for dancing, he replied: "Well, not as much as you might imagine. It is true a few of them like to dance once in a while, but we have so many other activities which they are so much more interested in that they don't seem to care very much for dancing. And it is the same with motion pictures. We have been thinking of installing a first class motion picture outfit in our auditorium, but we are not sure just yet that we want one. We could have one if we should simply say we wanted it, but our young folks, as well as the older ones, find so many other activities here and so many things to do they don't seem to have much interest either in dancing or motion pictures."

Can you read those words of Professor Henley without being struck with their significance? The pessimist who believes the country is going to the dogs because our young people can do nothing but dance or go to motion picture shows will at least see in this condition at Gurnee a ray of hope!

A group of about fifty men and women meet togther informally once a week to study community problems. Just now they are reading together "The Community Center". They have no real organization, but a community center organization undoubtedly will grow out of the activities of this club. The meetings are most informal, a prominent place being given to the social side, as well as to the refreshments, which usually form a part of the evening's attraction.

A "GYM" CLASS IN A GYMNASIUM ROOM WHICH WOULD DO CREDIT TO A CITY OF 10,000 PEOPLE

The school and those interested in the community provide an annual lyceum course of at least five numbers which is conducted with great success. Occasionally an evening is given over in part to community singing under the leadership of a competent director.

The school auditorium is provided with a stage sufficiently large and with the kind of scenery which lends itself to the production of home talent plays and entertainments open to the public and thoroughly enjoyed. There is an occasional banquet put on by the Agenda Club and the Ag Club, at frequent intervals there is a social for the young people, and literary programs are given in the high school every two weeks on Friday afternoon, to which the public is always

COMPLETE EQUIPMENT FOR MANUAL TRAINING

welcome, and the number of visitors is usually large.

Real extension work is being planned by Professor Henley and the Board of Education, which means that some of the good things enjoyed by the school itself in Gurnee will be taken to some of the outlying points of the country, resulting both in a more intelligent interest in rural problems in the points visited, as well as a greater appreciation of and interest in the consolidated high school.

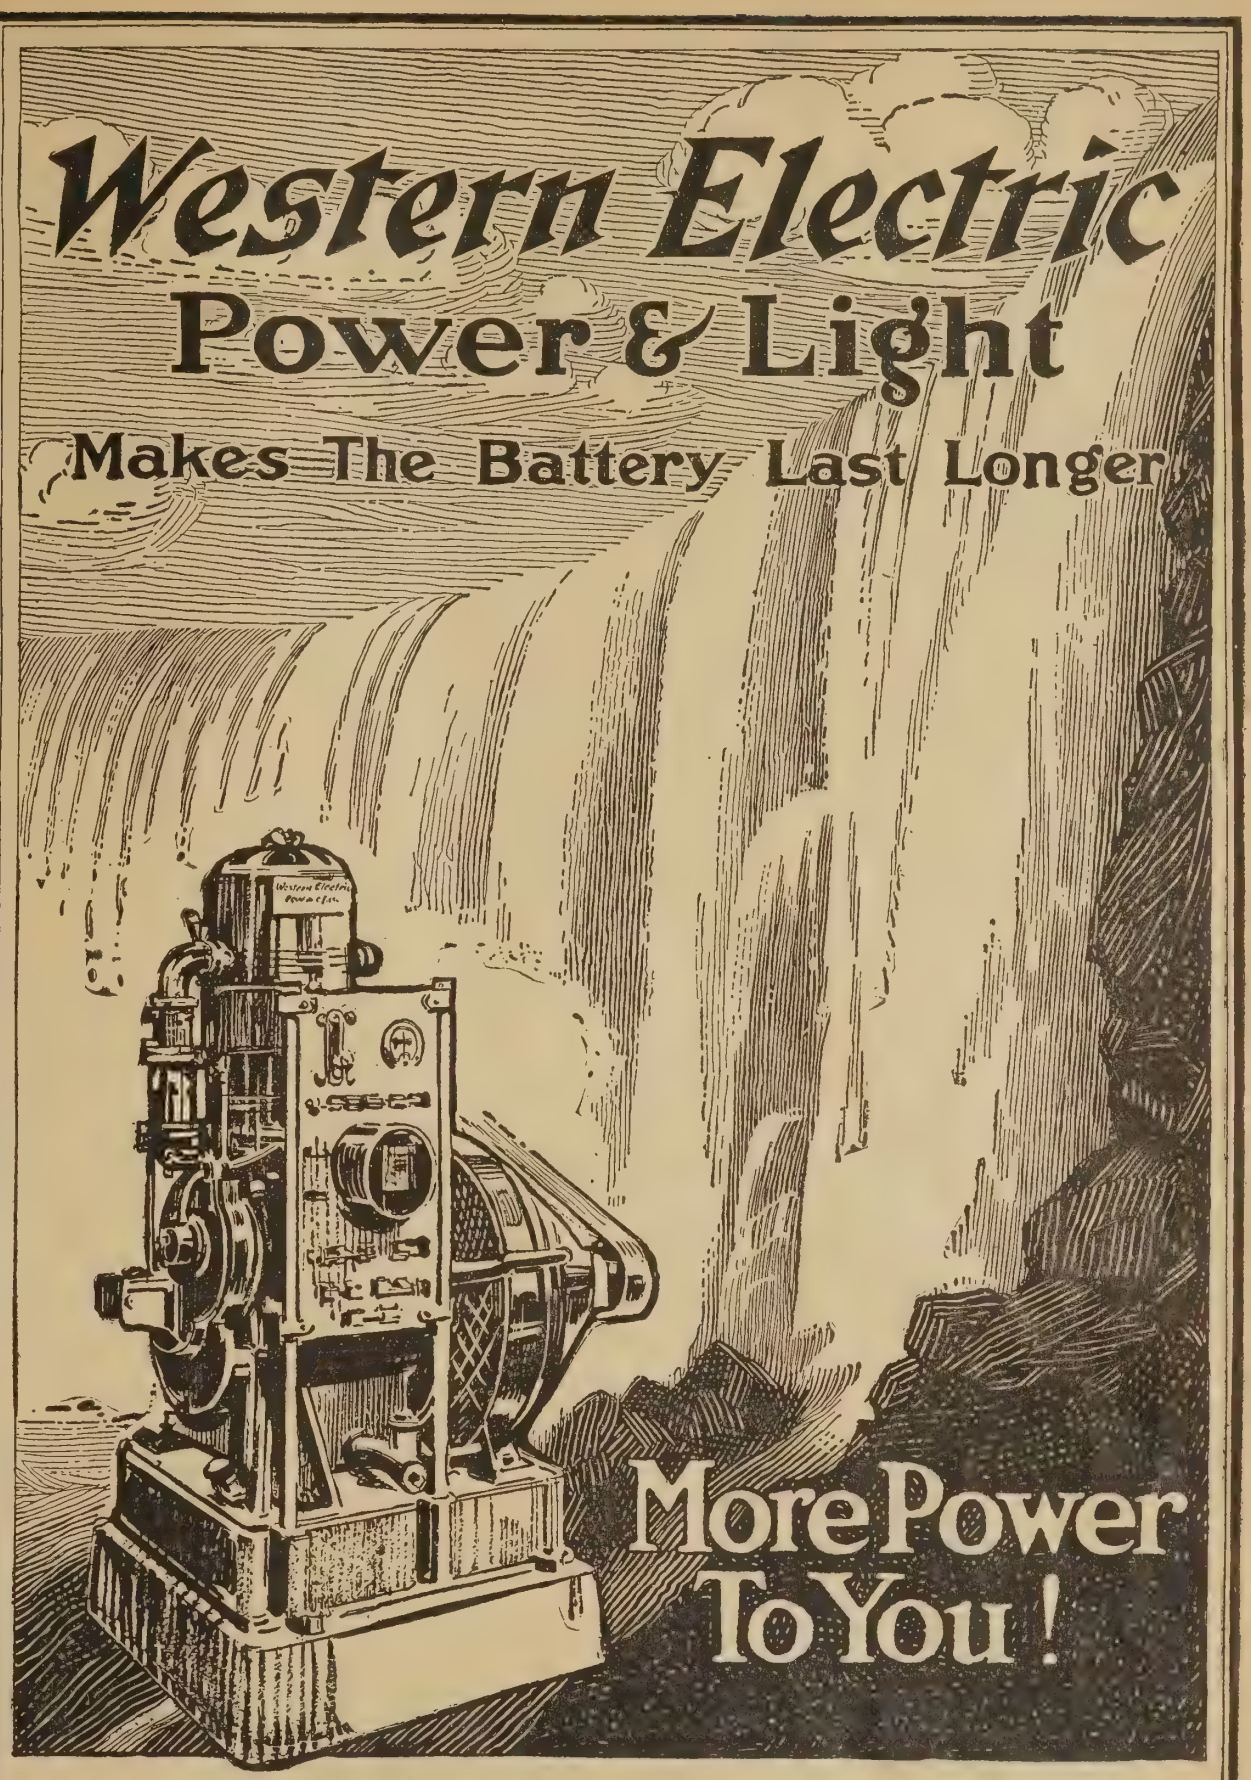
The school publishes its own school paper, printed in the school print shop by the students who are studying printing. Besides this, some printing of a commercial nature is done for persons residing in the community. The practical phases of the subject are the only ones considered, the presses and the assortment of type being quite sufficient for a variety of work.

Plans are already under way for a Community or Patron's Day to be held in the spring. At that time, there will be a most credible exhibit of school work, a program of drills and pageants with a field day for boys from all of the grade rural schools in the township.

Last fall this school's exhibit at the state fair at Springfield won first honor in class of high schools, and also the sweepstakes in the entire school exhibit, and the exhibit next year will surpass that of 1920.

There is an annual May Day program. This year it will consist of a musical festival and community play given by community talent.

When Professor Henley was asked the secret of the school's success, he replied: "I think the secret of whatever success we have here lies, not in the things done, but in the fact that we try to do something that will interest everyone, and the spirit of cooperation on the part of the people of the community. I presume this spirit is the outgrowth of community service."



The beautiful thing about it all is there is nothing strained or forced about any of the programs or school activities. Everything seems to be perfectly natural, everybody is perfectly happy and contented, yet striving for personal and community betterment. Let the rural pessimist journey to Gurnee, Illinois, and he will become an optimist. Let him, who is discouraged over the proper solution of our rural problem, make this same pilgrimage, and he will be increasingly hopeful for the future of American rural life.

Dairy Production of Quebec

The preliminary report on dairy production in Quebec shows that there were in operation 1,813 creameries and cheese factories in 1920, a decrease of 54 during the year. The number of cows supplying these factories is 595,486, an increase of some 34,000 cows. There were 37,681,366 lbs. of butter manufactured, an increase of about two and one-third million pounds over the previous year. There were 52,441,504 lbs. of cheese manufactured, a decrease of over five and one-half million pounds. The average price of butter was 55.8 cents, an increase of not quite ½c a pound over the previous year. The average price of cheese was 25.4c in 1920, a decrease of nearly 1c per pound. The total value of both butter and cheese amounted to $35,708,603.

Birds are good neighbors. Nest boxes should be in place for them. A bird bath for the hot days of next summer might be planned now.

Sloth, like rust, consumes faster than labor wears.—FRANKLIN.

Help that pays its own wages

This extra powerful Outfit with the pulley does a man's work for a few cents a day, running pretty nearly all your machinery. It saves your time in the bargain—and for a farmer certainly time is money.

Learn how the Western Electric Power and Light Outfit can help you. Write for booklet HD3 to Western Electric Company, 500 South Clinton St., Chicago, or 151 Fifth Ave., New York.

SAVE MONEY
On Your Silo Roof!
PRICES SLASHED! Here is a roof that will fit any make of silo. Price only a little over half what it was last year. Neat and attractive in appearance. Strongest roof made. Can be put on in a few hours time. The sliding top makes it the most convenient roof for filling, on the market. If your silo dealer does not handle it, write us direct. Waukesha County Dairy Show

Waukesha County, Wisconsin, is undoubtedly better known among dairymen and dairy cattle breeders of the country than any one other county in the United States. It isn't because she has so many dairy cattle, for there are several other counties in the state with practically as many or even more. Neither is it simply because her cattle are good ones. It's the men who own those cattle that have done it. They not only have good cattle and know it, but they have left nothing undone to let other people know it. The Waukesha Dairy Show is one result of this Waukesha County characteristic.

Two years ago the leading breeders of the county felt that their county should have some kind of a fair or exhibit. They did not, however, apparently take kindly to the idea of ordinary county fairs like those held in 999 other counties so they conceived the idea of a county dairy show.

The first year it was decidedly a success, last year it was better, and this year it showed an even greater improvement. The showing of dairy cattle was one that would have done credit to any state fair, in fact, it included several of the winners from the big circuit of 1920. There was a good exhibit of sheep and swine; dairy products, grains, and vegetables had a place, and commercial exhibitors took all the space they could get, even to the extent of a large tent which housed the automobile and machinery exhibit.

The only serious criticism one could make of the show was a lack of space. It has outgrown the sale pavilion which housed it, but the proposed addition to this, which is expected to be built during the coming year, should do much to overcome this difficulty.

The Cattle

The dairy cattle exhibit this year was not larger than last, but it was only the limited space which prevented a very considerable increase in numbers. The committee in charge realizing that this difficulty had to be met, limited the entries to not more than eight from a herd and no more than two of them in a single class. The result was 135 head owned by 31 exhibitors, with the Holsteins and Guernseys well in the lead showing 53 and 41 head respectively.

Axel Hanson of Minnesota did the judging.

Seventeen Holstein exhibitors brought out an excellent showing with good competition in 13 of the 14 classes. Six yearling bulls made the best as well as the largest class among the males.

King Pontiac Parthenia Champion, owned by Wieffenback and Boller, and Sir Fobes Canary Ormsby Skylark from Riverdale Farm were particularly good ones and either of them would have been a creditable champion at a much larger show. The former had an advantage in size, more style, and enough better type to enable him to win out not only in his class but as junior champion over Bonair Farm's senior calf and Sir Segis Ormsby Bess, Aitken Bros.' junior calf. He was, moreover, good enough to beat the senior champion, Hengerveld Banostine Gerben, Finkler's aged bull entry for grand championship. The latter defeated Hartog Gerben Colantha, Bonair Farms' winning two-year-old.

Competition in the older female classes was far from interesting, Aitken Bros. owning the aged entries and Geo. Barte the only two-year-old shown. Doetje Nellie was the best aged cow as well as senior and grand champion.

The young classes were better filled with 8, 9, and 11 entries, and plenty of competition in each of them. Ormsby Queen Keyes, owned by Aitken Bros., and Bonair Princette Ormsby from Bonair Farm furnished particularly keen competition in the yearling class. Judge Hanson favored the former and later made her junior champion over Bonair Pearl Fytze Ormsby 2nd and Cloverdale Bess Ormsby, the winning senior and junior calves owned by Bonair Farm and Jno. J. Roets & Sons, respectively.

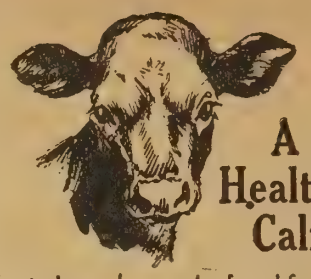
Aitken Bros. won the blue in all of the group classes.

Seven exhibitors brought out the 41 Guernseys and no one of them had things his own way, although in the end Goodhand Kingston and Son carried away 7 of the blue ribbons out of 10 for which they competed.

Imp. Itchen May King, owned by Fox and Kingston, was a popular winner in the aged class in spite of a slight lameness and nothing in any of the other classes was good enough to beat him for either senior or grand championship. C. J. & W. A. Connell's Belgrade of Beaver Ridge was the best two-year-old bull in a class of three.

Moede & Koebler, beginners, and with but two entries at the show, carried off junior championship with their junior calf, Rex'es Chief of Maple Hill, defeating Steadfast of Muskego and Aristocrat of Muskego, both owned by Kingston & Son.

The Guernsey female classes were the most interesting of the show. Some of them were smaller than similar Holstein classes but, as a whole, the entries were much more evenly matched.



A few years ago when J. R. Love & Son bought Imp. Fawn of Sarnia for $180 they were not figuring particularly on a show cow, but she looked so good in her class that Judge Hansen had to put her first. F. E. Fox's Forest's Ramee of Hawthorne was her closest competitor in the aged class, but she lacked the substance to win. The old cow was a good senior champion over Benton's Mabel of Waukesha, the winning 2-year-old owned by F. E. Fox.

Among the junior entries, the very best one was Aviator's Jewel of Waukesha, an especially good junior calf, owned by Fox. She was an easy first in her class and a popular junior champion, but lacked the age to defeat so good a one as Love's cow for final honors. Kingston's Hopeful's Miss of Sunny Slope was first in the yearling class and among the senior calves J. M. Harvey's King's Emerande of Utility stood first. Goodhand Kingston & Son won first in each of the four group classes.

Three exhibitors, John Kaderabek, Phil. H. Jones, and John Swartz, with 17 entries made the Brown Swiss showing much better than a year ago. Kaderabek's Cincey's Nick was the only aged bull shown. He defeated Jones' two-year-old Mabel's College Carl for senior championship and won grand championship as well.

Stephen of Bryn-Coed, Jones' winning junior calf was junior champion.

Alice of Bryn-Coed from the same herd, was first among 4 aged cows, senior champion, and grand champion over Kaderabek's Ginger K. of Villa Pine, the winning junior calf and junior champion. Jones also won

A Healthy Calf

—is the result, not only of good feeding, but of **protection** against germ infections, such as scours.

Experience has taught the wise cattle man to rely upon a good safe disinfectant. A bottle of B-K is his helpful agent. When used internally it destroys germs, acts as an anti-acid and sweetens the stomach, heals inflamed membranes, relieves irritation, restores healthy action. B-K contains no poison, acid or oil and may be given freely in the milk and drinking water.

Never be without B-K—You will surely need it—and, it is always ready. Sold everywhere.

Complete MILKER $123!

No installation expense!—run by hand

AT LAST! A milker for *every* farmer—whether he has few cows or many! The Page *Hand Operated* Milker—only $123. One-fourth the work of milking by hand. So simple, a child can run it. Like hand milking—adjustable to any cow. Send coupon below. Find out how to end milking drudgery and solve your labor problem.

For Small or Large Herds

The man with 6 to 16 cows can use this model, never needing a power driven milker. The man with a larger herd can use it to try out machine milking in a small, inexpensive way and **change later to our engine or electric power model.** Hand Power model accepted in trade at almost full purchase price.

The Page, in any model, is simple—has fewer parts—therefore—*costs less.* Scientific, practical, easy to operate sanitary.

On Trial!

Learn how we stand back of our machine with an absolute iron clad guarantee that it *must* do the work if operated according to instructions. Try the Page Hand Power Milker on your herd and see, if after thirty days, you are not delighted with the results. 90 days to pay. *Just find out for yourself. Write for our offer.*

Send Coupon for FREE BOOK!

Let us send you our free catalog. It's full of important facts—an education in milking machines. Learn how to get the greatest milking service at the lowest cost. Learn also how you are completely protected in giving our hand power machine a trial on your own herd. Send the coupon today.

Lowe Brothers

A brand new car for less than $4

NEIGHBOR Bill told me about the bargain. Told me, Wednesday.

So, Thursday, I bid my old car good-bye. We shut the door on it, and never looked at it until Saturday morning, when it was time to go to the Sunday School picnic.

Wife was considerably fussed. Declared the car wouldn't be fit to use. When I opened the door, there it was, just wreathed in smiles, and hard as you please.

Maybe we didn't feel all puffed up, when a lot of the folks at the picnic, accused us of buying a new car.

When a fellow can buy a couple of quarts of Lowe Brothers Auto Varnish Color for $4. and put it on the car himself, Thursday, and use his car, Saturday, looks like everybody who wants to, can have a new car. You can get this Auto Varnish Color down at the paint store. Comes in 11 colors. No trick to put it on, or I could never have done it.

Paints

first on his senior calf, Judy of Bryn-Coed, but in the yearling class both he and Kaderabek had to give way to Swartz with twin entries, Twin Ada No. 1 and No. 2, first and second place winners.

Miss Clara Barker, Wm. Knight, and Julian Ries entered the sixteen Jerseys at the show. The latter had but one entry, Noble Majesty Raleigh, the only aged bull shown, but he managed to win both senior and grand championship on him.

Knight owned the only other bull entries, a two-year-old and a senior calf.

The three female championships were won by his senior and grand champion cow, Majesty's Golden Bessie and the junior champion senior calf.

Miss Barker showed the winning two-year-old heifer and junior calf.

When it came to Ayrshires, Adam Seitz and Sons had everything their own way, the only competition being in one class where they had two entries, and for four of the championships. No bulls over a year old were entered. Cavalier's Ping Pong was junior and grand champion bull, Cavalier's Ella, a senior calf, was junior and grand champion female, and Buttercup's Perfection was senior champion.

Blue Earth Co., Holstein Sale

The Holstein breeders of Blue Earth County, Minnesota, are never quite satisfied to hold a sale just as other counties do. They make their sales a get-together time as well as a sale. They're worth while attending.

This year their third consignment sale was held at Mankato. On the evening previous a very well attended smoker was held at which a registered heifer was raffled, going to a junior member of the firm of F. H. Sohre & Sons.

Fifty-one registered Holsteins were sold on March 22 for a $300 average with the females averaging just over $400. Top price of the sale was $1,200 paid for a two-year-old daughter of S. P. O. M. 14th bred to Ormsby Korndyke Lad 8th. She was consigned by Marlow & Randall and purchased by H. E. Salsbery & Brush Bros. of Minnesota.

Ten grade females including a heifer calf and several open yearlings sold for $1,250. The top priced grade, which brought $220, had a C. T. A. record of 544 lbs. fat.

The Minnesota Holstein Breeders' Association managed the sale, Sec. Scott in the box.

Following is a list of those animals selling for $300 or more and buyers:

C. A. Bartheleing, Minnesota	
Mankato Johanna Ormsby Bess	$700
Mankato Colantha Ormsby Bess	650
Lilamere Bonnie Clothilda	760
Mankato Mechthilde Ormsby	650
Acme Alice Spofford	410
Lady Pietertje Piebe	400
Far Oakes Lily Ormsby	300
Miss Korndyke Gerben Ormsby	430
Mankato Bess Burke Ormsby	475
Olathe Aaggie De Kol 2nd	700
W. Wiechman, Minnesota	
King Colantha Ormsby Bess 12th	$300
Schermerhorn Farms, Iowa	
Model Wayne Boon	$360
Chas. Hill, Minnesota	
Salsberry Lockhart Minnie	$425
Lakeside Lockhart Minnie	350
St. Olaf College, Minnesota	
Olga Nelson Segis Homestead	$515
Mankato Canary Ormsby Bess	630
T. E. Gage, South Dakota	
Johanna Tritomia Mercedes	$700
Brush Bros., A. M. Brush & Son, H. E. Salisbury, Minnesota	
Mankato Floa Ormsby Mercedes	$1,200

36th Cow With 1,000 lbs. Fat

I am pleased to announce that the Holstein-Friesian cow, Adirondac Wietske Dairy Maid 204072 has just closed a long-time test, and is credited with 31,899.8 lbs. milk containing 1,036.09 lbs. fat in 365 days, thus showing an average of 3.25 per cent fat in the milk. She freshened at the age of 7 years, 10 months, 2 days. Her sire is Gem Paul Johanna; her dam is Wietske Dairy Maid. She was bred by Mr. Harry Mason Knox, New York, and is owned by the Bridgford Holstein Company, California. Her best seven days' official production made during the lactation period is 860.3 lbs. milk containing 30.930 lbs. fat, this test being begun 19 days from freshening. Her 365-day fat production of 1,036.09 lbs., equivalent to 1,295.11 lbs. butter on the 80 per cent basis, gives her 21st place among the first 36 cows producing above 1,000 lbs. fat in 365 days.

Malcolm H. Gardner, Supt. A. R.

Don't think of New York as an industrial state solely. In 1920 it ranked fifth in total value of all crops produced; and Texas, Iowa, Illinois, and Kansas, which came ahead, are all larger than New York.

When writing advertisers please mention Hoard's Dairyman.

International Hay Machines
speed up hay harvest

McCormick and Deering Self Dump Rakes

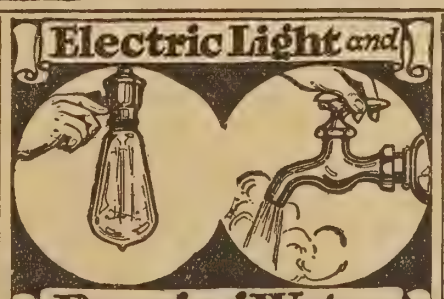
International Hay Tedders

International Side-Delivery Rake and Tedder

International Sweep Rakes and Stackers

International Single and Double Cylinder Hay Loaders

THERE are two big reasons why it is desirable to speed up hay harvest—the cost of labor and the pressure of other work. The quickest and most economical way to speed up haying is to employ efficient time and labor-saving machines.



McCormick, Deering and Milwaukee mowers are light in draft, easy to handle, and can be depended upon to cut hay every minute. McCormick and Deering rakes get all the hay. International tedders hasten curing. They also insure more uniform curing and, therefore, better hay. The International combined side-delivery rake and tedder is an economical machine in that it can be changed instantly to rake or ted.

Think of the time and labor an International hay loader would save you! Hay makers know its popularity.

International sweep rakes and stackers are big time and labor savers especially suited to large acreages.

International hay presses multiply hay profit by putting the hay in the most economical shape to handle, haul, feed and store. The smooth, tight, neat appearing bales from an International hay press bring the highest market price. See the International dealer.

Electric Light and Running Water from one plant

You can now have all the convenience and comfort that come with electric light and running water in your country home no matter where you are located. One complete, compact system furnishes them both.

KEWANEE COMBINATION SYSTEMS

save money on first cost, last longer, require fewer repairs than any other installation, and never fail to give perfect, uninterrupted service year in and year out. No matter how large or small your farm, there is a Kewanee System that exactly fits your needs.

An abundant supply of running water under strong pressure is always ready for use. Electric light and power for every purpose is yours at the turn of the switch.

Write for bulletins on *Running Water, Electric Light,* and *Sewage Disposal.*

KEWANEE PRIVATE UTILITIES CO.
422 S. Franklin St., Kewanee, Ill.

A Sanitary Dairy At Low Cost

FREE Sample and Booklet

SANITARY, sweet-smelling, dairy machinery and utensils with little expense and trouble are yours if you pay

One Cent a Gallon For

STERILAC

Sterilizes — Deodorizes — Cleanses

Sterilac is 45 times as effective as carbolic acid—is non-poisonous and non-irritating—does not injure metal nor rubber—can be used to purify drinking water. Deodorizes and leaves no chemical smell. Disinfects milking machines, cream separators, cans, bottles, refrigerators, shelves, tables, floors, drains, etc Delays souring of milk, reduces bacterial count and prevents spoilage.

Comes as a powder—dissolve in water as you need it. Withstands hot weather better than other disinfectants.

Bottle to make 75 gallons—$1.00—to make 300 gallons—$3.00. Literature and sample to make 10 gallons, *free.*

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

The Truth About a Seed

Seed planting time will soon be here, boys and girls. Every one is interested in seeds either directly or indirectly. The city man needs seeds to furnish foods for himself and his family. The farmer and the gardener need seeds for this purpose, too, but there are other reasons why these two classes of people must have seeds and perhaps the most important of these is this: Seeds are necessary to produce more seeds and also for the production of crops with which to feed the animals.

Now there are good seeds and bad seeds and although the latter class is cheaper in the beginning, they are usually the most expensive finally because they do not do what we want them to. Nature's intentions are to produce good seeds, but owing to many reasons her plans are not always carried out. We must not forget that the most fundamental thing about the next crops which we intend to raise is to plant good seeds.

But as familiar a thing as a seed is, there are few people who can tell you much about just what a seed is and what it contains or how it starts to grow, and we think that every boy and girl should know the facts about a seed and now when we are about to plant them is a good time to learn. There are many interesting lessons to be learned from the wisdom of Mother Nature and to us there is none more interesting and vital than can be learned from a seed.

We perhaps all know that flowers are produced by the plants that seeds may be formed, and it is an iron clad law of Nature that whenever a seed is produced, there must have been a flower at some earlier date. Some people think that flowers are produced just because they are pretty and we like to have them, a fact which is far from the truth. They are ignorant of the real truth and they do not know that inside of the pretty parts of a flower are the parts that will make the seeds. There are two very necessary processes that take place within a flower. One is called pollination because it has to do with the yellow dust or pollen of a flower getting onto another part of the flower. The other is known as fertilization and it consists of a grain of this yellow dust uniting with a special cell to form the seed. Each of these acts is absolutely necessary if seeds are to be formed. And after these things take place the flowers usually dry up and wither away and at last we say the crop is ripe, meaning that its seeds are formed.

But we do not have to be as particular about some kinds of seeds as we do about others in order to have good seeds. Such crops as wheat and oats ripen their seeds at a time when the weather is warm and dry. This is a great advantage because such seeds dry out quite naturally and then we can store them away and they will keep. On the other hand, with a crop like corn which ripens its seeds late in the season, we are compelled to pick the seed and place it where it will dry out quickly if we want the best seed. And so we talk about curing seed corn in the fall and every good corn grower knows enough not to depend upon corn that remains in the field after the crop is mature if he wants good strong seed. It is not good to allow seeds to carry very much moisture after they are once mature for any length of time. They begin to mold and they lose their strength.

Some people would speak of a potato as a seed and we commonly talk about seed potatoes, meaning, of course, the ones from which our next crop is to come. But a potato is not a seed because it is not the direct result of a flower. What then is a seed? If we say that a seed is a small, dormant plant formed directly from a flower and having a supply of food for the little plant to live on, we are quite correct and then we will not regard a potato as a seed. We are little inclined to think that inside of a seed there is life as we shovel over the wheat in a bin or as we give a horse his feed of oats, and it is only at planting time that we are impressed with this fact. And so we all know from experience that if we surround a seed that is not too old and one that has been properly formed and taken care of with moisture, warmth, and air, it begins to grow. As interesting as this all is, it becomes more so when we examine the inside of a seed like a kernel of corn that has been softened by allowing it to soak in warm water for about six hours; so we are going to ask you juniors to do this and look for the following things. First we are interested in finding the little plant that we have already spoken of.

GOOD SEED IS THE BEGINNING OF A PRODUCTIVE GARDEN

On one side of the seed there is a whitish looking scar. Every seed that you may examine has this and so it must be of some importance. If we take a knife and cut off a thin slice from this side we will find just what we are looking for, the little plant. To be sure it doesn't look very much like a corn plant, it is so small, but that is exactly what it is. Two distinct parts are plainly visible, the upper one will form the stem and leaves and the lower, the first roots that the little plant will have. Although the two do not appear to be connected, they are, and this little stem has a special name that is rather difficult to pronounce, but we are sure that the juniors will master it. It is called hypocotyl and the two parts that it connects, the one to form the stem and leaves and the other the first roots, are known as the plumule and the caulicle. These are new and rather difficult names you will say, but if you want to be intelligent about seeds you will have to learn them. These parts are all there is to the new plant, but not all that there is to a seed.

Whether or not you know it, a seed does not have to be placed in the soil to make it sprout. But we do know that a plant cannot live very long unless it is growing in the soil, for there are certain things which plants must have that they take from the soil. So it would be a sensible thing to believe that since a seed can sprout without contact with the soil, there must be a place in the seed where all these things are stored, and that is exactly the case. The flour we get from the wheat contains these very things, and so what we live on, the plants must also have. Nature has seen to all this when the seeds are forming and so she packs a store house of food about the little plants. And so all that surrounds the small plant in the seed is stored food. This is called the endosperm of the seed and it feeds the plant with the same things that it will later get from the soil. It is but a simple matter to prove all this. If we dig out the germ from some soaked kernels of corn and place them in a germinator, the plant will grow but very little compared to those which we have not touched. This shows that the part called the endosperm feeds the little plant for a time.

On the outside of the seed is a covering which we can easily peal off. This is called the hull and it protects what is on the inside. And so we have seen that the kernel of corn consists of three main parts, the hull, the germ which is the new plant, and the endosperm which contains the stored food. But you ask, how can the little plant live on the starch and protein that is in the endosperm? It is not likely that it can use solids for food. In this respect it is very much like ourselves. We eat solid food, but it can only become of use to us after it has been digested so that it can be absorbed by the blood. Plants do a very similar thing and so we find that after the seed has become thoroughly soaked the stored food starts to become digested, and the growing parts are fed with the digested food. All very mysterious to be sure, but nevertheless it is the truth.

And now we should know some things about this digestive process that goes on within a seed that is sprouting. The very outside of the germ that lies next to the endosperm consists of a special layer of cells that acts as a digestive organ, and it would not be out of place to compare it to the stomach of an animal. This part of the germ is called the scutellum and from it comes a digestive juice very much the same as comes from our stomachs after we have eaten a good dinner. This juice acts upon the starch of the endosperm, changing it to forms of sugar which are soluble in water and hence when the growing plant absorbs the water, it also gets the food that it has dissolved (so nicely has this all been arranged by Nature) and by the time this store house of food has become exhausted the plant has become firmly anchored in the soil and draws from it the very things that the seed has been providing up to this time. And in all of this we can see a reason why the big seeds are usually the best, for they have a larger supply of stored foods in their endosperms and the little plant is liable to be considerably stronger.

The Junior who makes all of these examinations will get his information first hand and consequently will have a keen appreciation of the value of planting good seeds.

At Hemyock, Devonshire, England, the first Boys' and Girls' Calf Club in Great Britain has recently been organized. P. B. Tustin, who initiated the organization has written to "convey the best wishes of the first Brit-

ENGLISH BOYS AND GIRLS, MEMBERS OF THE FIRST CALF CLUB IN GREAT BRITAIN

ish Boys' and Girls' Club to their cousins in America". He says, "If any of the members of the American clubs will write to their British cousins at Hemyock, Devonshire, England, they will be very glad to hear from them and reply to their letters."

The "Devon and Somerset News" in reporting the organization of this club gives the following information which indicates the variations from the plan followed in the United States:

"The club is entirely composed of sons and daughters of local farmers, between the ages of 14 and 18. The business is conducted by the members themselves, who have selected an executive from among their number.

"The members number 21, and on Monday, in Hemyock Market-place, each was allocated a calf. The calves are Shorthorns, and have been selected from cows with good milk producing records—from 600 to 1,000 gallons. The calves will be under the care and attention of the holders for the next twelve months. At the expiration of that time they will be scored on points and prizes awarded to those who get the highest number of points over the original score. During the period the members will receive free instruction as to the rearing of calves from experts appointed by the United Dairies. It is hoped, also, to arrange visits to various dairy herds and shows, when demonstrations will be given by experts, also by authorities on "dairy farming on arable land".

"Parents of members issue promissory notes for the present-day value of the calves. If in twelve months' time the members wish to retain the calves they may do so on redemption of the promissory notes. On the other hand, if they do not want to keep them the calves will be put up by auction, and the members will receive the difference between their present-day value and what they then make."

Junior Letters

Hoard's Dairyman Juniors:—I have been reading the junior letters and I get more interested every time I read them. I think some of the boys have a very good idea about learning the creed by heart. I think very much of my creed, button, and fob, so I thought I would learn it myself. I am going to school now and like it very much. I am the oldest scholar in our school this year. We just had an awful snow storm last night. I make the milk route at 4 o'clock in the morning, then we get it ready to go to town. We sell from 80 to 100 gallons a day. We run two wagons and they have to hurry to get through or they get a late dinner. Then it takes two hours to wash bottles. We start to do our choring at 3:30 o'clock. When I get out of school I hurry home to water my horses, sweep cow mangers, then milk 2 cows, and I also feed them ensilage, myself, while dad and brother do something else. Then bed my horses and clean out the barn. My cow is doing fine; has had another calf since I wrote last. Both are heifers. They are all full blood Jerseys and registered. I hope the rest of the juniors are having good luck in the stock line.

Ralph Churchill had a riddle to ask so I can answer it but will give him one now. If a hog weighs 150 lbs. and half of its weight, how much does it weigh?

I wish some of the juniors would write me. My address is R. R. No. 6, Marysville, O.

Oliver Robinson.

Hoard's Dairyman Juniors:—We have 53 cows milking and we have 26 heifer calves. Our maize is about 4 feet high now, but we will not feed it to the cows yet. We had some one year that was 14 feet high. We can't get pollard now for the pigs so we feed them ground oats.

We got a Martin ditcher some time ago and are very well satisfied with it.

We've had bush fires all around us and one of our neighbors nearly burned out.

We killed a big tiger snake in the garden this morning; he was 4 feet long. This is the third snake we have killed around the house this season,

We have 9 acres of maize and an acre of potatoes. We sell the potatoes and feed the maize to the cows out in the paddock. One man drives a pair of horses hitched to a sledge and two or three other men follow the sledge and pull the maize out at the back. The cows run round and eat all the cobs and then afterwards they eat up stalks and leaves. We cut the maize with sickles and lay it in bundles ready to be loaded.

Victoria, Australia. Thomas E. Walker.

Hoard's Dairyman Juniors:—My father has taken Hoard's Dairyman a long time and I have been interested in the junior letters. I am ten years old and in the fifth grade at school. We had our examinations last week and I passed at an average of 85%. We live on a farm of 100 acres. My father has five cows, three yearlings, and three calves. I belong to a Holstein calf club which was organized last January. My calf was taken to the county fair at Fredonia last fall and took second prize. We have three horses, one colt, and one pony. My sister and I have four rabbits and about twenty doves for pets.

New York. Erlon L. Babcock.

Hoard's Dairyman Juniors.—We live on a 40-acre farm. We have now 35 head of cattle and are milking 16 cows, feeding 4 calves. We have 4 Guernsey cows on the R. O. P. test. We are going in especially for the Guernsey breed.

I have a Collie dog and his name is Captain. My cat's name is Dodger. We have 16 pure-bred chickens and a rooster.

Well, as it is bedtime I will close hoping some of the juniors will write to me. My address is Box 32, Armstrong, B. C., Canada.

Robt. Hornby.

Hoard's Dairyman Juniors:—I live on a farm of 103 acres; about 90 acres of the land are tillable, about three of scattered timber, and about 10 of pasture.

We have six good Holstein cows, a team of young colts, aged three, named Major and May; a team of work horses, aged 12 and 8, and named Bird and Nigger. They are all dandies. I broke Major to the saddle and he rides fine. Bird and Nigger are trained to ride and Nigger is a good saddle horse.

We did have six calves but we sold four and that leaves us two, a male and a female. Their names are Zero and Spot. We are going to keep Spot as she will make a dandy milk cow.

We have 8 pigs; one is a mother sow and seven are young ones. We weaned the young ones a week or more ago.

New York. Elbert Campbell.

Hoard's Dairyman Juniors:—I am thirteen years old and in the seventh grade in school. We have twenty head of cattle and three calves, one heifer and two bulls. The heifer is a Holstein. One of the bulls is a Holstein, the other is a roan. The little heifer is mine. I feed her separator milk. She is about six weeks old and weighs about one hundred and fifty pounds. I like to read Hoard's Dairyman.

Well, will close; hope the juniors will have good luck.

Wisconsin. Walter Wirth.

Hoard's Dairyman Juniors:—Last summer I worked on a farm of 260 acres belonging to my father. It is two miles from where we live. On the farm we had 4 head of horses, 6 head of cows, and 3 head of young cattle that we are raising. We had lots of fun besides our work we had to do. I would liked to have stayed but I had to come home for school. I am 14 years of age and in the 8th grade in school. I would like to hear from all the juniors. My address is Friedens, Pa.

Wayne McCarney.

NORTH DAKOTA GRIMM ALFALFA SEED

Insure Against Winter Killing

First, by planting genuine Grimm alfalfa. Second, insist on our North Dakota grown seed which is 99% pure, scarified and free from noxious weed seeds.

Price $1.00 per pound postpaid
$0.70 per pound in 5-pound lots or more. Sacks extra, 50c.

STOCK FOR SALE

Holstein heifer and bull calves. Pure-bred, registered and high grade. Splendid individuals and breedings. Delivered to you, $25 and up. Your inquiry will be given our best attention. BROWNCROFT FARMS, McGraw, N. Y. 5*

I have usually 100 head of registered and high grade Holsteins on hand for sale. Also registered and imported Percheron and Belgian horses. RALPH HUDSON, Milton Junction, Wis. 12*

For Sale—At Elmwood Stock Farm, high grade Holstein cows, fresh and springers, by the carload. JOHN MURPHY, Mukwonago, Wis. 3*

"The Willows" offers fifty high grade Holstein cows for sale. S. D. SHAMBEAU, Waupaca, Wis. 12*

High Grade Holstein heifer calves, two to four weeks old, from tuberculin tested herds, $30 each, crated. Will ship C. O. D. WAUKESHA CO. HOLSTEIN-FRIESIAN BREEDERS' ASSOCIATION, Waukesha, Wis. 9*

High Grade Holstein and Guernsey calves. $25 crated. Safe delivery guaranteed. BROWN & COLLINS, Lima Center, Wis. 16*

Serviceable grandsons of Lola Segis Pontiac Homestead for sale, he a 34-lb., 1,000 lb. son of Piebe Laura Ollie Homestead King. Their dams are daughters of Joe Oak De Kol Fobes. Well grown, good individuals. Your choice, $150. R. W. MEAD, Stillwater, Minnesota. 10*

High Grade Holstein calves 6 to 8 weeks old, $30.00 each. We pay express and ship C. O. D. SPREADING OAK FARM, Whitewater, Wis. 11-tf.

For Sale—80 high grade Holstein milkers and springers. Will sell one or all. FRED JOHNSON, Waupaca, Wisconsin. 23*

Closing out herd of grade Holsteins, $100.00 each. H. A. KUHTZ, Waukesha, Wisconsin. 24*

For Sale—My entire herd of choice high grade Holsteins, mostly bred to and sired by thirty-pound bull. There is one full load of the best large heifers in southern Wisconsin, uniformly marked, about three-fourths white. C. L. SIMMONS, Belmont, Wis. 1*

Baby Bulls—Registered Holstein-Friesian by high class sires and heavy producing dams. Price is right. C. S. MULKS & SON, Whitewater, Wisconsin. 3-*

Holsteins—37-lb. herd sire, young bulls, cows, heifer calves. PHILIP LEHNER, Princeton, Wisconsin. 6*

Registered Holstein bulls, old enough for service. Fine individuals. Best of breeding. $100.00. Also heifers at reasonable prices. DR. BLACKBURN, Cuba, Ohio. 8-5

If you want the very best Holstein heifer calves delivered promptly, order from me. Will ship C. O. D. express prepaid at $25 each or $18 F. O. B. Oconomowoc. Also a fancy load of cows and a number of heifers priced to sell. E. F. THOMAS, Oconomowoc, Wis. 9-8

I don't want your money until you see my calves. I offer beautifully marked, high grade Holstein heifer calves at almost veal price. Registered bull calves $35.00. I ship C. O. D. and if calves don't suit don't pay for them. Safe delivery guaranteed. J. M. McFARLAND, Watertown, Wisconsin. 10-4

High grade Holstein and Guernsey heifer calves. Registered Holstein bulls fit for service. Grade cows, both breeds. W. R. GATES, Fort Atkinson, Wisconsin. 10*

Holstein show bull ready for service, large size, well marked, guaranteed right. For pedigree and price write ENOCH CARLSON, Roberts, Wisconsin. 11-2

For Sale—Registered Holstein bulls, ages from one month to one year old. JOHN STURM, Route 1, Beaver Dam, Wisconsin. 11-2

For Sale—Registered Holstein and Guernsey calves, 25 Holsteins and 20 Guernseys. BURR OAK FARM, Whitewater, Wisconsin. 11-6

Holstein bull, ready for service, 2 dams averaged 106 lbs. milk 1 day, 40.67 lbs. butter 7 days, $200. Terms. ROY HARRIMAN, Appleton, Wisconsin. 11-6

Registered Holstein bull nine months old. Beautifully marked, perfect individual, 19-pound dam. Priced right. Also younger bulls at reasonable prices. CITY LIMITS FARM, Watertown, Wisconsin. 11-3

Pure-bred Holstein bulls, all ages, for sale. High grade heifer calves, practically pure-breds at $20 each. S. E. JONES, Watertown, Wisconsin. 11-2

For Sale Three registered Holstein heifers to freshen in September. GEO. HOLMES, Route 31, Beloit, Wisconsin.

Registered Holstein bull calf. Pontiac Korndyke Mercedes breeding. Price right. HUSTED, Westboro, Wisconsin. 12-2

For Sale—2-year-old bull sired by King Segis Pontiac. His dam sired by a 31-lb. son of King Segis Pontiac. Well marked and good individual. T. B. tested. Price $150 00. O. H. HANSON & SON, Cambridge, Wisconsin.

Holstein milkers and springers. Sold farm and must sell 15 grades, $80.00. One registered cow, $175.00. Heavy producers. Easy milkers. Federally tested. No abortion. Years breeding. FRANK GARVEY, Lynxville, Wisconsin.

25 high-grade Holstein heifer calves, well marked, from producing dams, at $16.00 each, loaded in car. HARTWIG LUKKEN, Mt. Horeb, Wisconsin.

Registered Bulls—Six and ten months, from two-year-old heifers whose dams have A. R. O. records and sire No. 217150, $100 each. FRANK REYNOLDS, Lakeview, Michigan. 11-2

For Sale—Pure-bred Holstein bull 8 months old. Grandson of King Pietertje Ormsby Piebe, granddam, at 12 years, has 26-lb. record. Price $125.00. R. E. ADAMS, Woodward, Iowa.

Write me for prices on high grade Holstein heifer calves and registered bull and heifer calves. Special low price for next 60 days. Will ship C. O. D. PAUL McFARLAND, Route 7, Watertown, Wis. 12-4

My entire herd of grade Guernseys for sale. Also a few choice heifer calves at $30.00 delivered. SHADY HILL FARM, Whitewater, Wis. 23*

Guernsey heifer calves. Can ship you 10 at once about 4 weeks old. Calves out of my own herd, so know what I am shipping. $30 each crated. F. O. B. Waukesha. WERN FARMS, Waukesha, Wis. 18*

Guernseys—High grade Guernsey calves, either sex, four to six weeks old, bred for production of milk and butter. Thirty dollars apiece delivered to any station, express charges paid here. Send orders or write. LAKE VIEW GUERNSEY PLACE, Whitewater, Wisconsin. 26-tf

For bargains on May Rose bulls with type and production, write KUHTZ BROS., Waukesha, Wis. 21*

For Sale—Registered Guernsey bull calves, good producing dams at farmers' price. OTTO KRUEGER, 427 East Broadway, Toledo, Ohio. 24*

Guernsey bulls—May Rose and Segurl breeding, of serviceable age. Prices very reasonable. Write for sale list. "State your wants." DALE E. RUNDELL, Ore Hill Farm, Livingston, Wis. 8-spl

STOCK FOR SALE

For Sale—Six pure-bred open Guernsey heifers. 5 are from A. R. cows. May Rose and Sequel breeding. See ad page 518. DALE E. RUNDELL, Livingston, Wisconsin. 9-spl

For Sale—Registered Guernseys. Both sexes. Herd under Federal Supervision and free from disease. CLOVERNOOK FARM, Whitefish Bay, Milwaukee County, Wisconsin. 6-10

Guernsey calves six weeks old, $20. F. O. B. Knapp. THOMAS HAGERTY, Knapp, Wisconsin. 2*

Guernseys—Registered males and females, all ages. Breeding and type unexcelled. Grade cows, yearling heifers, heifer calves. No better quality anywhere. Tuberculin tested. Prices reasonable. Why not buy through an association and from breeders in the business to stay? Write your wants today. F. E. FOX, Secretary Waukesha County Guernsey Breeders' Association, Waukesha, Wisconsin. 6*

Holstein Activity in Kansas

(Continued from page 498)

would be needless sacrifice in selling now.

Seventy-two females were sold at the average price of $207.32. The top cow brought $525, which W. H. Mott paid for Pinehurst Segis Fayette, a four-year-old consigned by the Sunflower Herd of Oskaloosa. Mott also bought Elva Korndyke, of the Sunflower consignment, paying $500. The $500-mark was reached in only two other cases, $510 being the price in both. Stevens A. Coldren, Missouri, bought Colantha Betheline 2d for this amount. This cow was consigned by John R. Stephenson. The other $510-cow was Wayne Korndyke, which was transferred from the H. B. Cowles herd to that of David Coleman and Sons.

The nine bulls sold for an even $1,400, or an average of $155.55. Cloverlawn Johanna Piebe 54th, a two-year-old from the herd of J. C. Long & Son, topped the male consignment at $400. G. C. Dawson was the buyer. J. W. Edgecomb paid $250 for King Ormsby Colantha Pontiac, a two-month-old calf. Axtell & Hershey consigned this bull. Shungavalley Konigen Copia, a yearling from the herd of Ira Romig & Sons, brought $245, this bull going to J. E. Long.

Coldren was the only buyer from outside the state. He was among the larger purchasers, however, paying an average of $259 for seven cows. These are to be placed on a ranch in Texas. The heaviest buyer was W. H. Shrover, an extensive Hereford breeder who has begun to establish a Holstein herd in addition. His 11 purchasers, all cows, averaged $224 apiece. R. C. Jackman also took advantage of the "bargain sale" to increase his herd by 11 females, for which he paid an average price of less than $150.

More than 300 persons attended the sale. The proceeds of the sale amounted to $16,327.50, practically all of which was paid in cash.

Kansas. FRANK M. CHASE.

Pasteurization of Milk

The report of the Committee on Milk Supply of the American Public Health Association has recently been published in pamphlet form. It contains up-to-date information on the phases of milk pasteurization, the effect of pasteurization on the composition of milk, the process of milk pasteurization, and analytical control of pasteurization plants, and state and municipal supervision of the pasteurization of milk.

The first section of the report is devoted to the status of milk pasteurization in the United States and Canada, with some statistics and an outline of the control exercised over the production of market milk. The official definitions of pasteurization are given.

The effect of pasteurization on the composition of milk is covered by a review of the results of experiments on the effect of heat on milk and experiments on infant feeding.

The last section of the report deals with state and municipal supervision of the pasteurization of milk, containing a discussion of the time and temperature requirements, the department of a state or municipality to control pasteurization, requirements regarding apparatus, qualifications of plant operators, bacterial results, and penalties for violation of regulations.

Copies of this pamphlet will be supplied by the American Public Health Association, Boston, Mass., on receipt of 35 cents.

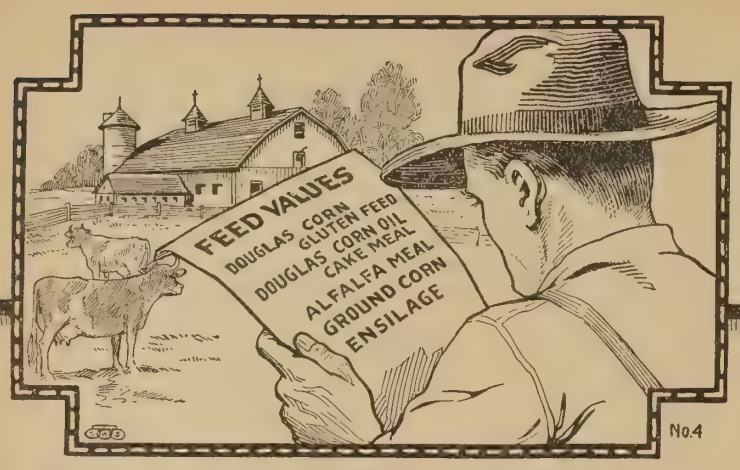
"As Necessary as Drainage and Ventilation"



Mr. Ferguson's letter was written after Circle A Cork Brick had been used in his barn for eight years. Such evidence is too conclusive to be disregarded by the dairyman or breeder who appreciates the value of modern barn construction and equipment.

Ask for "Better Stall Floors"—a 28-page illustrated book that will certainly interest you. Not only does it give full information regarding the merits of Circle A Cork Brick, but it discusses the whole subject of stall floors from a practical, common-sense standpoint. A copy of the book and a sample of Circle A Cork Brick will be sent free of charge on request.

FOR STALL FLOORS

Studying Feed Values

Every feed you grow and all feed-products of grain in the manufacture of food are useful livestock feeds when combined in right variety and proportions.

As Professor Hart of Wisconsin Experiment Station so strikingly illustrates—"Feeds vary in effectiveness according to the mixtures in which they are used."

"For example, in growth experiments with swine the efficiency of cereal proteins has been raised 25 to 65 per cent, through the use of skim milk proteins, which contributed only 15 per cent of the total nitrogen supply. *It is the combination that makes the profit.*"

Douglas Corn Gluten Feed and Douglas Corn Oil Cake Meal are two of the best feeds known for balancing the ration. They have proved their worth a thousand times. You should know them and feed them.

Our booklet, "Good Rations" gives results by practical feeders, Experiment Stations and the experiments of our own feed department.

Correct combinations and proportions of different feeds were worked out at great expense. We know what our feeds will do. We can conscientiously recommend them to you.

Write today for this booklet. Tell us what kind of stock you are feeding, and how many, also what feeds and roughage you have. We believe we can help you.

More Work From Your Horses

Horses, like people, work according to the way they feel. On warm spring days, horses sweltering under winter coats don't feel right and don't work right. You can't dry them off properly, resulting in colds, stiffness and other horse ailments.

Clip Your Horses This Spring

It will put life into them and keep them fit and ready. Progressive farmers clip their horses in the spring with a Stewart Ball Bearing Clipping Machine. Price $14 at your dealer's, or shipped by us on receipt of $2, balance on arrival. Guaranteed to please or money back.

15% More Wool

This Stewart No. 9 Machine gets 15% more wool than the best hand blade shearing. Shears quickly, does not cut the sheep, and anyone can use it.

Price, complete, $22 f.o.b. Chicago. Your dealer has it, or you can buy from us by sending $2 with order and paying balance on arrival.

Catalog No. 69 shows complete line of hand and power operated machines. Write for it.

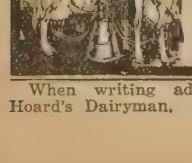
Free to Farmers

We have issued a most valuable hand-book containing one thousand uses of *Formaldehyde* and the reports of the U. S. Dept. of Agriculture on scientific seed cleansing to avoid smuts and fungus of seed grains.



FORMALDEHYDE
The Farmer's Friend

is the best and most economical disinfectant known. Officially endorsed as the standard treatment for seed grains to secure greatest yield. Destroys smuts of wheat, oats, barley, rye, etc., also scab and black-leg diseases of potatoes and other vegetables. One pint bottle of *Formaldehyde* from our laboratories will treat 40 bushels of seed. Write for this big illustrated book today—it is FREE.

Valuing Cows According to Production

HOARD'S DAIRYMAN:—A great deal has been said, and is being advocated about keeping and maintaining records of dairy cows.

The writer was impressed, in driving through the state, to find so many not keeping records, thus being at sea as to which were "boarders" and "mortgage lifters".

When purchasing cows and questioning the seller as to the quantity given, the reply is usually made, "A fourteen-quart pail". This is very misleading. When asked to be weighed the quantity seemed to fall ten or more pounds under. The only exact measure is the scales.

The writer had an order for a carload of good grade Guernseys with instructions to buy 7,000-lb. cows or better. The customer figured on his retailed milk, estimating a 7,000-lb. cow worth $125.00 and for each additional thousand pounds the increased value of twenty-five dollars per cow.

Once equipped with a scales and bulletin board with milk sheets, little time is required to weigh and record the daily accurate production of each cow. With the exact daily production as a sure guide the feeder can follow a standard, one that is followed by most prominent feeders for economical production—as a pound of grain to each three pounds of milk produced.

Another important thing to emphasize is what the actual benefit of weighing the milk is beside exact records for yourself. It is a guide to a prospective purchaser, and to a seller who has ready data at hand, thus beneficial to seller and buyer. Then he will weed out poor cows and keep nothing but profitable ones. Why work for nothing? Pride yourself with large economical production.

One more point in record keeping is that of keeping exact breeding dates. The writer, when asking when a cow is bred, gets these replies. "She is dry." "Has been dry for some time." "She was dried some time ago," and like answers. It is more profitable for the purchaser and breeder to know exactly when each cow will freshen, so she can be dried off and prepared for her next lactation.

It is believed by most breeders that a cow should have a rest of six weeks to two months and that when fed up to a certain degree, while idle, one bag of feed when she is dry is equal to two when she freshens, if a cow is thin at freshening time.

It may be difficult to belong to a cow testing association if herds are scattered, but you will find big returns if you will only use the scales in your own herd.

Wisconsin. J. L. FRUIT.

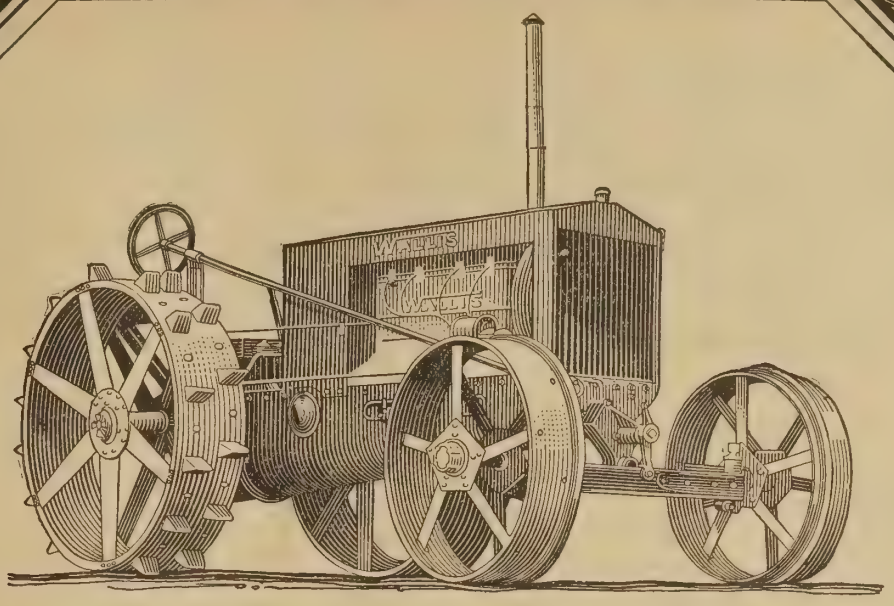
Marketing by Federations

(Continued from page 493)

to the very small item of 1.2 cents to 1.6 cents out of every dollar received for cheese marketed. The actual expenses were highest during 1914, the first year of operation. This was before the world war began and therefore before prices of labor, materials, and supplies had increased. Each of the years 1915, 1916, and 1917, shows a successive decline in the relative expenses of operating. For the years 1918 and 1919, considering the great increases in prices of supplies of all kinds, it is remarkable that the relative expenses of the federation per dollar of sales were kept down to the 1916 level. The relative expense of maintaining the federation's general office and sales-management has grown less and less each year. During six years, largely on account of increasing business, the cost of salaries per dollar's worth of sales fell from one-half cent to little more than one-fourth cent.

The rising prices of materials and supplies on the other hand caused the increased expense of one-fifth cent per dollar of sales, which brought the 1919 total of expense back to the 1916 figure of 1.4 cents per dollar of sales. Few, if any, marketing concerns can duplicate this record of low operating costs during the world war. It is a tribute of the highest order to this co-operative management.

Cost of Co-operative Management



Besides keeping costs down the federation management marketed cheese at prices averaging somewhat above the Plymouth Board prices. This was possible because the federation has built up its own cheese customers in 37 states and provided them regularly with cheese of high quality. Many satisfied customers have stated that they will always be willing to pay considerably above Board prices for high quality cheese such as the federation sends. In these two fundamentals, keeping operating costs low and maintaining standards of high quality, this and other federations have the basis for indefinite expansion and for giving substantial benefits to their members.

Cheese Producers Profit by Federation

That the federation has been profitable to cheese producers during its six years of operation is shown by its substantial growth both in members and in quantity of cheese handled. Moreover, substantial savings or profits were earned. Dividends amounting to $42,000 have been paid. The treasury holds $38,000 of undivided savings which are being used to help finance the business. Besides this the general office and warehouse at Plymouth, worth not less than $75,000, is the property of the federation and has been earned by the organization. To have accumulated and paid out aggregate savings or profits amounting to more than $150,000 during its difficult, beginning stages is sufficient success to inspire confidence. This saving amounts to more than one quarter of a cent on every pound of cheese handled by the federation since it began business; and it had handled, by the end of 1919, 52,776,134 pounds of cheese.—From Bulletin 322, Wisconsin Agricultural Experiment Station.

It is time for this country to do as much for agricultural research as it has for agricultural education and extension.

World's Championship Won by Wallis

Exact reproduction of front of gold medal, showing head of King George V

Exact reproduction of reverse side of gold medal, showing seal of the Royal Agricultural Society of England

The Lincoln Trials conducted by the Royal Agricultural Society of England are recognized throughout the world as the most thorough and exacting tests in power farming. They were severe and complete, lasting seven days and including every field and belt operation. The jury of experts was composed of engineers, whose judgment is accepted as final throughout the globe. These men by their verdict awarded the gold medal and the World's Championship in the three-bottom class to the Wallis. The sturdy power and strength of the Wallis were decisively proven.

NOTICE: We want the public to know that the WALLIS TRACTOR is made by the J. I. CASE PLOW WORKS COMPANY of Racine, Wisconsin, and is NOT the product of any other company with "J. I. CASE" as part of its corporate name.

NOTICE: The Supreme Court of Wisconsin has decided that our plows are the "ORIGINAL CASE PLOWS" and that we are entitled to the exclusive use of the word CASE on all plows and tillage implements, and in all catalogs and advertisements of same. Notice by any other concern regarding CASE plows is given because of this Supreme Court order, that our rights, the rights of the dealer and the rights of the public may be protected.

Wallis—America's Foremost Tractor—won the gold medal of the Royal Agricultural Society of England and first prize in the three-bottom class in the competitive trials held recently in England.

This world's championship is added proof of the recognition given the in-built quality and strength of the Wallis by engineering judges of world-wide standing.

What Wallis Means to Owners

To owners, Wallis means more acres per hour and more production at less cost. With prices for his products considerably reduced, the farmer must look to his costs more carefully now than ever before. Power farming is the certain road to increased production and profit—the Wallis is the dependable means to that end.

The patented U-frame of one-piece boiler steel makes possible light construction, enabling the Wallis to deliver the maximum of power to the drawbar. Light weight, combined with brute strength, is originally and typically Wallis construction.

The Wallis is the first tractor to develop a drawbar pull greater than its own weight.

The Wallis motor has the greatest horse-power for its piston displacement of any successful tractor motor on the market. Its economical performance is unequalled by any other tractor of any size, weight or power.

Greatly Reduced Prices

You can now buy the Wallis—World's Champion Tractor—and all genuine J. I. Case Implements at greatly reduced prices. The farmer has taken his loss. We are taking ours in order to help agriculture and industry return to a normal business basis. It's to your advantage to see our nearest dealer for complete information on the reduced prices affecting our entire line.

Investigate Wallis Features

The Wallis Tractor has all working parts enclosed in dust- and water-proof casings and running in a constant bath of oil; crankshaft of chrome vanadium steel; Hyatt and Timken roller bearings; and nickel steel shafting throughout transmission system. Accessibility to all parts is a special feature of the Wallis. Hand holes in U-frame and sides permit you to reach all wearing parts easily and provide light inside so you can see what you are doing. The Wallis Tractor is built by a company which has successfully served the American farmer for three generations.

The Best Individual Son

OF

Ormsby Korndyke Lad

As well as one of his very highest record sons, heads our herd

He has been pronounced by experienced and expert breeders the finest individual for his age that they have ever seen.

We recently refused an offer of $20,000 for him at ten months of age.

He has eighteen 30-lb. sisters, and outside of his own brothers has more 1,000-lb. sisters and more 22,000-lb. sisters than any bull living or dead, and more coming.

The owner of the highest 7-day record daughter of S. P. O. M. 37th and the best yearly record daughter to date for the time on test is negotiating with us to breed her to our sire.

As our herd is small we will accept a few approved cows for service at a reasonable price

You are invited to call and see one of the best individual bulls in the country,—one whose blood lines are of enduring popularity and whose sisters yet to be developed will make him famous.

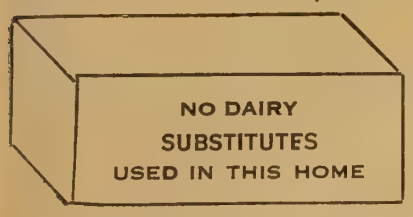
Bear Creek - - - Wisconsin



James McKone, Owner, Green Bay, Wis. William Lucia, Manager

No Substitutes Used on This Farm

HOARD'S DAIRYMAN:—I have been reading about oleo so much lately that I can't help but say something about it, too, especially after reading "The 20th Amendment".

I used to be an official tester and I found it a good deal as the article describes. At some of the places where they made world records and at places where the milk check amounted to over a thousand dollars a month, I had to eat oleo. Some would furnish skim-milk and others no milk at all. Still they holler the loudest, and we can read and talk all we want but it doesn't seem to do any good.

While traveling around, I saw a good many signs on the gate posts advertising the make of milking machine used on that place, the separator or lighting system used, if pure-bred bulls were used, or the breed of cattle kept, etc. Now, why could not every farmer boast of a sign to the effect that there is no butter substitute used on his farm?

I know there are very few true dairymen who would not be proud of such a sign and it would not be long before the oleo farmer would be ashamed to use substitutes instead of butter. We have dairy councils, farm bureaus, and different farmers' and breeders' associations who could do a lot of good in that line. If such a sign could be had for about 25 to 50 cents, and then be had from creameries, cheese factories, condenseries, etc., it would not be long before every gate post leading to the farm would be decorated with such a sign, especially if there were some little booklet explaining why butter is far better than substitutes which would be given with each sign so that a farmer could more easily explain to his oleo friends (?), and also to his town and city friends, the facts about butter and dairy products in general.

Ormo, Wis. A. R.

What shall we charge each cow per month for pasture?

This price must be determined from the general care given to the pasture and from the quantity and quality of the grass. A fair estimate may be suggested ranging from $2 to $4 per month. The proper number of cows to turn on a pasture varies with the quantity and quality of the pasture and the system of managing the cattle. If the pasture is to be practically the sole source of feed, not more than one cow should be turned in for every three acres of pasture. Where some grain and roughage is fed, less pasture acreage may be supplemented.—A. J. Cramer, Wisconsin Cow Testing Association.

Time used to profit today will accumulate power for your tomorrow.—ADAMS.

THE RIECK FARM SALES CO. - Rootstown, Ohio

Illinois Brown Swiss Sale

The members of the Illinois Brown Swiss Breeders' Association are consigning to their annual spring sale a most excellent class of cattle. Emphasis has been placed on the females and the visitor will be pleased with the quality and breeding of the cows and heifers. Only bulls that are of real merit have been included to give an opportunity to secure herd heading material. The state association regards this annual sale as a means of publicly advertising the merit of Illinois cattle. No dumping of inferior stock is practised.

The consigning herds number 16. Among them are such as the Jubilee Farms, whose show herd made a wonderful record in 1920; Roy Gilbert, whose herd led the Palmyra Testing Association last year; the Gerbers, who had the champion cow at the Peoria Fair in 1920; D. A. Wagner, whose small herd has produced many high class cows.

The cattle will be sold with the usual 60-day retest guarantee. The majority of the cattle come from herds either accredited or under Federal supervision.

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Testing for Abortion Infection

The trained pathologist has several laboratory methods of determining the presence of the infectious abortion disease in cattle, which help materially in avoiding the malady or eliminating it from a herd.

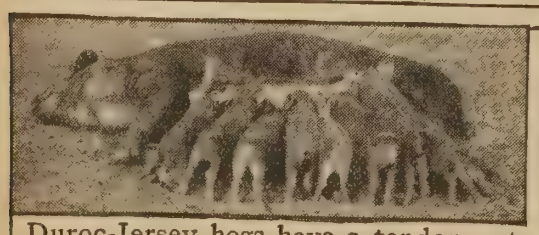
Of these the first is microscopical examination of fluids from the afterbirth (placental exudate) or contents of the digestive tract of the fetus. By this means the examiner detects the presence of the Bacillus Abortus, of Bang, which causes the disease. This method is considered fairly satisfactory, but not absolutely conclusive. A somewhat more satisfactory method is the laboratory culture of the abortion organisms. In this method tubes containing a suitable growing substance (serum agar) are inoculated with material from the digestive organs of the aborted calf. If abortion bacilli are present, colonies containing the organisms form in the agar after incubation for 7 to 10 days.

The agglutination test is now more generally applied separately or in conjunction with the complement fixation method. The first of these methods is based upon the fact that the blood serum of an animal affected with the abortion disease has the power of agglutinating or joining together cultures of the causative organism. This agglutinating effect is produced by anti-bodies formed in the blood of the affected animal by the germs of the disease. The special anti-body having this power is known as an "agglutinin". In the laboratory the scientist applies the test by adding serum of the suspected animal to the culture containing germs and noting results under the microscope, or by adding the serum in varying amounts to test tubes containing a slightly turbid suspension of the bacilli. If the infection is present the added serum causes the bacilli to agglutinate or clump together at the bottom of the tube leaving a clear liquid above. The liquid in the tubes remains turbid if uninfected serum has been added.

The complement fixation test is based upon the fact that the blood serum of normal animals contains a substance known as complement which in conjunction with a second substance known as the amboceptor causes haemolysis or breaking up or dissolving of red corpuscles of the blood. Roughly speaking the test consists in adding complement (fresh guinea pig serum) tested for haemolytic power by mixing with a known amount of sheep's corpuscles and the necessary amount of rabbit's haemolysin, to a tube containing a little of the serum of the suspected cow and a suspension of the abortion bacillus. "If the cow's serum has abortion amboceptors in it," says Professor Surface, biologist of the Kentucky Station, "these will unite with the bacteria and the complement. In this union all of the complement will be used. After this mixture has stood long enough for the reaction to take place, a little of the inactivated rabbit's serum (haemolysin) is added, and also some of the sheep's corpuscles. Now if the cow had the disease, all of the complement will have been used up in the first part of this reaction and none left in the tubes. Consequently the sheep's corpuscles will not dissolve because the complement had been fixed. On standing, these corpuscles will settle to the bottom and leave the liquid water-clear. If the cow did not have the disease there will be no abortion amboceptors present and the complement will be free in the tubes. On addition of the haemolysin and corpuscles, these will unite with the free complement and haemolysis will take place. Thus, in case the animal has the disease the complement will be fixed and there will be no haemolysis. If she does not have the disease, the complement is not fixed and haemolysis will take place.

These tests can, in many instances, be arranged for by the attending graduate veterinarian at comparatively small cost per cow. They will not, however, determine which cows have an active infection and those that have become immune, nor will all reacting cows abort. Reacting cows are or have been infected; non-reacting cows are not infected and are not immune. The latter cows are most liable to infection. The tests enable the owner to isolate cows before they abort and also to isolate cows which may not abort but which are capable of spreading the disease to clean cows and heifers.

Professor Surface says: "If every purchased cow were tested before admitting her to a healthy herd, the introduction of the disease (abortion) could be prevented. Since some cows may be infected and still carry their calves to full term, the presence of a living calf is not sufficient evidence that the cow is not infected."



In conclusion it is advised that all questions pertaining to the testing of cows for abortion disease should be addressed to the Veterinary Department of the Agricultural Experiment Station of the state in which the owner resides.

MORE PORK IN LESS TIME

Duroc-Jersey hogs have a tendency to put on great amounts of pork at an early age. They are easy-feeding animals, and raise large families. These hogs were introduced less than 50 years ago, and yet in 1918, 51% of all the hogs marketed in the country were "Duroc-Jerseys." They are uniformly red in color. Increase your profits by raising Duroc-Jersey hogs.

Write for "DUROC-JERSEY HOGS ARE PROLIFIC AND PROFITABLE"—sent free to hog-raisers by the largest swine record association in the world. Over 12,000 members.

There's No Profit in Dead Chicks

and each one of yours that dies represents a waste of time and labor—and is practically the same as taking money right out of your pocket.

To RAISE chicks it is just as important to keep their living quarters light, clean and sanitary as it is to give them proper food. The presence of lice and mites, even if not in sufficient numbers to actually kill your chicks, which often is the case, means retarded growth and a weakened physical condition, that makes them easy prey for the many diseases that attack all poultry and especially young chicks.

CARBOLA
The Disinfecting-White Paint

Instead of Whitewash and Disinfectants

is used with most satisfactory results by thousands of poultry raisers in all parts of the country, and by many Agricultural Colleges and Experiment Stations to disinfect the incubators before the eggs are put in, for the brooders before turning in the young chicks, and to keep all poultry buildings light, clean, sweet-smelling, and free from the germs of contagious disease.

CARBOLA is a white paint and disinfectant combined, in powder form. It is ready to use just as soon as mixed with water and can be applied with a sprayer—it positively will not clog—or with a brush, to wood, brick, cement, stone, tar-paper, etc., and over whitewash. One gallon covers 200 square feet. CARBOLA will not blister, flake or peel. It is neither caustic nor poisonous—harmless to the smallest chick. The dry powder is unexcelled as a louse powder, and is much cheaper than other brands. Sprinkle it freely on the chicks, in the litter on the floor, in the nests and in the dust bath.

CARBOLA paints and disinfects at one operation—saves time, labor and money—makes it easier to do work that must be done. Your money back if you are not satisfied. Order it today and keep it on hand for a rainy day job.

Your hardware, paint, drug or seed dealer has Carbola or can get it. If not, order direct — prompt shipment by parcel post or express.

CARBOLA CHEMICAL CO., Inc., 299 Ely Ave., Dept H, Long Island City, New York

bred in July last year and in November was bred again and ever since she has been bred to three different sires but has failed to conceive. What can I do to get her with calf again?

Newark, Ill. E. O. B. H.

You should isolate the cow and cleanse and disinfect the stall she has occupied as she is probably affected with the contagious abortion disease. There is no use in breeding her while her periods of heat are irregular. Flush out her vagina daily with blood warm boiled water containing two tablespoonfuls of table salt to the gallon and as soon as possible have her womb and ovaries treated by a veterinary specialist. When that has been done, normal periods of heat may ensue in which event she should be bred.

Minerals for Hogs

Please advise me what to use as a mineral mixture for hogs. They root a great deal and gnaw on bones and work at stone wall. They seem to want lime.

Howe, Ind. A. M. B.

Allow the hogs free access to a mixture of equal quantities of slaked lime, salt, wood ashes, and wood or corn cob charcoal. In addition, allow clover or alfalfa hay and let the hogs help themselves to middlings, bran, shelled corn, and tankage from a self-feeder. If that does not suffice, bone meal or precipitated phosphate of lime may be added to the feed in teaspoonful doses twice daily and increased as found necessary.

Loss of Cud; Loose Teeth

Kindly advise what to do in case a cow has lost her cud. What is the procedure when a cow, through the ravages of a cold, has had her teeth loosened?

Chicago. N. H. M.

It is a mistake to believe that a cow "loses her cud". Cud chewing (rumination) is the natural function of health and ceases temporarily or permanently when the animal becomes sick. Usually it is promptly resumed when the sickness subsides. Giving an "artificial cud", such as a red herring or piece of salt pork, is the popular treatment. Such things simply stimulate a flow of saliva which may relieve indigestion and incidentally induce rumination. In many instances a full dose of Epsom salts or other physic proves remedial. In others nux vomica and other drugs are employed by a veterinarian.

The incisor teeth normally are somewhat loose. If an abnormal condition is present, please give us full particulars and we may be able to give helpful advice.

Goiter

I have a grade Holstein calf two weeks old that had a fleshy bunch on her throat at birth and seems to remain about the same size. It is located close to head right on the larynx mostly on the right side and under throat and with the larynx makes a bunch a little smaller than a man's fist. Calf seems thrifty and vigorous. I would like to raise the calf as it is out of a good cow. Is there any treatment that would remove this bunch or wouldn't it be advisable to raise the calf? If not advisable to raise the calf would it be all right for veal?

Castle Rock, Wash. H. T.

Enlargement of thyroid gland, constituting goiter, is present and as tendency to the disease is considered hereditary, it scarcely would be wise to retain the calf for breeding. The enlargement may subside if you paint the lump with tincture of iodin every other day and give 10 grains of iodide of potash internally in water once daily for five consecutive days a week for two or three weeks or until the lump subsides or greatly lessens in size.

Blood in Milk

My pure-bred heifer gives bloody milk but there is no swelling and no bunch in the teat. When I get her about milked out then she gives bloody milk and it doesn't seem to hurt her.

Curtiss, Wis. E. J. R.

In a case such as you describe, unless just after calving, the blood comes from small growths in the teat which are irritated by the act of milking. Such growths sometimes are removable by operation. If not, the secretion has to be dried off in the affected quarters or a calf allowed to nurse. When milk is bloody just after calving, the cause is rupture of capillary blood vessels in the gland and the milk clears up in a week or two if the cow be lightly fed.

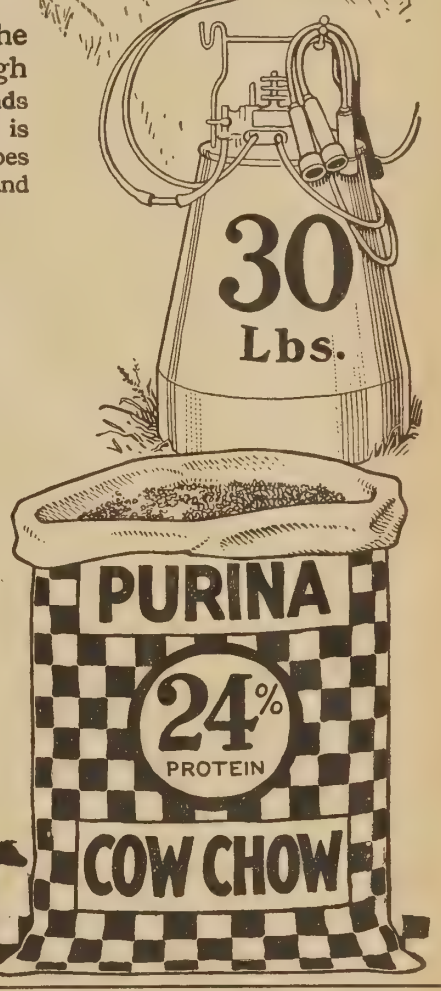
How does she make that extra 10 lbs.?

MOST grass is deficient in protein, and calcium. The stomachs of an average cow can't hold enough grass to supply the elements needed for more than about 20 pounds of milk. Yet she may produce 30 pounds for a time because she is stimulated by the new grass and probably a new calf. She does this by drawing upon the tissues of her body for the protein and minerals needed for the extra 10 pounds.

Don't let cows "run down"



Get that extra milk right along. By feeding the elements that grass lacks, you will get it. You will also stop the drain on your cows' systems.

Feed Purina Cow Chow *Now!*

Purina Cow Chow supplies *all* that grass lacks. It makes your cows go through the season with better milk records—on an average, 3 lbs. of extra milk per day for every pound of Cow Chow fed. It will leave your cows in fine shape in the fall, ready to start right off with a good winter milk production. See the nearest Purina Dealer. Write for "ABC's of Milk Making," free.

New State Records for Jerseys

Tennessee has just produced a new state champion in the junior three-year-old class with Gold Mark's Wistaria. She has just completed her test and produced 8,515 lbs. milk containing 519 lbs. fat. Her sire is Gold Mark's Golden Fern and her dam is Wistaria Rose. She was tested by her owner, W. J. Ezell.

By producing 11,930 lbs. milk containing 653 lbs. fat, Ayredale's Over-the-Top becomes the junior two-year-old champion Jersey cow of Maine. She is a daughter of Pogis 99th of Hood Farm and is out of Successful Queen, who has two R. of M. daughters and has completed five consecutive yearly records. This heifer is owned by Ayredale Stock Farm.

Out of the first 11 Jerseys to finish a year's test at South Park Farms, owned by Sam F. Crabbe of North Dakota, six have become state champions for their ages. Noble's Golden Marguerite finished as the highest producing Jersey cow in the state, with a record of 13,315 lbs. milk containing 703 lbs. fat. She started her test at five years and two months. She is a granddaughter of Noble of Oaklands and was sired by Noble Duke of Oaklands. Two half sisters of this cow have also established state records, the average of the three sisters being 566 lbs. fat.

The new champion producer for Rhode Island is Flying Fox's Marion owned by J. H. Hess. She has just finished with a record of 12,104 lbs. milk containing 596 lbs. fat. She is by Friar's Foxling's Flying Fox and out of Golden Marion D.

Indiana comes forward with a new champion, Fox's Signa, owned by Harold McCulloch. Starting her test at three years and nine months, she has produced 10,605 lbs. milk containing 592 lbs. fat. She is by Eminent Fox Purdue and out of Duke's Signa.

Ten Splendid Jersey Bulls

Good type, 6 to 18 months old. Heifers bred and open. Hood Farm Torono, King Sappho King, Loretta D. Bright Prince, etc. blood lines. Free from abortion. Dams are in the R. of M. or on test. Accredited herd. Address: J. Q. Emery & son, Edgerton, Wis.

Meridale Jerseys

Head Your Herd With a Meridale Bull

The most practical way to increase the profit of a dairy herd is to head it with a pure-bred bull. Such herds average receipts of about $26.00 per cow per year higher than herds headed by a grade or scrub.

A good bull is worth more than his cost to the dairyman. We have a few such young bulls available. They are bred from Register of Merit ancestry, and give promise of being better than their sires. Figure what the *need* of a pure-bred bull is costing you. Write for booklet and pedigrees.

AYER & McKINNEY

Offers for sale bulls from 11 to 13 months of age from A. R. dams. Also a few young bull calves of excellent breeding, and three A. R. cows. Write for sale list or come and see them.

JAMISON BROS., Appleton, Wis.

Economy in Production ← GUERNSEYS → Quality of Products

A Washington herd of 20 Guernseys, which includes the state champion for the breed and four other cows that are among the highest producers in the Northwest, are the daughters, granddaughters and great-granddaughters of one cow purchased ten years ago. One Guernsey cow rapidly grows into a herd, but what is even more important, she transmits production. Send for free literature.

THE AMERICAN GUERNSEY CATTLE CLUB, Box H37, Peterboro, N. H.

R. D. DeForest, Amsterdam, N. Y.

Anna Dean Farm Guernseys

When the Anna Dean Farm Guernseys were sold at Auction, in June, 1920

22 Cows, 23 Heifers and a Bull

were reserved for a future herd for Western Reserve University that expected to start at once an Agricultural School on the Farm. Conditions have arisen that make it necessary to postpone this project and the Trustees have instructed me to sell these cattle

At the Farm, April 15, 1921

The heifers are all open and the cows nearly all heavy in calf to Nelly's Sequel of Anna Dean Farm whose dam and sire's dam average 867 lbs. fat.

The heifers are all sired by bulls whose dams have records from 658 to 1,098 lbs. fat. They are a very choice lot. Many of the cows have fine A. R. records.

For Catalogue Address

A Richly Bred Yearly Record Bull
Offered For Sale

King Piebe Johanna Ormsby
Born September 25, 1920

He is the kind of individual we make no apologies for—Straight as a line, square-butted, great quality and loads of style.

HIS DAM

PIEBE JOHANNA HOMESTEAD—A beautiful cow now on yearly test as a four-year-old. She began her test with a seven-day record of 22.51 lbs. butter. Her dam is De Kol Piebe Burke, 1,086 lbs. butter and 27,611 lbs. milk in a year as a ten-year-old. Her sire is from a 29-lb. daughter of Homestead Junior De Kol and Johanna Fayne Rue, a 31-lb. daughter of Sir Johanna Fayne.

HIS SIRE

SIR BESS ORMSBY ALICE—A line-bred Sir Pietertje Ormsby Mercedes sire. His dam is Alice Tritomia Ormsby, a 34-lb. 1,033-lb. daughter of Sir Pietertje Ormsby Mercedes 21st. His sire is Sir Korndyke Bess, son of Bess Pietertje Ormsby Mercedes, 1,235-lb. daughter of Sir Pietertje Ormsby Mercedes and Spring Brook Bess Burke.

The two grandams of this young sire are both 1,000-lb. cows. His own dam shows every indication of some day reaching the same mark. He is priced within easy reach of the small breeder.

RICHLY BRED
HOLSTEIN BULL CALVES

out of A. R. dams and sired by our two richly bred herd sires — **King Piebe Ormsby Mercedes**, a 35-lb. son of Sir Korndyke Bess and every dam in pedigree over 22 lbs., and **King Pietertje Mercedes Ormsby**, a son of Sir Pietertje Ormsby Mercedes and out of a 19-lb. senior two-year-old dam.

Herd tuberculin tested. Write for information or visit herd.

P. FROST SPAULDING FARM CO.
C. L. Spaulding, Mgr., Warren, Minn.

"DUKE"

The only place you can buy sons of serviceable age sired by DUKE PIETERTJE KORNDYKE ORMSBY

The bull selling at the last Minnesota state sale for $33,000.00 is from the herd where he stood for three years prior to the sale. "Duke's" dam now has three records above 1,000 pounds, the last one was 1,190 pounds.

Now is the opportune time to buy one of these bulls as their sisters will be given every opportunity. Get a son now and be in line. Clean bulls from a clean herd. Prices reasonable. Write

EDW. H. ULRICH. Biscay, Minn.

6 Good Cows For Sale

THE MINNESOTA KIND

They are all by a 36-lb. sire, are bred to a son of King Korndyke Colantha Ormsby, and are due to freshen this fall and winter. They are from 3 to 5 years old and absolutely straight and right. Lack of barn room forces us to sell.

Write or come and see them.

E. J. Brosious, - Stillwater, Minn.

HARRY W. PETZOLD, R. 3, Owego, Tioga Co., N. Y.

ONYX PLEDGE RELIANCE
As a 2-year-old has 10,000 lbs. milk in the first six months. Her dam has 1,100 lbs. strictly official.

Oneida Community Dispersal Sale

LILITH ONYX
Her dam has 1,100 lbs. butter and 26,900 lbs. milk, strictly official. An Ormsby daughter.

Syracuse, N. Y., April 12-13

FEDERALLY TESTED **160 HEAD** **GUARANTEED**

THIS IS JUST A FINAL INVITATION FOR YOU TO COME
Remember This,—

Fifty daughters of Ormsby Lilith Clothilde, that sired the winning get of sire at the 1920 State Fair. He is from the same dam as King Segis Pontiac Count and by the same sire as Ormsby Korndyke Lad.

The Onyx family, one of our greatest, headed by a 32-lb. cow with a strictly official yearly record of over 1100 lbs. of butter and almost 27,000 of milk, and five of her daughters, two of them twins by the Ormsby bull. One of her two-year-old daughters, made in the first six months of her year over 10,000 lbs. milk. This is a heifer-getting family and one breeders will appreciate when they see.

Another is the Jennie Grant family, headed by the 1000-lb. dam and followed by her two daughters, one of them junior champion at the New York State Fair.

The Oneida Community herd is a working herd. It was established to produce milk for the Oneida Community employees. We have insisted upon animals that could produce for a full year and give us a calf with it.

The herd is believed to be free from tuberculosis and every animal is guaranteed under a 60-day retest wherever it might go.

The catalog, which is pretty generally distributed, will disclose to breeders something of the great number of animals we are going to sell.

We ask breeders everywhere who are interested in purchasing one or many—a foundation cow or a new herd sire—to attend. We are confident that among the numbers is something measuring up to your wishes.

JENNIE GRANT AAGGIE
A maternal sister to the junior champion at the 1920 New York State Fair.

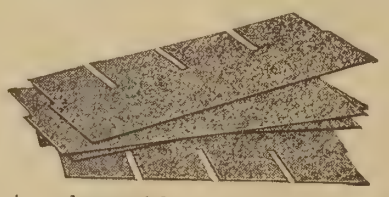
Barrett Everlastic Roofings

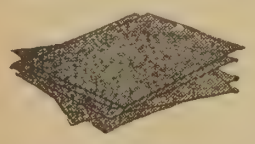
The Everlastic Line

Everlastic "Rubber" Roofing

A recognized standard among "rubber" roofings. Famous for its durability. Made of high-grade waterproofing materials, it defies wind and weather and insures dry, comfortable buildings under all weather conditions. Tough, pliable, durable and low in price. It is easy to lay; no skilled labor required. Nails and cement with each roll.



Everlastic Slate-Surfaced Roofing



A high-grade roll roofing, *surfaced with genuine crushed slate,* in two natural shades, red or green. Needs no painting. Handsome enough for a home, economical enough for a barn or garage. Combines real protection against fire with beauty. Nails and cement with each roll.

Everlastic Multi-Shingles
(*4 Shingles in One*)

Made of high-grade thoroughly waterproofed felt and *surfaced with crushed slate* in beautiful

natural slate colors, either red or green. Laid in strips of *four shingles in one* at far less cost in labor and time than for wooden shingles. Give you a roof of artistic beauty worthy of the finest buildings, and one that resists fire and weather. Need no painting.

Everlastic Single Shingles

Made of the same durable slate-surfaced (red or green) material as the Multi-Shingles, but cut into individual shingles, 8 x 12¾ inches. Laid like wooden shingles but cost less per year of service. Need no painting.

Roofing Dependability Assured—

For sixty years The Barrett Company has been America's leading manufacturer of roofings. During that time it has made and sold millions of rolls for buildings of every type.

The Barrett reputation for high-quality products and fair dealing is too valuable an asset to be endangered now by offering customers any article not absolutely dependable.

The low price at which Everlastic Roofings are sold is due to huge quantity production, modern labor-saving machinery, and the most efficient manufacturing and distributing methods.

Through the many Barrett Branches listed below, your dealer obtains prompt deliveries and can readily supply you with any of the Everlastic Roofings.

In roll roofings, you have a choice of two styles—the ever popular plain-surfaced Everlastic "Rubber" Roofing and another handsomely coated with red or green crushed slate.

There are also two styles of Everlastic Shingles, one single and one in strips of four—both surfaced on one side with crushed slate in the attractive natural shades of red or green.

In no other roofings can you obtain such high quality at such moderate cost. Look for the Everlastic name when you buy. It's your protection against inferior roofings.

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Fort Atkinson, Wisconsin Volume LXI, No. 13 April 15, 1921

De Laval

first gave us a better way of separating cream and now a better way of milking

PROOF that the De Laval Milker is actually a better way of milking comes from De Laval users from all sections of the country. They are practically unanimous in their agreement that De Laval increases the production of milk even over good hand milking. The saving in time and the increase in production of milk will soon pay for a De Laval Milker.

Send for catalog, which contains complete information.

Volume LXI — FORT ATKINSON, WIS., APRIL 15, 1921 — Number 13

Vetches in the West and South

ALTON D. HURLEY, WASHINGTON

VETCH is an important forage crop. It is used for hay, soiling and ensilage purposes in several districts in the United States. This important legume ranks as one of the most valuable of the leguminous crops for soil improvement. There are approximately 120 species of vetch. The most valuable for forage purposes are the common vetch, sometimes called spring or Oregon vetch, and the hairy or Russian vetch. Bitter, purple, scarlet, and narrow-leaved types are also included among the better known vetches. The common and hairy vetches are the most important forage types, the others being bitter and unpalatable. Bitter vetch is said to be meeting with some favor in California as a cover crop.

In the rapidly developing dairy districts west of the Cascade Mountains in Oregon and Washington, which includes the famous Puget Sound country, Southwestern Washington, the Willamette Valley, and the Oregon counties bordering directly on the Pacific ocean, common vetch has been for a considerable period an important forage crop, and, because of its established merit, is increasing in acreage each year.

Its value in those districts lies in a triple utility—hay, ensilage, and soiling. As a heavy yielding leguminous hay crop it takes high rank among the crops of the Pacific Northwest. The hay carries approximately fifteen per cent protein when cured, according to experiments carried on by the Oregon Agricultural College. This is slightly higher than the protein content of alfalfa and clover hay which carries from ten to twelve per cent of this valuable food constituent. As a protein feed it equals wheat and bran, containing but slightly less carbohydrates and fats.

Hay yields under the average farm conditions are approximately two and one-half tons per acre, but under good farming systems, including of course regular rotation systems and when sown with wheat or oats, yields of five tons per acre are common in both Oregon and Washington. The cereal crop sown with vetch prevents lodging of the heavy trailing vines. In the Puget Sound country particularly, oats is the cereal preferred. Some of the largest yields of vetch hay are obtained in Whatcom County, one of the three leading dairy counties in Western Washington.

Harvesting Methods

The main disadvantage in raising vetch hay is the difficulty in harvesting the crop because of the trailing nature of the plant. This is obviated to a considerable degree by sowing with a cereal crop as above indicated. When the vetch is heavy or once lodged, it is very difficult to cut. To facilitate harvesting several methods are followed:

(1) By cutting two swaths, rolling each onto the uncut vetch and then, when the third swath is cut, all three are rolled back out of the way. This method requires considerable hand labor as it is necessary for two men with pitchforks to follow the mower.

(2) By cutting a swath and then driving back over it, crushing it down, so that the shoe of the sickle bar will pass over it without clogging.

(3) By cutting one way and then driving back empty, having the cut swath thrown out of the way.

Vetch is sometimes cut with a binder, but when standing upright and producing average yields, the usual hay harvesting methods are followed.

Vetch sown with oats is extensively used as an ensilage crop, especially in Western Washington. In Whatcom County, where dairy farming predominates, the silos are largely filled with this combination, as climatic and soil conditions there are not particularly adapted to corn production. The yields run from twelve to fifteen tons per acre, exceeding corn, even when conditions are comparatively favorable to the latter crop.

Professor E. B. Stookey, agronomist at the Western Washington Experiment Station at Puyallup, reports yields of oats and vetch on lowlands up to twenty tons green weight per acre when fall seeded. Upland yields vary from seven to ten tons. When used for ensilage it is harvested after the pods have become well filled.

As a Soiling Crop

Vetch is also an excellent soiling crop. In the Willamette Valley especially, a green feed is found very desirable in summer to supplement pastures, and vetch and oats are found suitable when sown late in the fall. In order to provide green feed early in the spring, many Pacific Coast dairymen sow large acreages of vetch with oats or rye. The earliest feed harvested in Western Oregon and Washington is vetch and rye. This combination crop will, if sown between August 20 and September 15, provide a yield of upwards of ten tons per acre of good green feed.

In the vicinity of cities where land values are high and farm areas limited, dairy cows are frequently fed throughout the greater part of the year on soiling crops. It is found possible under such a system to feed much more economically, since four cows can usually be maintained under this arrangement on an acre of land which would, under the most satisfactory conditions, maintain but one on a pasture basis. This increased return is secured by increased forage production and elimination of waste be trampling.

In addition to the value of vetch as a producer of three classes of forage it has also an extremely valuable effect as a soil improver. In this regard it is not exceeded by any other crop according to experience of farmers in Washington and Oregon and also in the South where it is likewise an important forage crop. Almost invariably yields of cultivated crops, which should follow vetch in well planned rotations, are appreciably increased.

James Wallace, a dairy farmer of Tolt near Seattle, says, "I am going to keep on planting vetch until I have had the whole farm under a crop. It simply can't be beat for improving a worn-out soil. I always get a fine yield from any crop I sow following vetch."

Vetch in the South

Common vetch fits exceptionally well into the newer trend of agricultural development in the South, particularly in the Southeast. Its value there lies both in its effectiveness in improving worn-out soils and its worth as a forage for live stock. In that district it is grown during the winter months, being sown between the middle of August and October fifteenth. If sown during this period it becomes firmly rooted before cool weather sets in, while, on the other hand, later planted vetch suffers from dry weather in the spring more than the deeper rooted crop planted earlier. It grows through the winter and spring and may be harvested in time to permit planting of corn or cotton on the same land thus serving to provide maximum utilization of the land and at the same time to rebuild the soil.

On southern dairy farms, where plenty of forage is needed, oats and vetch are used for silage, hay, and pasture in a three-year rotation: 1st year, early corn with cowpeas between rows; 2nd and 3rd years, oats and vetch in winter and corn for silage in summer. A four-year rotation with cotton is also followed: 1st year, cotton; 2nd year, oats and vetch and cowpeas; 3rd year, cotton with vetch for winter cover crop; 4th year, corn with cowpeas between the rows.

The vetch preceding the cowpeas in the last rotation can be handled so that it may reseed itself for a winter cover crop. The land should be

MARKETING BY FEDERATIONS

MATH MICHELS, WISCONSIN

The viewpoint of a well known and successful cheese factory operator and dairy farmer. In a previous issue there was presented the viewpoint of Theodore Macklin, Agricultural Economist of the Wisconsin College of Agriculture. In these two articles we have the reaction of the agricultural investigator and the practical man of farm affairs.

THE Wisconsin Cheese Producers' Federation was born in the spring of 1912 when the farmers of Sheboygan County protested against prevailing methods in the marketing of their cheese. The many bad practices then thought to exist have since been proven and accordingly the Federation has been growing by leaps and bounds. Many difficulties and obstacles had to be overcome before the farmers finally marketed their own cheese.

It was in March of 1914 when their $25,000 warehouse was completed and the output of 44 cheese factories was assembled and handled by an experienced manager. This warehouse has since been enlarged and equipped with refrigerating machinery so that it now represents a value of about $70,000. While the Federation has been steadily growing from year to year, its largest increase came in 1919 when they marketed over 14,000,000 lbs. of cheese as compared with less than 9,000,000 in 1918. Summing up the first six years' work, we find that besides paying for their warehouse valued at $70,000, they have paid out in deferred payments $42,000 and $38,000 still remains in the treasury. These results are but trivial as compared with the benefits derived by more stable prices obtained through the year and the certain protection against cheese price manipulation. This advantage was not limited to members of the Federation, but all milk producers in the state of Wisconsin were benefited thereby.

The circumstances leading to the organization of the Wisconsin Cheese Producers' Federation have been pictured by many a writer, all agreeing that it was made possible only by the splendid leadership and untiring efforts of Mr. Henry Krumrey. The Cheese Federation, through its board of directors lead by Mr. Krumrey, is continually working on better methods and ways and means by which to further improve marketing conditions for the benefit of both producer and consumer. In November the board of directors adopted a revised constitution and by-laws, thereby further strengthening and safeguarding their organization. The past year they have taken up cheese factory supplies and now plans are under way to handle whey cream and to brand all cheese handled by the Federation.

In order that the Federation as it grows may be in a position to properly handle and market its cheese, it has decided to organize the Wisconsin Dairymen's Storage Company, with a capital stock to begin with of $250,000 divided up into shares of $50 each guaranteeing 6% interest. This storage company will take over the Plymouth and Spring Green warehouses at book value, which is much below the actual present value. Dairymen must directly or indirectly pay for cheese storage houses and their upkeep and may as well own and operate them. The storage company will remain independent from the Federation on account of the necessity of issuing warehouse receipts on cheese held in storage. This is necessary to supply a certain demand for well cured cheese. Up to this time the Federation has practically cleared its floors every week.

To eliminate unnecessary middlemen in the marketing of cheese, as well as the many other products of the farm, it is necessary to co-operate to the fullest extent. The present system of marketing cheese and other farm products has been done along the lines of least resistance, much to the disadvantage of both the producer and the consumer. Cheese is a finished product and the present wide difference in the price between the producer and consumer of from 60% to 100% is altogether too much for the services rendered. By organization, we will be able to put quality into our cheese and give the consumer much needed assurance, thereby increasing consumption. The consumption of cheese in America is only 3.8 pounds per person per year; while in England it is 11 pounds, in Denmark 12 pounds, and in Switzerland 26 pounds. By giving the consumer more assurance the consumption of cheese can easily be doubled by the American people with great advantage to them in both health and economy.

Organization of Factories

No farmer should hesitate to join the Federation as it is no longer an experiment. It is recognized as being one of the most successful examples of farmers' co-operation in the United States. Starting with 44 cheese factories in 1914, the Cheese Federation has steadily grown until at the present time 125 or more cheese factories are shipping their cheese to the Plymouth and Spring Green warehouses. Several hundred more factories are now being organized and expect to market their cheese through the Federation as soon as suitable warehouse facilities can be provided.

It is the duty of every cheese factory patron as well as every cheese maker to bring up this matter at his annual or special meetings and urge the marketing of his cheese through the Federation.

One of the greatest obstacles in the organization of cheese factories seems to be in getting the cheesemakers to co-operate. For reasons best known to themselves, and in many instances for no reason, many cheesemakers are opposing joining the Federation. The cheesemakers all over the state are much in need of education along the lines of co-operation. The co-operation of the cheese factories ultimately will raise the cheesemaker to a higher level as well as better working conditions, although the contrary is being preached to them by undercurrents from many different sources.

With many a cheesemaker it takes considerable argument and convincing proof to eradicate many wholly erroneous notions from his mind, many such notions having been planted in the minds by one, watered and fertilized by another, magnified by still another, and then harvested by someone who has neither investment nor interest in the cheese industry save the dollars to be harvested therefrom for the next twelve months. The cheesemaker must be educated to know that only that is best for him which stabilizes the cheese business and gives assurances to both producer and consumer. This applies to the makers of foreign cheese as well as American cheese.

A new organization known as the Wisconsin Foreign Cheese Producers' Federation was formed in December, 1920. This organization started out under practically the same constitution and by-laws as adopted by the Wisconsin Cheese Producers' Federation. This new organization proposes to handle Swiss, Brick, and Limburger cheese made in Wisconsin. The organizers are to be highly commended for the good work started. Organization work is now being pushed in at least four different counties, and it is to be hoped that some time this coming spring they will be sufficiently organized to launch the marketing of their own cheese.

Standardization of Cheese

One of the functions of the Wisconsin Division of Markets is to aid the producer in the proper marketing of his product. By proper marketing we mean to get the produce of the farm to the consumer in the best possible condition and at the least possible expense. By marketing all Wisconsin cheese (which means 70 per cent of all the cheese produced in the United States) under a system of grading or standards, we are establishing prices on a quality basis and penalizing poor quality, thereby giving assurance to the consumer of cheese and retaining as cheesemakers the men capable of putting quality into their product. The present system of marketing cheese on a flat basis is nothing more or less than offering a premium to the maker of poor cheese and penalizing those capable of putting quality in their product.

Many bad practices have crept into the marketing of Wisconsin cheese—i. e., our best grades after being aged are often sold as "New York cheese"; finding fault with the cheese at the factory when there is nothing wrong, as well as taking off grades at full market price; off grade cheese being sold to the consumer at good cheese prices. These and other practices naturally result in a loss of confidence in Wisconsin cheese and have a demoralizing effect on the cheese markets. By the proposed plan of selling all Wisconsin cheese on a grading basis, we will be offering a premium to the producer of high quality cheese and giving an assurance to the consumer which he never has had before.

The proposed grades on cheese as outlined are about as follows:

No. 1-A. A very high grade under which not more than 15% of the present cheese could be offered.

No. 1 would include all good merchantable cheese that are free of any pronounced defects. This grade would take about 75% of the cheese made.

No. 2 would include all cheese having pronounced defects, all "off grades".

This grading plan is receiving some criticism which is easily offset by the many advantages in its favor. For twenty years we have been trying by every conceivable method of education to eliminate poor quality of cheese and butter from the market. Today we have more "off quality" cheese and butter in the markets than ever before. This fact is denied by no one acquainted with the true situation.

In the standardizing of cheese we have the co-operation of the United States Bureau of Markets. With this co-operation, we have what amounts to a national system for Wisconsin cheese. All federal inspectors in the various markets in the United States would be deputized to follow up the Wisconsin grading. By this I mean that a car of cheese shipped out of Wisconsin, say to Chicago or New York, could get a re-inspection from a federal man wherever shipped. This aid by our Federal Bureau of Markets will be of great value to the standardized Wisconsin cheese industry. The United States Bureau of Markets is to be highly commended for its efforts and assistance given the Wisconsin Division of Markets in the

THE MACK MILK CASE, MANUFACTURED BY DR. D. W. MACK, CHIEF MILK INSPECTOR, PORTLAND, OREGON, USED FOR SHOWING THE COMPOSITION OF MILK

To show the chemicals contained in one gallon of milk, bottles are filled and labeled as follows: Phosphorus—36 grains—For repair of bones and teeth. Soda—29 grains—To neutralize acids in the blood. Magnesia—7 grains—For the body fluids. Fat soluble A—About 5 ounces—Necessary for growth and repair of the body. Milk sugar—6.8 ounces—Makes galactose or food for the brain. Casein—4.9 ounces—The best of all the proteins for blood and muscle. Butterfat—About 5.2 ounces—For body and energy. Chlorides—56 grains—To make acid for the stomach and the salt of the body. Sulphur—2 grains—To purify the blood. Iron—½ grain—To make red blood. Lime—70 grains—For the bones and teeth. Milk contains more lime than any other food. Potash—75 grains—To prevent the body fluids from turning acid. Water soluble B—About 3—quarts—Necessary for growth and repair.

Can Illinois Dairymen Afford to Buy Alfalfa Hay

H. A. ROSS, ILLINOIS

IN the general price decline of the past year, dairymen, with the possible exception of those producing for a condensing market, have fared somewhat better than other classes of farmers. Prices of dairy products have declined also, but not as rapidly nor as far as prices of the feeds which dairymen are forced to buy, and farm grown grains find a more profitable market through the dairy cow than through the elevator. The notable exception in the general low level of feed prices is hay and, unfortunately, many Illinois dairy farmers purchase considerable quantities of this roughage. It is evident from Table I that prices of the more common mill feeds show declines of from 51 to 67 per cent and that the principal farm grown dairy feed, corn, shows a decrease in price of 74 per cent. Contrasted with the average decline of 57 per cent for mill feeds and 62 per cent for farm grains is the decline of but 31 per cent for hay. What, then, are the forces tending to keep up hay prices?

The thought first suggested is that of maladjustment in the proportion of the various crops due to war time conditions. We know that Illinois farmers met the appeal to grow more wheat with an enormously increased acreage and the high prices of barley and rye likewise affected the growing of these crops. From statistics presented by the Bureau of Crop Estimates, a comparison of the average wheat acreage in Illinois during the pre-war period, 1913—1914—1915, with a similar three-year period, 1918—1919—1920, shows an increase of 695,000 acres or 28 per cent. Barley and rye show increases of 117 and 137 per cent respectively or an aggregate increase of 351,000 acres. It would seem reasonable to conclude that this increase in acreage of the food grains took place at the expense of the hay crops, and that the shortage resulting has caused relatively high prices. Such reasoning is shown to be fallacious by Table II.

The acreage of hay was not decreased but was actually increased 862,000 acres or 36 per cent and the production averaged 1,719,000 tons per year greater for the years 1918, 1919, and 1920 than for the three-year pre-war period. The decreased acreage of corn amounting to almost a million and a half acres accounts to a large extent for the increase in these other crops. Labor shortage was probably a greater factor than the demand for food grains in reducing the amount of corn grown. Since both the acreage and production of hay increased during the last three years, the relatively high prices of hay cannot have been caused by a shortage in production within the state. A similar comparison for the entire United States shows an increase of 14 per cent in acreage and of 18 per cent in production, thus eliminating the theory of a general shortage.

These oats made 89 bushels per acre but at the present farm values they would return only $34.71 per acre. The same land in alfalfa should yield 4 tons of hay, worth $96.80. Is alfalfa growing in Illinois unprofitable?

Table I—Decline in Feed Prices

Feeds	Unit	Date of peak price	Peak price	Feb. 1921 price	Decrease in price	% decrease
*Bran	Ton	May—1920	$55.46	$24.29	$31.17	56
Oil meal	"	Aug.—1919	91.66	41.00	50.66	55
Cottonseed meal	"	Aug.—1919	89.50	38.00	51.50	58
Gluten feed	"	June—1920	72.40	35.38	37.02	51
Hominy	"	Aug.—1919	77.71	25.60	52.11	67

Clover hay	"	May—1920	29.60	20.10	9.50	32
Alfalfa hay	"	May—1920	33.10	24.20	8.90	27

*Mill feed prices for the month are averages of the daily wholesale prices as quoted by the Western Feed Market Bureau.
†Grain and hay prices are estimates of Illinois farm values as reported by the Monthly Crop Reporter, U. S. D. A., Bureau of Crop Estimates.

Alfalfa is the principal hay bought by Illinois dairymen and this is largely produced in Kansas, Nebraska, Colorado, and even as far distant as Wyoming, Idaho, and Montana. Considering the distance it is shipped and the high freight rates, the present value of alfalfa hay does not seem surprising. When the last increase in freight rates went into effect, August 26, 1920, the cost of shipping absorbed so great a part of the value that shipments were greatly curtailed. As a result special rates were made between western points and central western terminal markets by most railroads. The new rates which went into effect about the first of January, and which will expire April 30, 1921, show reductions of approximately 25 or 30 per cent. The reductions, however, apply only to terminal markets and as the freight rates from these points to consumers are still very high, the price of alfalfa at these markets was forced down, the consumer getting only a part of the benefit. With alfalfa hay selling in Chicago at $24, the Idaho shipper nets less than $10 per ton. Considering the cost of baling and handling, it becomes evident that the western growers will find it profitable to feed a greater part of the crop than heretofore. Illinois dairymen, therefore, are going to find it necessary to pay relatively higher prices for alfalfa because of the decreased supply on the market. This statement does not mean that the price of alfalfa hay will go up or even remain stationary, but it does mean that because of its bulk and the high freight rates, the price of alfalfa will be relatively higher than that of grain as long as we depend upon western producers for any important part of our supply.

Perhaps Illinois dairy farmers could well afford to buy alfalfa hay when corn was selling around two dollars and oats at a dollar, but at present values a premium is placed on growing it at home. Work of various experiment stations indicates that the labor cost of growing an acre of alfalfa is somewhat greater than that of oats but less than that of corn. If, however, we neglect the differences in cost of growing and examine the gross returns per acre for the various crops, the comparison is striking. Using the farm values given in the February Monthly Crop Reporter, the gross return per acre for alfalfa yielding 2½ tons (certainly a low enough yield) would be $60.50. To obtain the same gross return ($60.50) from other crops, the yields per acre would have to be: wheat, 35 bushels; rye, 48 bushels; barley, 93 bushels; corn, 112 bushels; and oats, 155 bushels. Such a comparison is significant only in indicating the relative differences in present values and cannot, of course, be used to estimate the profitableness of producing alfalfa next year. If, however, the theory that high freight rates will tend to keep up alfalfa hay prices is sound, it seems certain that Illinois dairymen must depend upon home grown legumes to obtain the greatest profit.

Table II—Comparative Acreage of Illinois Crops

Crop	Ave. annual acreage pre-war period, 1913–'14–'15	Ave. annual acreage 3-year period, 1918–'19–'20	Increase Acres	Increase %	Decrease Acres	Decrease %
Wheat	2,513,000	3,208,000	695,000	28		
Rye	49,000	237,000	188,000	384		
Barley	54,000	217,000	163,000	302		
Hay	2,417,000	3,279,000	862,000	36		
Corn	10,399,000	8,917,000			1,482,000	14
Oats	4,339,000	4,263,000			76,000	2

*Monthly Crop Reporter, U. S. D. A., Bureau of Crop Estimates.

Alfalfa such as this makes 4 tons per acre. To obtain the same gross return, using present farm values as reported by the Bureau of Crop Estimates, this land would have to yield 179 bushels of corn or 248 bushels of oats per acre. Would it do it?

Don't Wait for the Cow

HELEN S. K. WILLCOX, NEW YORK

ONCE upon a time there was a certain very lazy man who owned a cow. As the cow had never been fed with much care or foresight, nor catered to in any particular way as to her likes and dislikes, and had never known the lure of a pound of gustatory grain or some succulent ensilage awaiting her in her manger when she came up from pasture, it had ever been her custom to wander afield as far as possible and there stay. This obviously necessitated that some one go after her at milking time, and as was previously hinted, her owner being a lazy man, he found this daily duty very irksome. So he would sit down by the pasture bars and call loud and long: "Come, Boss! Come, Boss!! Come, Boss!!!" But Bossy never came, being a sagacious animal, as cows sometimes are if we only own it, and finding the old pasture much more to her taste than the dark, dusty stable.

But her owner thought life was just one thing after another, anyhow, and if it wasn't one thing it was the next which took the joy out of it. He would complain bitterly at the ingratitude of cows in general and his in particular, which had nothing to do but eat the grass which Nature provides and then proceed to take things easy. So he would sit at the pasture bars, vainly calling for the boss who never came and bemoaning the luck which had made him a poor, abused dairyman in the beginning.

One day a neighbor came along and heard the curses and complaints the lazy man was uttering. He listened awhile in silence while the man

First Cheese Factory in Wisconsin

J. J. HARLIN, WISCONSIN

WITH so much discussion over the cheese marketing situation in Wisconsin, it may be interesting to readers of Hoard's Dairyman to know that it is just 57 years ago that the first cheese factory was erected in that state. The details of that pioneer chapter of the cheese industry lie wrapped up in the memory of Chester Hazen, whose body now reposes in a small village cemetery at Springvale, Fond du Lac County, and was the man who built the first cheese factory and who had a great vision. He is one of five men who have blazed the trail of Wisconsin agriculture. Molded and bended by the trials of clearing and breaking a wilderness to plow, he was one of the first to appreciate the great possibilities of Wisconsin as a dairy state.

CHESTER HAZEN

Mr. Hazen was born Jan. 31, 1824, in Denmark, Lewis County, N. Y., and passed his early boyhood days upon his father's farm. At the age of 15 years he began learning the molders' trade and for five years followed that business in York State. March, 1845, found him in Milwaukee seeking employment. A year later he preempted 80 acres of land near the village of Oakfield, Fond du Lac County, and a year afterward preempted 160 acres in the town of Springvale. He remained upon the Springvale farm for about a year during which time he cleared about thirty acres of land and fenced about 12. For the next three years Mr. Hazen divided his time at his trade between New York and Milwaukee, saving his earnings in order to renew his start as a farmer. In 1850 he built a house upon the land, and in 1854 married Jane A. Atwood of Vermont.

In 1864 Mr. Hazen erected the first cheese factory in Wisconsin which is shown by the accompanying wood etching. At one time it received the milk of 1,000 cows which in that day made it the largest factory in Wisconsin. Soon thereafter smaller factories sprang up to divide the patronage. The factory no longer held to the distinction of being the largest, but it did cling to the claim of being the first in the state.

THE FIRST CHEESE FACTORY IN WISCONSIN

This illustration is reproduced from a wood-cut appearing in an old atlas. It shows the residence, farm buildings, and cheese factory of Chester Hazen of Fond du Lac County, Wisconsin, as they appeared in an early day.

Mr. Hazen's interest in dairying provided the foundation for whatever progress Fond du Lac County has had as a dairy center. He bred Ayrshire cattle, because he believed them superior to any other breed for dairy purposes. He raised fine horses, importing one of the first Clydesdale stallions ever owned in the county.

Aside from his business and farm interests Mr. Hazen found time to devote to public affairs and for a decade or more was regarded as one of the great leaders in Wisconsin agriculture. He was instrumental in organizing the first dairy board in Fond du Lac County which was on March 10, 1869. He served as the first president of the board, and in 1872 when the state dairy association was formed Mr. Hazen was chosen president in which office he served for three years. He was for many years president of the Fond du Lac agricultural Society. In 1885 he was elected to the assembly from the first Fond du Lac County district. He served on several important committees having to do with agricultural thought, the most important of which was the committee having charge of the bill establishing farmers' institutes. Mr. Hazen introduced the bill creating a law to provide protection for animals from contagious disease and established the state veterinarian's department. He is dead some twenty years, but his memory will live as one of the men who glimpsed the future of the dairying industry of Wisconsin.

Increasing the Test with Cottonseed Meal

A. C. McCANDLISH, IOWA

EVERYONE connected with the dairy business has heard of the great results obtained in increasing the butterfat in milk by feeding cows heavily on cottonseed meal. The question has assumed considerable proportions in connection with official and semi-official testing. It is well known that many feeders give large amounts of cottonseed to their cows when the tester is around, but the legitimacy or ultimate value of this practice will not be discussed here.

This report simply covers preliminary work conducted by the Dairy Husbandry Section of Iowa State College in which no attempt was made to feed cottonseed meal in large quantities. The main object was to determine the reasons for any changes in the composition of the milk which might occur on the sudden addition of cottonseed meal to rations as a substitute for different types of feeds.

Earlier Work

In reviewing the work already done with cottonseed meal it was found that no experiments of exactly the same type as those mentioned here have been reported. No two of the pieces of work which have been previously completed can be easily compared directly as the conditions under which they were conducted varied greatly.

From the 113 feeding trials we have reviewed, a few general deductions can possibly be made. A summary of these trials shows the chances are two for an increase, one for no change, and one for a decrease in the fat content of the milk when high protein feeds were added to the regular ration. When the usual ration contained a general grain mixture the chances for an increase in fat percentage in the milk when a high protein feed was added was about equal to the chance that there would be no change and when a high protein feed was added to a high protein mixture the chances for an increase or a decrease were about even.

All of the individual high protein feeds which were used in these trials need not be considered in detail. It may be said, however, that the general trend of the results with cottonseed meal and linseed meal is about the same as for the whole group of feeds, though in the few cases where the cottonseed and linseed meals were compared directly there was a tendency for the former to give the higher butterfat content.

In the feeding trial at the Iowa State College the periods of feeding were of short duration—from two to seven days, so that quick c...es in the fat content of the milk, if any occurred, could be detected.

Cottonseed in Place of Oil Meal and Bran

Six cows were used in a test in which cottonseed meal replaced oil meal and bran. The total duration of the experiment was 33 days. The cows were being handled with the regular milking herd and were on a winter ration of corn silage and alfalfa hay which were fed according to the live weights of the animals. The basal grain ration which was fed during the check periods consisted of 2 parts of cracked corn, 2 parts of ground oats, 2 parts of wheat bran, and 1 part of linseed oil meal by weight. The amount of the grain mixture fed was proportioned to the production of the cows.

During the first experimental period the oil meal was replaced by an equal weight of cottonseed meal; in the second experimental period the bran was taken out and the cottonseed added; and in the third, the cottonseed meal replaced both the oil meal and bran. As a consequence the cows received from 3 to 6 lbs. of cottonseed meal daily. Each experimental period was preceded and followed by a check period and the first part of the check following the feeding of the cottonseed meal was used as a transition to note the rapidity with which the cows returned to normal.

The average daily production of milk and butterfat and the fat percentage during each experimental period and its accompanying transition period was compared with the average for the check periods preceding and following it.

When oil meal was replaced by an equal weight of cottonseed meal little change was produced during the period of cottonseed feeding. In the next few days, when the cows were back on their usual ration, the fat content of the milk increased 5 per cent but, because the milk yield was reduced 3 per cent, the total amount of fat was only slightly influenced.

A 6 per cent increase in milk but little change in the fat content resulted when bran was taken out of the ration and cottonseed meal put in in equal amount.

There were only very small changes in milk and fat yields when cottonseed meal replaced both the oil meal and bran.

These results indicate that the substitution of cottonseed meal for oil meal and bran does not bring about marked changes in the fat content of the milk and that the changes which do occur do not take place immediate-

TO MEMORY DEAR

Lightly esteemed in his lifetime; so lightly, in fact, that when he developed traits of viciousness he was condemned and executed, Aaggie Cornucopia Johanna Lad Jr. 5th, for several years sire of the Minnesota University Farm Holstein herd, may be said to live again in the deeds and records of his daughters. Five daughters at the University Farm have produced in semi-official yearly test an average of 19,468 lbs. milk containing 657.2 lbs. fat.

The ability of the former University Holstein herd sire is shown by the performance (781 lbs. fat) of his highest record daughter, Facile Aaggie. She is out of a dam who three times was unable to qualify for admittance to the blue book. Only one daughter's dam had an A. R. O. record.

ly, being most evident in the period following. Wide variations in the results with the individual cows were noticeable.

Substitution of Cottonseed for Corn

In the experiment in which cottonseed meal replaced corn four cows were used for 33 days. They were on pasture and receiving soiling and in addition a basal grain ration of equal parts of cracked corn, ground oats, linseed oil meal, and wheat bran. The daily ration for each cow was 12 lbs. of this mixture. During the experimental periods the corn was replaced by an equal weight of cottonseed meal.

In the discussion of the second experiment, one cow will be left out for separate consideration as her reaction towards the cottonseed meal was absolutely different from that of the others. Considering the other three animals, it is found that when cottonseed meal took the place of corn in their ration an increase of 4 per cent in both fat content and fat yield occurred while the cottonseed meal was fed, while increases of 2 per cent in milk yield, 12 per cent in fat content, and 14 per cent in fat yield occurred in the period following. This indicates that the cottonseed meal did increase the percentage of fat in the milk yield without influencing the milk yield to a marked degree and danger of spoiling her completely as a dairy cow.

Summary of Results

From the limited work reported here we are probably justified in saying that the substitution of cottonseed meal for corn in the ration of the dairy cow will result in an increased fat percentage in the milk and that the same wide change cannot be produced by substituting cottonseed for feeds of relatively high protein content such as oil meal. Also, some cows can be thrown off feed by even limited amounts of cottonseed meal and, where cottonseed has been fed for a few days and then taken out, its readministration, after only a limited period, will tend to decrease rather than increase the fat content of the milk.

Cause of the Cottonseed Action

Finding the results produced by the sudden introduction of cottonseed meal into a ration is one thing, explaining them is another. There are a large number of probable causes for this action of cottonseed but only a few of them need be considered.

The palatability of a ration is an important factor in determining not only the amount of the ration consumed but perhaps also the efficiency with which it is utilized. So greater palatability of the feed, as a result of changes in the ration, might lead to

SANS ALOIS KATHARINE, ILLINOIS STATE CLASS CHAMPION
SENIOR TWO-YEAR-OLD JERSEY COW

OWNED BY BELSWOOD FARM ILLINOIS

that the full effect of the cottonseed was not apparent immediately after administration.

Cottonseed meal was again used in the place of corn in the ration of these cows and there were noted decreases in milk yield, fat content, and fat yield while the cottonseed meal was fed—the depression being most marked in the early part of the period. By the time the following period was reached and the cottonseed taken out of the ration, production tended to come back to normal. This shows that the readministration of cottonseed within a few days of the first period of feeding has a tendency to decrease rather than increase the fat content of the milk.

In the case of the fourth cow an entirely different set of results were obtained. She was fed only 3 lbs. of cottonseed meal and at first responded with a large increase in milk yield but a lowered fat percentage. She then went off feed, even though she was receiving feeds which should counteract the constipating effect of the cottonseed, and her milk yield was reduced by about one-half, while her fat percentage increased by a third, resulting in a total decrease of over one-fourth in her fat yield. It was, therefore, impossible to keep this cow longer on experiment without improved production. This can hardly hold true in the experiments considered, however, as cottonseed meal is relatively unpalatable when compared with the feeds for which it was substituted and in addition the amounts of the rations were under control.

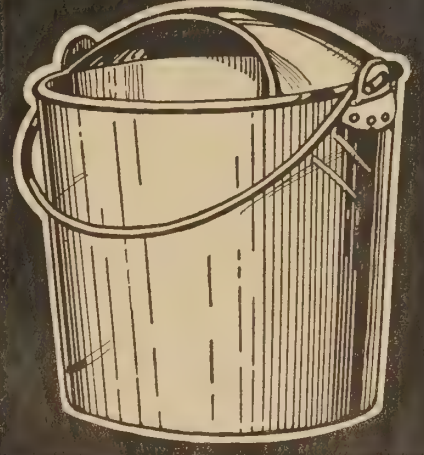
Certain feeds cause digestive disturbances and sudden or radical changes in the ration at times produce similar effects. Cottonseed meal is one of the feeds which, on account of its relatively unpalatable nature and its constipating action, may produce digestive troubles if suddenly introduced into the ration or if fed in too large amounts for too long periods of time. This effect might be presumed to have induced the increase in the fat content of the milk as digestive disturbances frequently result in a decreased milk flow and an increased percentage of fat. However, the greatest and most regular changes were produced when the cottonseed was substituted for corn, and feeds that counteract the constipating effect of cottonseed meal, namely linseed oil meal and wheat bran, were allowed to remain in the ration; and the least regular and smallest changes resulted in the substitution of cottonseed for linseed meal and bran. As a consequence, therefore, the changes

DURO SEAMLESS SANITARY MILKING PAIL

14 QT. SIZE

$2.25

This durable, sanitary milking pail is made of heavy gauge steel double tinned, bottom and sides of one piece. The hood prevents dust and dirt falling into milk when pail is held at customary angle between milker's knees.



No seams, cracks nor crevices to harbor bacteria. No loose parts; hence no expense for supplies.

14 qt. with hood $2.25 per dozen....$24.00

"Dandelion Butter Color" Is Big Prize Winner

Be sure and use Dandelion Brand Butter Color and give your butter that June golden shade which brings top prices—pleasing the eye and tempting the palate.

The High Scores of 1920

In many of the State Buttermakers' Shows, first awards were won by users of old reliable "Dandelion Brand." You can't miss by giving a trial to the butter color which helps 90% of the successful buttermakers of America.

Never gets rancid. Doesn't affect flavor.
Doesn't color the buttermilk. Leaves no sediment.
Colors more butter to the gallon.

Dandelion Brand Butter Color is purely vegetable and fully meets requirements of all Food laws—State and National. Ask your jobber for prices.

WELLS & RICHARDSON CO., Inc BURLINGTON, VERMONT

Gives Extra Arms to Farms!

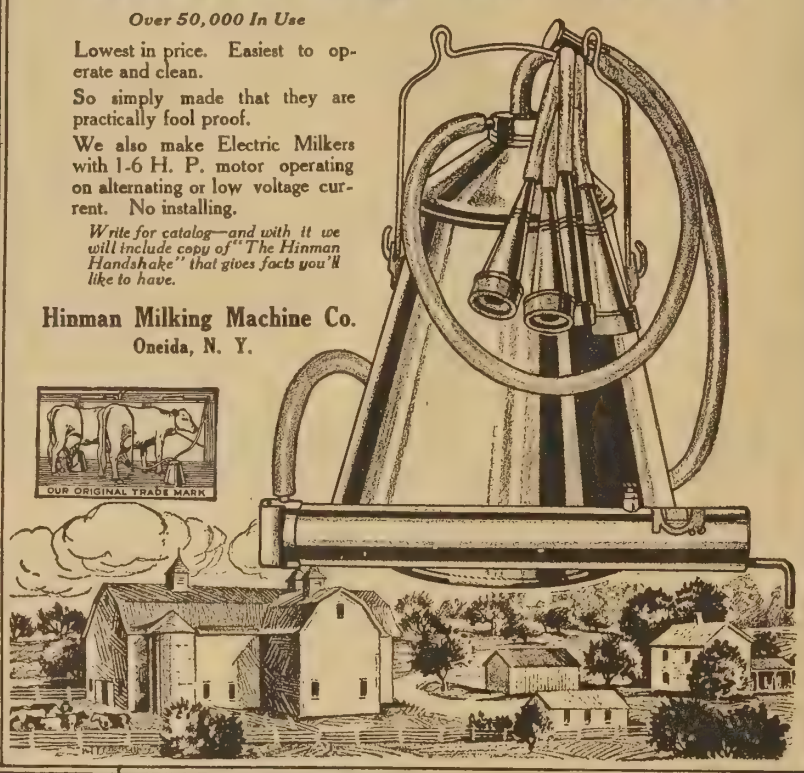
Does 3 Persons Work!

Saving two-thirds of your milking time means less help required, clean and more uniform milk —and better milk means premiums per 100 in addition to your regular checks.

All of the above will result from the use of the efficient

HINMAN MILKER

Over 50,000 In Use



Lowest in price. Easiest to operate and clean.

So simply made that they are practically fool proof.

We also make Electric Milkers with 1-6 H. P. motor operating on alternating or low voltage current. No installing.

Write for catalog—and with it we will include copy of "The Hinman Handshake" that gives facts you'll like to have.

occurring cannot be attributed directly to digestive disturbances produced by the cottonseed meal. Neither can the sudden introduction of the cottonseed meal into the ration be looked on as the cause, as it was introduced suddenly in both experiments but with different results. In the case of one cow only did digestive disturbances occur on using the cottonseed meal.

It is known that increasing the protein content of a ration increases the digestibility of both the proteins and carbohydrates present, though of course the effect is most pronounced in the case of rations originally low in protein. The extra amount of nutrients thus digested might therefore be used for the production of milk and butterfat, though excess nutrients would be used for the production of body fat and energy. This action of the protein may in part explain the results of the two experiments reported. The substitution of cottonseed for corn in the second trial increased the protein content of the ration markedly and so may have induced the increased fat content of the milk, while the replacement of oil meal and bran by cottonseed meal in the first trial was not accompanied by such a large change in the protein content of the ration and was accompanied by no marked change in the percentage of fat in the milk.

The addition of protein to the ration also increases the activity of the body cells and this might result directly or indirectly in increased milk or butterfat production. This might also account for the increased butterfat content of the milk in the second trial. The protein consumed may also have a direct stimulating action on the secretory cells of the udder and so the higher amount of protein provided in the ration might in this way account for the increased fat percentage in the milk.

There are other properties of the cottonseed meal, in addition to its protein content, which have to be taken into consideration. It is sometimes stated that the amount of fat in a ration will influence the percentage of fat in milk but, as there is no absolutely definite evidence to this effect and as the fat content of cottonseed differs so little from that of the feeds for which it was substituted in the work reported, this factor need be given little consideration.

It is recognized that some feeds possess an ability to stimulate milk secretion that is independent of their content of nutrients. Little is known of such properties, however, and, as the cottonseed was administered in two trials with quite dissimilar results, it is doubtful if the increase in fat in the milk in the second trial can be attributed to any specific, though undetermined stimulant, in cottonseed meal.

One other condition remains to be considered: when the cottonseed was given for the second or third time in each trial, there was a greater or less tendency for the fat percentage to decrease rather than increase, this being especially true in the second trial where the largest and most uniform increase was obtained on the first administration. This would point to the cottonseed acting as a stimulant rather than its direct utilization for production being responsible for the increase in butterfat in the milk, and to the fact that the cow, once she has reacted to its stimulating action, has to be rested for some time before she is again able to respond in a similar manner. Quite similar results with the use of stimulants for various purposes are common.

We are perhaps justified in concluding, therefore, that sudden increases in the protein content of a ration through the substitution of cottonseed for feeds of low protein content in the ration causes an increase in the fat content of the milk. We may conclude that this increase in fat percentage is due to a stimulation received from the cottonseed protein and that the cow must be rested for some time before she can again respond.

Dairying Thirty Years Ago

Taken from the Issue of Hoard's Dairyman of April 10, 1891

It is estimated by the food statisticians that it would require the meat of 24,000,000 steers, weighing 1,500 lbs. each, to furnish the same amount of nutriment there is in the milk of the 15,000,000 cows of the United States.

It takes 3 years' feeding to grow the steers, and when they are slaughtered they are gone; while the cows give the milk in one year, and live right on to do the same thing the next year; and finally make some beef, such as it is, when they finally "pass in their checks".

⚜

Mrs. Mary Criswell is working out the Boies-Sovereign problem. If Iowa land won't raise corn it will raise grass. She has 130 acres near Davenport and 20 Jersey cows of the "Dick" Richardson variety. From these cows in 1890 she sold 6,300 lbs. of butter for $1,512, delivering it herself to customers in Davenport, who are ready to take all she can make at 24 cents a pound the year round. It is a clear case of supply and demand.

⚜

In an agricultural school in Europe, in the Department of the Haut Saone, two cows, when treated and fed and watered the same, gave essentially the same milk. When one was confined to drinking cold water, and the other to water warmed to blood heat, it was found the cow drinking the warm water gave one-third the most milk on the same food. It is not likely she gave any less fat, but we would like to know whether she gave any more—but to determine this point does not appear to have been part of the plan.

⚜

Between hay and grass, when the winds are raw and the weather is very changeable, many a good cow is greatly injured for profitable summer use by lack of attention to her care and comfort from a careless owner who cannot see where his future money lies. A large proportion of the cows calve at this time of year, and thousands of cases of milk fever, garget, and other diseases and injuries may be prevented by good care if the owner only will. He who handles a herd of good cows at this time of year needs knowledge and energy. Poor cows tax themselves so little that they are in no danger.

Holstein cow, Maid Ormsby, and her triplet calves. This lusty family is owned R. G. Coyner, Ohio.

Association Notes

Dallas County, Iowa:—During the month of March, one cow was sold for beef and one pure-bred bull was purchased. Twenty-one cows produced over 50 lbs. of fat. Two cows, which were poorly fed last year, have changed owners and are now making a good showing with proper feed. Market milk sold for $2.90 per hundred pounds. The average test required was 3.5 per cent and 5c were paid for each point above. Feed prices: Bran, $35 per ton; oil meal $50; cottonseed meal, $48; silage, $8; alfalfa, $25; clover, $20; corn, 44c per bushel, and oats, 33c.

Empire—Osceola, Wisconsin:—During the past month three unprofitable cows were sold for beef. Most of the feed in this territory is purchased co-operatively through the Equity Society. The condensery paid 60c per pound for fat and the cheese factory 62c. Milk retailed for 12c per quart; butter for 45c per pound and cheese for 35c. Feeds sold as follows: silage, $8 per ton; alfalfa and clover hay, $20; barley, $34; oats, $28; bran, $30; oil meal, $50; cottonseed meal, $50; gluten feed, $45; hominy, $40.

Rosendale—Eldorado, Wisconsin: Market milk testing 3.34 per cent sold for $1.70 per cwt. Feed sold as follows: Gluten, $42.50 to $49 per ton; bran, $26 to $32; oil meal, $44.75 to $50; cottonseed meal, $50.

Rock Prairie, Wisconsin:—During the month of March, 12 cows were sold for beef and 7 for dairy purposes. March market milk testing 3.5 per cent sold for $2.35 per cwt. and 4c were paid for each point above. The condensery paid $1.80 per cwt. for milk. Milk retailed for 11c per quart; butter for 60c a pound; and cheese for 25—30c per pound. Bran sold for $30 per ton; corn, $18; oats, $30; cottonseed meal, $42; oil meal, $50.

Alleton—Kohlsville, Wisconsin:—This association recently finished its yearly work with an average of 9,085 lbs. milk containing 316 lbs. butterfat. During March we had 11 herds which averaged over 40 lbs. butterfat. We finished our yearly work with 66 lbs. butterfat above the average of Wisconsin associations. The increase over last year was 30 lbs. butterfat and 903 lbs. milk.

Orleans Co-operative, Indiana:—F. H. Turner & Sons have purchased a milking machine. Seven unprofitable cows were sold last month and one pure-bred Jersey bull was purchased. This association has reorganized for another year. March market milk, testing 4 per cent, was sold for $4 per cwt. The creamery paid 62½c per pound for fat. Milk retails for 10c a quart, butter for 50c a pound, and cheese for 20c a pound. Feeds sold as follows: Ground corn, $22 per ton; corn cob meal, $20; bran, $30; ground oats, $30; alfalfa hay, $30; clover hay, $18; corn silage, $8; molasses, $36.

Joe Daviess County No. 2, Illinois:—This association held its reorganization meeting March 14th. One pure-bred Holstein bull was purchased; 24 cows freshened; 9 unprofitable cows were sold. During March, market milk testing 3.6 per cent sold for $2.50 per cwt. and 4c per point above. The cheese factory paid 60½c for fat. Oil meal sold for $2.50 per cwt.; cottonseed meal, $2.40; bran, $1.50; oats, $1.85; corn, $1.40; barley, $1.60; molasses feed, $1.60; hay, $1; silage, 40c.

Emmet County, Michigan:—During March, the creamery paid 45—52c per pound for fat. Milk retails for 14c a pound and butter for 40c a pound. Prices of feeds are: Bran, $32 per ton; cottonseed meal, $42; silage, $6; hay, $20; straw, $10.

First Kane County, Illinois:—Eight pure-bred cows and 2 pure-bred sires have been purchased during the month. There seems to be the general tendency toward producing a larger supply of milk during the summer. Two new members have recently joined this association. During March market milk testing 3.5 per cent sold for $2.35 per cwt.

Worth Double Its Cost

Mr. Chandler, our tester, asked me to write what I thought the Langlade Cow Testing Association had done for me. Do I think it paid me to join it? Well, I would not take double what I paid for what I have learned through it. In the first place it taught me to feed right, and that is a big item if you expect to make any headway in the dairy business. I have learned to breed for better production, and that is the best of all. The good I have received can't be measured in dollars and cents.—STANLEY PIZAK, Wisconsin.

Milan's Light Beauty, Jersey cow owned by Jersey Crest Farms, Wisconsin. Her record of 10,182 lbs. milk, 658.2 lbs. fat makes her state champion in her class.

Progressive farmers make their own fuel and light

THE Colt Carbide Lighting-and-Cooking Plant has given the farmer the means to enjoy city lighting and city cooking conveniences, available in no other form.

This simple machine mixes carbide and water to produce gas which has been declared by Science to be the hottest fuel known for cooking and ironing. It likewise produces light that is a perfect match for sunlight.

Crushed stone and water produce fuel and light

Carbide is often referred to as "crushed stone". That's just what it looks like. And, in itself, it is equally inert and harmless. It can be stored indefinitely with perfect safety.

The simple little Colt machine brings the carbide and water together automatically. An automatic shut-off control takes care of the supply, so that you pay for just what you use.

Here, then, is the ideal fuel and light for *you*. The Colt plant is easily installed. It requires but nominal attention, asking but little in return for the marvelous service it performs.

Make *your* place stand out from the surrounding farms. Give it the manifold advantages of a Colt Carbide Lighting-and-Cooking Plant.

Send us your name and address on a postal and we will tell you all about cost and everything else you want to know. Get the facts and let *them* decide for you.

Arcady Farms

Chemical Accuracy absolutely necessary in Feeds

Prizes and Awards

awarded to the ARCADY FARMS at Lake Forest, Illinois

Highest scoring Illinois certified milk and cream at Illinois National Dairy Show.

1912—second highest scoring United States and Canada certified cream.

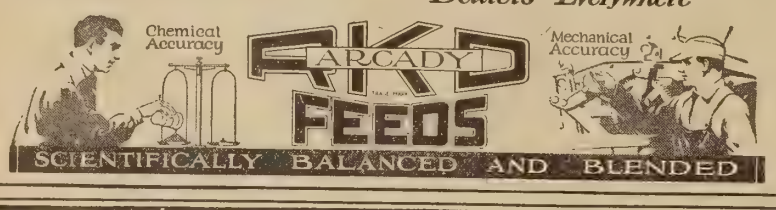
1914, 1916 and 1919—highest scoring certified milk for Illinois.

1917—Gold Medal certified milk United States and Canada.

Panama-Pacific International Exposition, honorable mention, score 92 certified milk. Second prize, score 95 certified cream.

—where only Arcady Feeds are used

Raw feed materials used for dairy feeds vary widely in food values.



The Arcady Laboratory makes careful detailed analyses of each material used in Arcady Feeds. It demands the selection of the best grade of every raw feed, and the tests made check for protein, fat, fibre, carbohydrates and physical properties.

Finished Arcady Feeds are examined with equal care and must pass the high standard of each exacting laboratory test before the chief chemist okays them.

The Arcady Chemical Laboratory controls the manufacture of Arcady Feeds, insuring accuracy and uniformity in the selection and blending of materials, producing superior feeds scientifically balanced and blended—feeds that secure the biggest results for the feeder at the least expense.

You will find Arcady Scratch and Arcady Buttermilk Egg Mash equally profitable. Write today for full information and name of local dealer.

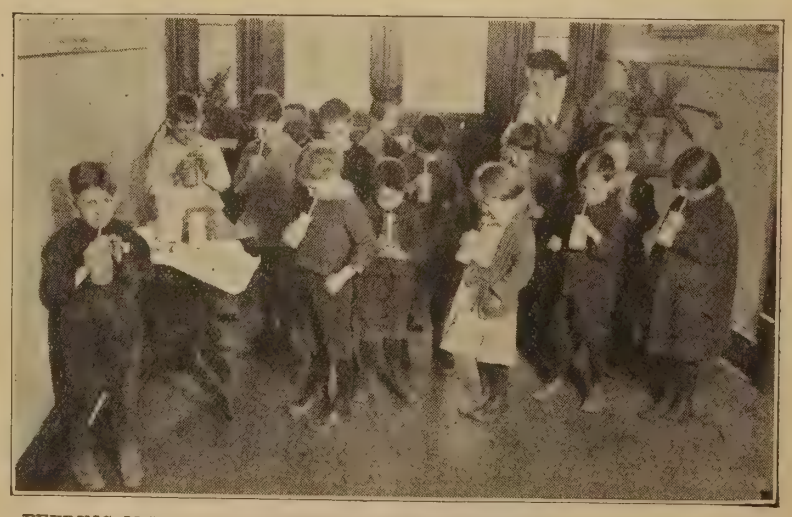
Dairy Legislation at Washington

G. N. ANGELL, WASHINGTON



THE history of the legislative session of 1921 in Washington is largely one of disappointment to dairymen of the state, for while two or three measures of interest to them got by both houses and received the governor's approval, several failed of passage, and others which were calculated to be of benefit to the industry were passed by the legislature but were vetoed by the chief executive. Chief among the measures lost was the Milk Substitute Bill which, if enacted, would have prevented the manufacture or sale in the state of any milk or butter substitute which contained any fat other than the original butterfat contained in the milk or butter. This failed by ten votes, and a consolation measure subsequently introduced, which provided for the licensing of dealers and manufacturers of milk and butter substitutes, was lost in the congestion at the end of the session. With stronger support from the state farm bureau, which was in sympathy with the milk substitute measure but which was not well enough organized to work effectively for its passage, there might have been a different story, and the dairymen will work for such support two years hence.

The recently organized Washington Holstein-Friesian Association, at its first annual meeting in March, condemned the action of the legislature on this bill and pledged itself to work for the defeat in coming elections of members who voted against it. It particularly condemned the action of Mrs. Anna K. Colwell of Snohomish County, the only woman member of the house, who surprised the bill's backers by announcing in the debate on final passage that although she was a dairyman's wife, and although she had come to Olympia with the full intention of supporting the bill, she had decided to vote against it on general principles and because she did not believe it would accomplish the end sought.

An act requiring that cattle exhibited in any state, district, or county fair or live stock show within the state be required to undergo a tuberculin test within six months prior to exhibition, and forbidding any agent of a fair or show to accept cattle without a clean bill of health, passed both houses and was approved by the governor; as did one making it optional with school districts of the first class to furnish one-half pint of milk daily to pupils under the age of 12 years; but a bill establishing tuberculin test requirements for cattle offered for sale at public auction was introduced late in the session and never came to a vote. The work of tuberculin testing by state authorities was given a boost by the appropriation of $75,000, an increase from $50,000 last year, for this purpose during the next biennium, and provision for the work up to April 1 was made in a deficiency appropriation of $10,000. A deficiency appropriation of similar size was made for the state fair, and in spite of the governor's recommendation in his annual message that this institution be abandoned, the legislature appropriated $40,000 for its support during the biennium and the governor approved. This amount is far from sufficient to make a satisfactory fair, however. Included among the items of the general appropriations bill were several which were vetoed by the governor, to the surprise and disappointment of live stock men generally throughout the state, after the legislature had adjourned. One was a $20,000 appropriation for prizes at the Western Royal Live Stock Show at Spokane, one of three big stock shows of the fall circuit. Another was a $10,000 appropriation, of the same size as that made by the 1919 legislature, for distribution among Washington exhibitors at the Pacific Northwest Live Stock Show at Portland. These were vetoed on general grounds of economy, and on the further ground that since the state fair was allowed only $40,000, it would be unfair to Washington stock men to give $10,000 to an Oregon institution.

Washington stock men have since denounced the governor's "narrow-mindedness and ignorance in the exercise of his veto powers", have charged him with breach of faith toward the agricultural interests, and have stated by resolution that his action "convicts him of such ignorance of the live stock industry as to be the source of mortification to a great agricultural state." This excoriation was based partly on the veto of a $250,000 item for the completion and equipment of the dairy building at Washington State College, which is seriously needed for the accommodation of students in dairy courses. In vetoing this item the governor commented upon the extravagance of asking for such an amount, coupled with $175,000 appropriated in 1919, for the construction of a "dairy barn". Of indirect interest to dairymen was the governor's veto of the act making federal farm loan bonds legal investments for savings banks, insurance companies, and other financial institutions within the state.

What is hoped will prove to be one of the constructive measures of the

FEEDING MILK AND BUTTERED WAFERS DURING RECESS TO THE UNDERNOURISHED CHILDREN IN THE PUBLIC SCHOOL OF WEST LAFAYETTE, IND.

Many schools are adopting this practice and the children have been found to gain in weight, vitality, and mental efficiency.

A "MILKING SHED" IN AUSTRALIA

THIS illustration is from a photograph taken on the farm of Mr. Joseph Walker of Victoria, Australia, who writes: "Our milking plant is connected up by pipes to carry the milk as it is milked by machine to the separator room. The pipes that carry milk are made of nickel and are easily taken down. After every milking we draw cold water through these pipes, then warm water together with a brush. Every three or four days the pipes are taken down and brushed out. We have used this plant for four years and for the three years previous used buckets. We prefer the pipe system. It is easier to operate and there is a saving of time. Last year we had first quality cream, which shows there was no injury to the cream."

session is the new civil administrative code rushed through both houses at the insistence of the governor, under whose guidance it was prepared. This takes the reins of government out of the hands of various boards and commissions and centralizes authority in directors of departments. The new director of agriculture, E. L. French of Clarke County, is highly satisfactory to farmers generally, and his conduct of the state fair will be watched with interest.

⚜

One might paraphrase by saying that in the spring the dairyman's fancy lightly turns to thoughts of pasture. Certain it is that as the time for "turning out" approaches, with prices of feed somewhat lower, with condensery prices of milk higher than dairymen can see any excuse for their remaining, and with several new plants of the United Dairy Association of Washington approaching completion and operation, the feeling among dairymen of Western Washington, at least, is more optimistic than it has been for months. Condensery prices have made a sensational advance of 75 cents per 100 within a few weeks, and are now $2.45, and though leaders in the opposition to dairy substitutes say that the advance was made largely to influence legislation, there are few dairymen but are willing to take advantage of the situation by selling all the milk they can make.

The two big plants of the Skagit County Dairymen's Association and of the Lewis County Dairymen's Association, subsidiaries of the United Dairymen, are expecting to receive milk about April 1. Both are expensive plants, having been constructed during a period of high prices of materials, but a large amount of milk has been signed for each and leaders in the movement are optimistic about their chances for successful operation. Both are modern to the last degree, and both are paid for.

The Whatcom County Dairymen's Association which, during the past year has paid $20,000 for a butter factory at Lynden and has given its cream shippers dividends of three cents per pound of butterfat in addition, started operation of a new milk products plant about April 1. This association recently held an annual meeting at which 800 dairymen were present—probably the biggest meeting of the kind ever held in the state—and at which nothing but satisfaction and optimism were expressed. In Snohomish County a new agreement has been made between members of the dairymen's association and the milk distributors, under which milk prices in Everett will be based on the price set by the Seattle milk commission, with a 10-cent differential. The producers will pay the hauling costs of 25 cents per 100.

Organization work in Yakima County is continuing with the active co-operation of the farm bureau, and in Spokane County, which is also in Eastern Washington and which has no subsidiary of the United Dairymen but instead a "pure" co-operative organization known as the Inland Empire Dairymen's Association, the executives' conduct of affairs during the past few months was recently endorsed, and it was voted to continue setting aside a portion of the income in the sinking fund which is to be used in the construction of a central distributing plant and milk products factory in Spokane. There is about $4,000 already in the fund, and if it is not large enough when the time comes to build, more money will be provided by the sale of stock, several members having already promised to take $500 to $1,000 worth each. The dairymen will control their product from start to finish when the plant is completed.

National Dairy Union Financse

Balance on hand Feb. 1, 1921	$4,981.52
Total receipts	585.43
	$5,566.95
Total disbursements	$249.43
Balance on hand March 1, 1921	$5,317.52

This is to certify I have today audited the books for George Caven, treasurer of the National Dairy Union and find the receipts from Feb. 1, 1921 to Feb. 28th, 1921, to be $585.43, and the amount paid out for which he holds vouchers, the sum of $249.43, leaving a balance on hand March 1, 1921 of $5,317.52.

F. P. COLLYER, Auditor.

Once we realize that we are all one, working together for the good of all; that each of us finds his prosperity and salvation in the advancement of all, then the whole business, as well as each individual, takes a distinct step forward.—JOSEPH H. APPEL.

"The teat cup action is superior to anything else on the market." —ALVIN VOIGT.

Perfection Milks Just Like the Calf

IF you put your finger in a calf's mouth and then in the teat cup of the Perfection you won't feel a particle of difference. The gentle suction followed by a downward squeeze, followed by a period of rest is a perfect copy of the calf's action. Human hands can't duplicate the calf's milking.

Perfection's way is nature's way of milking. That's why it pleases the cow. This natural action is made possible by Perfection's downward squeeze, a patented feature not found in any other milker.

Whether you have grades or high priced pure breds your cows will like it. Most owners tell us the milk flow increases when the Perfection is used.

Not only can you milk better with the Perfection but you can milk quicker and cheaper. One man with the Perfection does the work of three hand milkers. Here's a chance to save wages and be independent of hired help. Investigate this better way of milking.

How To Investigate

Write for your free copy of our book, "What the Dairyman Wants to Know." It answers every question about milking machines.

Why Milk By Hand? Cows prefer Perfection's *natural* action.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. In case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Senator Strauss' Proposed Bill of Milk Control

HOARD'S DAIRYMAN:—A bill has just been introduced at Albany by Senator Nathan Strauss, Jr., of New York which will provide complete supervision over the milk industry in New York State by a Milk Arbitration Board of five members.

Speaking from the floor of the Senate, Senator Strauss says he has consulted all the parties interested, and in the main the bill has the approval of representatives of the Dairymen's League, the Borden Farm Products Company, and Health Commissioner Copeland of New York City, among others.

According to the New York Times, Senator Strauss said: "The board will have the right to fix milk prices for the producer, the distributor, and the consumer, but these prices must be the result of a unanimous agreement to be enforcible. The object of the arbitration board, as constituted in this bill, is to enable all factions in the milk industry to act together under government sanction on these problems which they share in common, conspicuously the problem of increasing milk consumption. When a problem is encountered on which the interests of the different factions are conflicting, for instance, the problem of price, the board will adjust these differences under government auspices in an atmosphere that will insure public good will."

"The bill, in a word, calls into being an official board on which the milk industry itself will be largely represented, and over which the people, through their Government, will have only the guiding control necessary to prevent strikes, to secure an even flow of milk at a fair price and to safeguard the public health."

The bill provides for a board of five members, one of these the State Health Commissioner, ex-officio, the others would be appointed by the Governor for four years but would be removable at his pleasure. The Governor would be obliged to select the four members from a list of three persons each submitted by the Dairymen's League, the New York Milk Conference Board, the New York State Grange, and the New York Chamber of Commerce. It is provided that the persons designated by the last named organizations must not in any way be connected with the milk industry. The members would receive no salary but receive traveling expenses. E. M. L. BLANCHER.

Estabrook Associate Bureau Chief

In the combination of the Bureau of Markets and the Bureau of Crop Estimates, in the Department of Agriculture, effective July 1, George Livingston will remain Chief and Leon M. Estabrook will become Associate Chief. The new Bureau will be known as the Bureau of Markets and Crop Estimates. Mr. Estabrook was Chief of the Bureau of Crop Estimates from 1913 until April 1st of this year when he was transferred to the Bureau of Markets as Associate Chief. N. C. Murray will hold the position of Chief of the present Bureau of Crop Estimates until July 1st.

60 Guernseys Average $230

At the Guernsey sale at West Salem, Wisconsin, March 30, sixty head of pure-breds sold for $13,780, netting the owners an average of $230. Seventy-three grades, sold that day, averaged $101.

It was estimated that about 1,000 people were in attendance at the sale and the results secured mark it as the largest and most successful sale yet held at West Salem. The highest priced individual was a two-year-old heifer consigned by W. H. Hanchett. Wm. Brandau purchased her for $465. Clifford Capener consigned a pure-bred heifer which was the second highest priced animal, going to J. H. Meyer for $405. Two grades, a heifer and a six-year-old, the former consigned by Howard Aldrich and the latter by Harry Jewett, brought $180 each.

Wheat Valuable Pasture

HOARD'S DAIRYMAN:—Necessity is the mother of invention. This is well illustrated in the use of wheat pasture in the plains states. In the early days of farming there, dry prairie grass was bountiful in fall, winter, and spring, but fences were not. Wheat fields were generally green during all this time and green feed made more milk than dry. The family milk cows as well as other stock naturally drifted to the wheat fields. Now the pasture return from fall sown wheat is counted on as a regular part of the farm income on many wheat farms.

Wheat pasture produced more cash from milk and beef and saved more herds from dissolution in 1918 possibly than ever before. There are many beginners in the pure-bred dairy and beef cattle business who would have been forced to sell recently acquired stock had not wheat pasture been abundant.

"In the fall of 1918 we planted 100 acres of wheat and 15 acres of rye," says a dairy farmer near Topeka. "We planted about two bushels of wheat to the acre. We did this with the idea that wheat would make a heavy stand so we could pasture it heavy. Most wheat planted in this locality grew very rank and you never saw such a stand. It was as heavy as blue grass pasture. We turned 80 head of pure-bred Holstein cows and heifers on it. They had pasture for three months and we produced more milk on this wheat than on any before or since; and, besides, cattle never looked better. We took them off about the first of April and the wheat we harvested averaged 22 bushels to the acre. There is no question but that wheat pasture has rye pasture skinned a mile for milk production, if you get as good a stand of wheat as you do of rye. One must be very careful in pasturing wheat and not have the cows on too long at first or it will bloat them. This is for the first day or so, then they can go on full time."

Dairymen the state over have had similar experiences. Where the pasturing is done in the fall there is not a great deal of reduction in yield of grain at harvest time. In fact, most men in central and western Kansas consider that a man is foolish not to pasture in the fall if he has anything to use that way. He is then sure of a part of the return on the planted crop. Dairymen, however, do not all find their cattle in as good shape when taken off as indicated by the one quoted above. It may be taken as a general fact that cattle giving a heavy milk flow on wheat pasture are drawing on body tissues and stored energy for the fat and will be in a weaker condition at the end of a prolonged pasture period. This in itself may not be objectionable if nourishing feed is then cheaper and easily obtained while the pasture period was one of the highest price for butterfat or milk.

Pasture experiments were conducted at the Agricultural Experiment Station at Manhattan from 1888 to 1896 to determine the effect on yield of grain and straw. At that time a theory was commonly held by growers and others that pasturing in some unexplained manner was a benefit to the wheat. The results were as follows:

	Grain bus. per A.	Straw lbs. per bu.
Fall pastured	26.15	122.8
Spring pastured	27.78	118.1
Not pastured	29.60	115.5

In these experiments the cattle were not allowed on the plots when the ground was wet nor was the wheat eaten down for a long period.

The Oklahoma Experiment Station at Stillwater also carried on five years' work with wheat pasture and likewise attempted to determine the effect of pasturing early and late on the yields of grain. There were three sets of plots used in this experiment. The plot not pastured at all averaged for five years 12.71 bushels. The plot that was classed as light pastured, cattle being removed on March 1, averaged for five years 11.63 bushels per acre, and the plot that was classed as heavy pastured averaged for five years 8.38 bushels per acre. These experiments were conducted 1903 to 1907 inclusive.

Both cattle and wheat men in the great wheat belt of central Kansas say that all the pasture obtained in the fall is clear gain and that wheat pastured before Christmas will usually make as great a yield at harvest as that not so used.

Kentucky. RALPH KENNEY.

To Increase Consumption

HOARD'S DAIRYMAN:—I would like to suggest the following marketing plan to increase consumption of dairy products in dairy communities. I would have every creamery sell cheese, have every cheese factory handle butter, and the condenseries handle both. The cheese should be made in five-pound bricks, or the American variety could come in round cakes of that size and weight. The purchasing price can be taken out of the patron's checks and this will do away with the bother of handling charge accounts and eliminate the dead beat.

Some may say that this field is covered by the retail stores. I do not find it so. The stores handle cheese that is in a good many instances dry and of poor quality. It is often exposed to flies and dust, and the prices asked run all the way up to 60c. The same must be true of the butter sold in cheese factory and condensery territory.

One creamery could contract to furnish a whole string of cheese factories with good A-1 quality butter and a cheese factory could furnish a like string of creameries.

Minnesota. GROVER E. ARBEITER.

New President of Oregon Dairymen's League

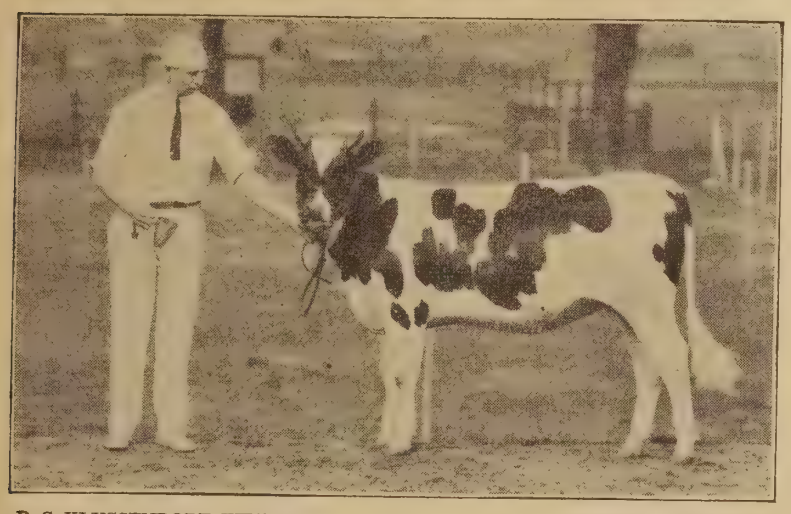
Alma D. Katz, who for nearly four years has served as president of the Oregon Dairymen's League, has resigned and Jacob Luscher, vice-president, has been selected to succeed him. The league was organized August, 1917, and since then has grown steadily, doing much to cement the dairymen of Oregon and proving a power in the community. The league has now nearly 3000 members and is operating twenty cheese factories, six butter factories, and a market milk plant. A large percentage of the growth is ascribed to Mr. Katz's leadership.

Oregon. E. K. HILL.

Many farmers are deciding to repair farm machinery because machinery prices are still very high as compared with reduced prices of farm crops.

A Little International

G. H. CLAPP, WISCONSIN



DAIRYMEN interested in the training received by students of our agricultural colleges will be pleased to know of the practical training the students of the Wisconsin College of Agriculture received through the "Little International" held in the Live Stock Pavilion at Madison in March. This is an annual affair put on by the Wisconsin Saddle and Sirloin Club composed of students interested in animal husbandry.

This affair differs from almost all other live stock shows. Animals from the college herds and flocks are fitted for show and shown by students for prizes which are awarded not on the individuality of the animal but on the improvement the student has made on the animal and the ability he displays in showing his animal in the ring.

Dairy cattle play an important part in this Little International. The animals are judged before any work is done on them and then again the day of the show. Most of the students have had no chance before to learn how to fit animals for show or sale. This event gives them the opportunity to learn how to fit animals for show or sale. This event gives them the opportunity to learn how by actual practice.

One well-known Guernsey breeder at the show this year enthusiastically declared, "A show of this kind where the students actually fit the cattle for show and handle them in the show ring is a wonderfully fine thing. It is worth more to students than a week in the class room."

Training in managing shows is another educational result. Students have charge of the entire show. There are men in charge of each class of stock and also of each breed.

R. C. KLUSSENDORF, WINNER OF THE SILVER CUP AWARDED TO STUDENT DISPLAYING MOST ABILITY IN SHOWING HIS ANIMAL IN THE RING

J. C. NISBET AND D. A. BRACE, WINNERS OF THE GRAND CHAMPION CUP WITH THE AYRSHIRE BULL, SUBSTANTIAL OF HIGHLAND

They get good experience in handling such work.

The dairy cattle department in charge of L. E. Murphy was a big feature of the show. About sixty animals from the College herd were shown. Many prizes were offered by breed and other organizations which loaned their support to the show.

Two weeks before the show the exhibitors were to be found at the dairy barn at all hours, washing and clipping their entries, blanketing them, polishing horns, and trimming feet. As the day of the show drew near, the barn became the scene of wholesale show preparation. Hides were oiled, horns and feet were given finishing touches. The results were animals in a condition to do credit to an experienced show man. In some cases mistakes were made but by these mistakes the students learned.

Saturday afternoon in the large class room at the dairy barn all entries were passed on by a committee of judges, Professor R. S. Hulce, A. J. Cramer, and J. M. Alderson. Competition was keen in all classes, especially so in the breed championship classes. The silver cup for the grand champion dairy animal was won by J. C. Nisbet and D. A. Brace showing the aged Ayrshire bull, Substantial of Highland. Their good work in fitting this bull brought them in prizes the grand champion ribbon, a bull staff, a bronze medal, and the silver loving cup.

A feature of the afternoon was the competition for the silver loving cup to be awarded to the man showing the greatest ability in showing an animal of any class. This brought together in the arena an unusual line-up—a Percheron stallion shown by the best showman in the horse department, a Hampshire lamb, a Poland-China boar, a Shorthorn cow, and a Holstein heifer, each shown by student exhibitors showing the greatest ability in the respective departments in showing their animal to the best advantage in the ring. The final decision awarded the prize to R. C. Klussendorf showing the Holstein heifer.

The dairy cattle took a prominent part in the evening horse show also. A parade of Holsteins, Guernseys, Jerseys, Ayrshires, and Brown Swiss, each animal led by its exhibitor in a white dairyman's suit, concluded the dairymen's activities.

Exhibitors and managers alike feel that they have acquired valuable experience from the Little International of 1921, experience they could not get in the class room and training which can be applied after leaving school.

First Step in Improving a Dairy Herd

JOHN BOWER, MINNESOTA

THE first step in the improvement of live stock on the farm is a dissatisfaction with what you have. So long as a farmer is content to milk any old cow, housed in any old place, fed any old way, bred to a bull of no selection, one can not expect any step forward. Are you content with what you have? Do you milk cows only because the cows are yours, because it is part of the farm work? Are your cows better than they were a year ago, than they were ten, twenty years ago? If they are not, there is something radically wrong with you, not with the cows.

You use the binder, an improvement over the reaper, as the reaper was over the cradle. You use the gas engine to pump your water, surely an improvement over working the pump handle. You use the pressed seed drill, an improvement over hand sowing. You use the threshing machine, a wonderful improvement over the flail. Some use the tractor and believe it an improvement over the horse. Most readers use the auto, without doubt an improvement over the ox-cart. So far as the cow goes, we acknowledge it is a lamentable fact that many of us are still in the ox-cart stage of cow development. And the fault is ours, not the cows. Never forget that. If, after a life time on the farm, our herd of cows does not produce milk in greater volume, and at a lower cost than that with which we started, then we stand convicted as non-progressive, out of touch with the forward movement going on all about us and upon whose activities we so much depend in the development of other things for our use and the benefit of ourself and family.

Children of Dissatisfaction

The automobile, the drill, the threshing machine, the gas engine, electric driven machinery, all are the result of constant changes brought about by divine inspired dissatisfaction, by the ever-present, constant pressure for improvement which seems to be a component part in the makeup of all. The pure-bred cow has a like origin. For years and years some few men, gradually increasing in numbers and ability, have sought successfully, and unsuccessfully, too, sometimes, to improve the economic productivity of the dairy animal. While the engineer has been measuring in meters and centimeters, the cowman has been measuring in pounds and ounces. While the engineer has used the electric crane and electric magnet the cowman has used the Babcock test and scale, whose lifting power has proven of inestimable value in improving the yield and decreasing the cost of dairy products. Can we not see that it is as much to our interest to use good dairy blood as it is to use those other time saving and labor reducing machines? So long as we are contented with what we have we will never improve. Get a little divine discontent into our system. It will be of greater value to us than the kind the political preacher of discontent seems determined we shall have. We need better cows; let us set about to get them.

One reason, perhaps, why we have not paid enough attention to improvement in our own herds is that these other things have been pressed on us by a multiplicity of agents, by the press, and the paid agent of the maker. Then, too, if you used a cradle when you could afford a self-binder, your neighbors might think you were lacking in the "upper story", that you were without brains. The inexorable pressure of public opinion and pride of family has induced you to buy an automobile when perhaps your best judgment was clamoring for a decision in favor of a pure-bred bull of one of the well known dairy breeds.

Good Breeding More Necessary Than Ever

Now, more than ever, is there a need for the introduction of good blood. Times change. As farmers we are clamoring for cost of production plus a reasonable profit. We are entitled to it. But surely no one will concede that we have a right to this, irrespective of the kind of tools we keep or the methods we use. If we milk what one speaker calls "female steers", cows, whose natural instinct to give milk at all seems almost lost, cows fed without regard to economy or efficiency, we can hardly expect to have the consuming public tamely submit to payment of prices to cover such methods. Further, we surely have not the face to ask it. Lower prices ought to stimulate economical production.

Change not Costly

Nor is it so costly to change. By the use of a pure-bred bull one can change the whole character of the herd in a few years. One must first realize the need of a change. Having done that, the next step is the selection of breed and the purchase of a sire from a high producing dam. If even that is beyond your pocketbook, there is the "bull association" where the cost is not any greater than the present system of letting things slide. But to dream about it, to talk about it, to discuss it, will not get anywhere. Dissatisfaction alone is not enough. All these things must be crystalized into action. Action alone counts. Let us do it now. There is no better time.

It's good to boost for a spring clean-up of the whole community; but its better to see that the place is kept clean the year 'round.

Those who go to bed with the chickens and get up with the lark don't need daylight saving laws.

EDITORIAL COMMENT

CLOVER—TIMOTHY MIXTURES

In the purchase of clover-timothy seed mixtures there is opportunity for cheating, for a 100-lb. mixture containing 99 lbs. of timothy seed and 1 lb. of clover would be a clover-timothy mixture, but it would not be of the right proportion for seeding purposes. Clover seed is more expensive than timothy seed and an additional price may be obtained for a mixture containing clover and timothy. When this extra price is paid, the purchaser has the right to expect the mixture of seed suitable for sowing and in order to have this assurance it is well to purchase from seed houses known to be reliable. The purchaser should be advised as to the proportions of the mixture and that he is getting a good quality of seed.

RAWL RESIGNS

B. H. Rawl, who has been Chief of the Dairy Division since 1909 and since 1918 Assistant Chief of the Bureau of Animal Industry, has tendered his resignation to take effect May 1. The dairy industry loses the services of a conscientious and capable official. Mr. Rawl has thrown himself into the work of the Dairy Division with an earnestness and an understanding of what was necessary for the proper development of the dairy industry. He has rendered a service highly commendable to himself and of large value to the dairy industry. It is unfortunate that our government has failed to recognize the service of such men and to compensate them adequately that they may continue in governmental service.

Mr. Rawl leaves to take charge of important educational and administrative work for the California Central Creameries Company, whose headquarters is at San Francisco. His education and his experiences in the Dairy Division have prepared him well to discharge his new duties. While he will devote his energy to the development of the dairy industry on the Pacific Coast, his services are lost to the dairy industry as a whole, which we consider unfortunate.

It is not possible to mention all of the investigational work for which Mr. Rawl is responsible. Since he became Chief of the Dairy Division he has established some very important experimental work which we hope will be continued. The work of the Dairy Division to improve methods of manufacturing Swiss cheese promises to become of large importance to the cheese industry. Through the use of cultures, which it has developed, the Dairy Division is able to manufacture a high percentage of fancy Swiss cheese. Before this experimental work was done, little had been accomplished to determine an exact process for the manufacture of Swiss cheese and on account of this a large percentage of Swiss cheese was classed as No. 2 which means a heavy loss to the Swiss cheese industry.

The work with Roquefort cheese has gone far enough that it may be made upon a commercial basis and the results of experimentation with sweet cream butter and milk have contributed substantially to the improvement of these products.

Mr. Rawl was instrumental in laying plans upon a sufficiently large scale to obtain definite knowledge pertaining to breeding dairy animals. Our knowledge regarding the fundamental principles of breeding is limited and, to secure information which would be of assistance to those improving dairy stock, he conceived a plan for carrying on the work so that at the end of twenty years the government will be able to furnish much valuable breeding information.

An experimental dairy farm has been established at Beltsville, Md., where field experiments, as they relate to dairy farming, are carried on together with work in animal nutrition and other practical problems pertaining to the dairy.

Several years ago Mr. Rawl established at Grove City, Pa., a dairy manufacturing plant where butter and Swiss and Roquefort cheeses are manufactured under the processes perfected by the Dairy Division. Attention has also been paid to the use of the by-products, whey and skimmilk.

In the work he has been instrumental in inaugurating in the Dairy Division and in his ability to get the men of the various departments to work together, Mr. Rawl has shown a comprehension of the requirements of the dairy industry and a keen understanding of men which is so essential for the head of a division. We need more such men in the government service and we hope our new Secretary of Agriculture will see the necessity of taking steps to provide that the service of other such men will not be lost to the government.

FILLED MILK

Filled milk is made from skimmilk and cocoanut oil. The milk fat rich in growth-producing substance is taken away and cocoanut oil, which contains no growth-producing substances, is put in its place. When milk fat is eliminated the very life of the milk is extracted. Cocoanut oil and other vegetable oils do not contain this all important substance. Children and animals go blind and ultimately die if they cannot obtain in their rations any of the substance found in milk fat.

Here is what Dr. McCollum of Johns Hopkins University says: "In our studies with diets which were lacking in the peculiar growth-producing substance found abundantly in milk fat but not in vegetable fats, we invariably observed that the animals showed, after a period of five to seven weeks, a swelling of the eyelids, and a marked inflammation of the eyes. If the faulty diet was persisted in, the animals always went blind, and death followed a period of loss of weight in case the missing dietary essential was not supplied. A small supply of butterfat works like magic in causing the recovery of the eyes in such animals provided they have not gone too far and where the eyes get well, growth in the young is resumed."

These statements by Dr. McCollum are based upon investigation. He has proved conclusively that milk fat or substances like the yolk of egg, kidney fat, liver fat, or the leaves of some vegetables are essential to growth. We cannot expect the human race to turn to liver and kidney fats, to the leaves of certain vegetables, or to carrots or rutabagas for this substance when we have it so abundantly in milk and with all the other elements which are so vital and well adapted for nourishing growing children.

The old methods of formulating diets considered protein, carbohydrates, and fats, but in late years the work of Doctors McCollum, Osborn, Mendel, Funk, and others shows there is a new substance vital to health and growth. This substance is called soluble A by some scientists and a vitamine by others.

Dr. McCollum fed a group of rats at weaning time on a diet of turnips, beets, potatoes, peas, beans, round steak, wheat flour, and corn meal. At one time this would have been considered a diet that would properly nourish an animal but the investigations of Dr. McCollum show that the rats fed this ration grew about one-fourth as large as they were capable of growing had they been fed a satisfactory diet. The trouble with this diet, he says, was that it was derived wholly from seeds, tubers, roots, and muscle meat. Such a diet will never be satisfactory for the maintenance of health.

Another group of rats was fed exactly the same ration except that whole milk powder was added to it. The rats receiving this diet grew normally and to full size. The element that produced the difference in these two groups of rats was the milk fat.

Dr. McCollum further states: "Bloch, a Danish physician has recently recorded forty cases among children in the rural districts near Copenhagen who had been fed exclusively on a diet of separator skimmilk. He describes an eye trouble and says the children recovered promptly when given whole milk. A Japanese physician, Mori, recognized that animal organs such as chicken livers would cure the disease when added to the diet of these children. He also pointed out that the fats from the kidney and liver possess the same growth-promoting substance as does butterfat. Both Bloch and Mori consider the disease of the eyes as essentially a fat starvation."

Medical men have assured Dr. McCollum that they have seen many cases of children, suffering from sore eyes and swollen eyelids, whose diets were derived principally from grains.

These experiences and investigations show conclusively that milk fat contains a substance highly essential to not only growth but health and that milk is an indispensable food for the young.

The several filled milk products offered for sale are plainly labeled, advising the consumer that they contain condensed skimmilk and cocoanut oil but they do not advise the consumer that they have taken the very life out of the milk when its fat has been extracted. The labels of these filled milk products advise the use of filled milk products in the making of tapioca pudding, custard, soups, cup custards, cake filling, cream cauliflower, cream gravies, coffee, cocoa, and all dishes requiring milk, and state that they answer the cooking requirements of bottled milk.

Manufacturers of filled milk would lead mothers to feed their children this lifeless product robbed of milk fat which carries a substance necessary for growth and health. Another group would feed children oleomargarine because it is a little cheaper, wholly ignoring the development of our children. There is no use to argue that the yolk of eggs and carrots, kidney, and liver fats contain the substance soluble A the same as milk fat, for no mother is going to feed these substances to her child when she knows milk is the source of the growth-producing substance. It is the children of mothers who are not advised about this valuable substance in milk that must be protected. That is one of the duties of our government.

Night blindness has followed in Newfoundland and Labrador where people have existed largely upon fish, salt meats, raisins, and tea. When the Eskimo mother in Alaska can not get milk she seeks fish eggs to feed to her baby for fish eggs contain the substance found in milk fat.

The Supreme Court of the United States in rendering an opinion regarding filled milk says: "The constitution of the United States does not secure to any one the privilege of manufacturing and selling an article offered in such a manner as to induce purchasers to believe they are buying something which is in fact different from that which is offered for sale."

Four states have a law prohibiting the manufacture of filled milk. They are Ohio, Maryland, South Carolina, and Florida, and a similar bill has passed the House of Representatives of Pennsylvania. There is a bill in the New Jersey Legislature which, if enacted into a law, will prohibit the manufacture and selling in the state of filled milk. The Wisconsin Assembly has before it a bill to regulate the manufacture and sale of filled milk. We believe we should do more than simply try to regulate it. We should prohibit the manufacture of a food product which aims and has, to a considerable degree, taken the place of milk, our most essential food. Filled milk strikes at the very heart of our nation, the health and development of our people.

Soy Beans for Hay

Please tell me when to plant soy beans for hay, what kind of a seeder to use or how to plant, how many pounds to plant per acre, and when to cut and how to cure the hay.

Durango, Iowa. J. A. W.

There is considerable information on the subject of soy beans in our issue for March 18, 1921, but we submit the following definite replies to these several inquiries:

In order to secure the best results, soy beans should be inoculated with a proper culture. You can secure this either from your college of agriculture or from the seed concern of which you may

purchase your beans. If not practical to secure the special culture, get some soil from a field which has grown soys successfully and where the roots of the crop have shown well developed nodules. Mix this soil with the seed, half and half, and plant the soil and seed together.

Soy beans are not hard to grow. Prepare the ground as for corn and plant about the same time, or somewhat later, in rows of cultivatable distance apart. This can be done with a grain drill by stopping up some of the spouts and allowing the beans to run out in rows the desired distance apart. Sometimes soys are sown with a drill in double rows 36 inches apart. With a six-foot drill, for example, they may be planted with the two middle and two outside spouts on both ends of the drill, closing up all the rest of the holes. With special soy bean plates, obtainable for most any corn planter, the soys can be drilled 22 inches apart by straddling every other row of a 44-inch corn planter. Avoid deep planting, it is dangerous; from one inch on heavy soils to one and one-half inches on light soils is deep enough. Cultivate shallow and frequently enough to keep down the weeds, the same with corn.

Mr. Briggs prefers planting in rows even for hay. He states that with this method of seeding a bushel of seed will plant from 2½ to 3 acres, depending upon size of beans and the distance apart of the rows. If drilled in solid as grain is grown, it will require from 6 to 8 pecks of seed per acre. The hay will be of somewhat finer quality if the beans are not over 2 to 4 inches apart in the row.

If cut too early, the stems and leaves of soy beans are too succulent to cure readily. On the other hand, late cutting means coarse, woody hay —much of which will be wasted in the manger. The best results, from the standpoint of high quality and ease in curing, are secured by cutting just as the pods are forming. It is almost necessary that soy bean hay be cured in the cock. It should be allowed to wilt about a day in the swath and then should be raked up and built into small cocks to prevent too much heating. In good curing weather, it should be ready to haul in a week or less time. Shortly before hauling, the cocks should be opened up and allowed to dry out for a few hours.

A Series of Questions

1. Is skimmilk—buttermilk commonly called Bulgarian buttermilk or is it made by a different process?

2. With whole milk wholesaling at 12½ cents per quart and cream at 35 cents per pint, price considered, what should be the butterfat content of the cream?

3. What per cent should cream test for whipping purposes?

4. At the above prices, what should buttermilk and cottage cheese sell for wholesale?

5. Can you recommend to me several text books on dairy practice, herd management, and breeding, practical for the small dairyman and breeder?

6. What is considered the difference in costs in production of certified milk over "ordinary" milk? What is usually the difference in retail prices?

McAlester, Okla. J. J. S.

1. There are several different forms of buttermilk made from skimmilk, and it is only when the bulgarian culture is used that the resulting process is properly called Bulgarian buttermilk. This is a special type of lactic acid fermentation and is different from some of the other forms of lactic acid. It may or may not predominate in natural buttermilk resulting from buttermaking. Information as to methods of making the various types of buttermilks can be secured by writing the Dairy Division, U. S. Department of Agriculture, Washington, D. C., for a copy of the bulletin entitled, "Fermented Milks".

2. If the whole milk sells at 12½c per quart and tests 3.5 per cent, then cream testing about 20.2 per cent should sell at 35c per pint. This gives consideration only to the comparative butterfat values in the two products. If the skimmilk value is considered to be worth more than the extra expense of separating the cream and handling it in small quantities, then the test of the cream should be correspondingly increased. If the test of the milk is 4 per cent, then the cream should test 23 per cent in order to make a comparison upon the butterfat value. Comparisons based upon other tests of milk may be secured in the following manner: First multiply 46.33 (the number of quarts in 100 lbs. of milk) by the price per quart of milk. Divide the sum thus secured by the number of pounds of fat in 100 lbs. of milk and this will give the price per pound fat. Multiply the price per pint of cream by two in order to get its quart sale value, dividing this by the price per pound fat previously ascertained. This will give the number of pounds fat in a quart of cream. Dividing this latter figure by 2.1 (the number of pounds of cream in a quart) will give the estimated per cent of fat in cream when the comparison is based on butterfat values alone.

3. The per cent of fat in whipping cream varies in the several markets. For the very best results, the test should be 30 per cent or above, although cream that tests 20 to 25 per cent may be whipped if it is properly aged at a cool temperature and is kept cool during the whipping process. In most cases, whipping cream will ordinarily range from 25 to 30 per cent.

4. There is no practical method of setting a price on buttermilk and cottage cheese in comparison with the prices of milk and cream. Prices on these products are largely set by the old law of supply and demand and the distributor's special aptitude of disposing of these products. Information as to the prices prevailng in the various cities will be found in our monthly report of market milk prices, the last one of which appeared in our issue for March 18th.

5. In our issue for February 25th will be found a discussion of several text books on dairy farming that will be of interest. Our Circulaton Department will be pleased to quote prices on these upon request. If a special book on market milk is desired, we would suggest Parker's "The City Milk Supply". We can supply this upon receipt of its regular price, $5.00.

6. Information concerning the comparative prices of certified milk and ordinary milk will be found in the market report previously referred to. The actual costs of producing certified milk vary considerably from town to town according to the requirements of the several medical milk commissions involved and the particular desires of the producers of this milk.

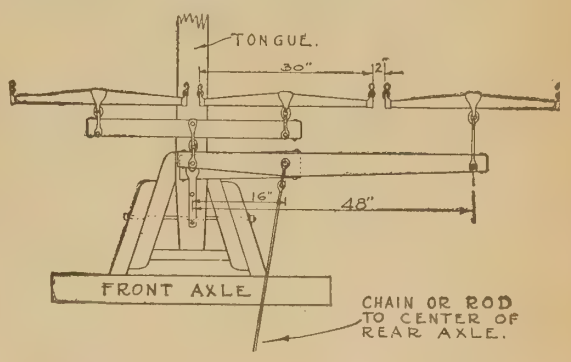
Sweet Clover for Pasture

As a result of drought last year and the fact that my farm tenant pastured my new seeding last fall, I have some apprehension as to the outcome of my clover crop this year. For the purpose of this fall pasture, in particular, am thinking of sowing sweet clover. Will you give me the best variety to plant? Could I expect either pasture or hay crop this fall? My soil is a sandy loam. Would you advise soy beans for possibly taking the place of clover hay. Expect to have plenty of corn in the silo.

Antigo, Wis. I. N. N.

The biennial white sweet clover is the variety to sow and it would be highly desirable to secure what is called scarified seed. The reason for the use of scarified seed is that sweet clover has a very resinous coat and it may be slow in germinating unless this outside coat is broken somewhat so as to permit the moisture to sprout the seed.

We would suggest seeding this sweet clover with the grain crop and either pasturing the two in early summer or harvesting the grain and then using the sweet clover for pasture during the fall months. We have seeded sweet clover in grain for several years and in a favorable season it has made a growth after the harvest of the grain so that in fall plowing it was somewhat difficult to turn it under, the sweet clover standing 10 to 15 inches high. In such a season as last year, the sweet clover did not make so large a growth owing to the dry weather after harvest. Nevertheless, the ground was nicely covered and it would have made excellent pasture.



It is also possible that it will be found desirable to sow sweet clover with oats and then harvest this as hay; or, even better, would be to seed oats and Canadian field peas at the rate of one and one-half bushels each, adding to this seeding 10 lbs. of sweet clover seed. After the oats and peas are harvested as hay, under favorable conditions it would be possible to secure a hay crop from the sweet clover the same year or use it for pasturage purposes in the fall. It would be well not to pasture the sweet clover too closely in case it is desired to make use of it for hay the following year. We would call attention to the suggestion made on page 457 of our issue for April 1 concerning the seeding of vetch. One of our recent issues contained an excellent discussion of the growing of soy beans for hay, as well as for other purposes. Unless this seed can be purchased at a satisfactory price, we question whether the returns will be quite at good as they will from oats and peas, as previously suggested. It is doubtful whether the tonnage per acre will be as great, in addition to which there is some difficulty in curing the hay properly. The soy bean hay will be of a higher protein content than the oats and pea hay, but the latter will be found an excellent substitute for clover.

A Three-horse Evener

Please give me a sketch of a three-horse evener that can be used on a two-horse wagon.

Winfield, Pa. S. M. T.

The following drawing was supplied by F. W. Duffee of the Department of Engineering of the Wisconsin College of Agriculture:

This three-horse hitch for a two-horse wagon uses 30-inch singletrees, with two inches between ends of singletrees. It may be reversed so as to put two horses on the left of tongue if desired. It will ordinarily be desirable to purchase a ready-made evener from the local dealer, the manufacturer, or the catalog house.

Removing Hair From Hide

Please tell me how to make the hair on a beef hide slip and how to make leather out of it. I have a beef hide here all dried but I don't know how to make the hair come off.

Glenwood City, Wis. T. M.

The following process for removing hair from a hide is taken from the Scientific American Cyclopedia:

1. Make a dilute solution of ammonia and sulphurous acid and place the hides in it. Coat woolly hides on the flesh side with a paste made of potter's clay and the above solution. The salts of ammonia may be used.

2. Thick skins are allowed to sweat, that is, they are rubbed on the fleshy side with common salt or saturated with wood vinegar and exposed at ordinary or higher temperature to moisture; this causes a slight or more pronounced putrefaction and the hair can then be removed with scraping knives. Thinner skins are placed in pits with lime or sulphide of sodium; very delicate skins are coated wth rusma, sulphate of calcium, or gas lime. Rusma is a salve-like mixture of 1 part of orpiment (yellow sulphide of arsenic) and 2 to 3 parts of lime. The preparation last described is poisonous.

Sweet Silage from Immature Corn

The unseasonable weather this winter rather favors anticipation and as we have had only two crops of mature corn in this section during the past years, the question uppermost in the minds of the dairymen here is: Have we any chance of a mature crop of corn this season, and if not is there any way to prevent silage from immature corn becoming sour and moldy?

Wausau, Wis. D. S.

There is no efficient method of handling an immature corn crop so as to avoid the making of rather sour silage. There is no reason, however, why this corn should mold in the silo. As a matter of fact, we would expect less mold in silage made from immature corn than when the corn is too dry.

The practice is sometimes followed of letting the frost touch the immature crop, then cutting it and allowing it to lie on the ground in good curing weather for two or three days. It will then dry out somewhat, but we would hesitate to recommend this method of handling. Possibly this corn might be put up in small shocks so that it would air out somewhat and then ensiled when it is thought a sufficient amount of moisture has evaporated.

Possibly the best procedure is to plant those varieties of corn that are most likely to mature in your section. We anticipate that the Golden Glow would, perhaps, meet these conditions although the smut nose flint or other varieties may be better adapted to Marathon County.

DAIRY MARKET NEWS

March Milk Prices

(From Report by U. S. Bureau of Markets

Table I represents a combination of the net prices received during March by producers for fluid milk (test 3.5%) f. o. b. local shipping point or distributer's plant:

Table I—Producers' Prices by Geographic Sections

Sections	Range of prices per cwt.	Comparison of average prices 1921 Feb.	1921 Mar.	1920 Mar.
United States	$1.65—4.39	$2.90	$2.62	$3.56
New England	2.21—4.39	3.62	3.31	4.07
Middle Atlantic	2.10—3.57	2.81	2.42	3.56

Burlington, Vt.	3.00	.13
Richmond, Va.	4.30—4.65	.14—.15
Seattle, Wash.	2.80	.13
Spokane, Wash.	3.25	.14—.15
Wheeling, W. Va.	3.20	.16
Milwaukee, Wis.	2.30	.10

The prices quoted for producers are for milk testing 3.5 per cent and delivered f. o. b. city, from which must be deducted the various transportation costs in order to get the actual price paid the producer at his railway station. In certain cities the prices given apply only to that portion which is considered as the producers' average production, the surplus being handled either by the producers' association or the dealers at somewhat lower prices. Detailed information as to the selling arrangements between producers and dealers in various markets may be secured by writing Division of Dairy Products, Bureau of Markets, Washington, D. C.

The prices given in Table II have been compiled on the comparative basis of milk testing 3.5% fat, different cities varying from 3% to 4% as the basic fat requirement on which prices are fixed. Certain markets pay on a straight price per pound fat, but most of them set a price per hundred pounds milk of a certain test and then add to or deduct from this price a certain number of cents for each one-tenth per cent in test above or below the basic test. The most usual allowance is from 3 to 5 cents for each one-tenth per cent or "point" as usually called.

The prices paid by consumers given in Table II are for average testing milk delivered in quart bottles. It is the grade of milk most generally sold in these cities and in nearly all cases is for pasteurized milk.

To reduce the prices per hundredweight, given in these tables, to either a gallon or a quart basis divide by 11.63 or 46.33 respectively.

Prices at County Shipping Stations

Prices paid during March per hundred pounds for standard grade milk (Grade B. 3.5%) at the dealers' country receiving stations or at producers' railway shipping points, as also prices f. o. b. city, are given in Table III. Prices here reported are those agreed upon by dealers and an active producers' marketing association:

Table III—March Producers' Prices Per Cwt. F. O. B. City and at Country Stations

	F. O. B. City	At dealers' country stations	
Bridgeport, Conn.		$ 2.21	81—90 mile zone New York City
Hartford, Conn.	4.14—4.22	2.77—2.85	61—70 mile zone New York City
New Haven, Conn.	4.42	4.07	21—30 mile zone New York City
Washington, D. C.	4.19		60 mile zone
Chicago, Ill.	2.93	2.35	All
Baltimore, Md.	3.46	2.33	50 mile zone
St. Louis, Mo.	2.91	2.23	33c zone (per 10 gal. can)
Newark, N. J.	2.83	2.30	201—210 mile zone, 53c rate, New York City
Trenton, N. J.	3.48	2.91	71—80 38.5c rate, N. Y. C., 51—60 Phila.
Buffalo, N. Y.		2.14	390—400 mile, or 69c rate zone, New York City
New York, N. Y.		2.34	200—210 mile, or 53c rate zone, New York City
Cleveland, Ohio	3.15	2.65	All
Cincinnati, Ohio	3.30	2.70	All
Pittsburg, Pa.	3.19	2.34	All
Philadelphia, Pa.	3.48	2.88	51—60 mile zone, Philadelphia
Harrisburg, Pa.	2.94	2.79	All
Wilkes-Barre, Pa.		2.10	201—210 mile zone, New York City

The average decline in price paid producers was 28 cents below the February price. Retail prices also came down an average of about one cent per quart. The sales by dealers increased slightly, but this was more than overcome by increased production and most markets reported a large surplus.

Retail Prices

Table IV gives for a few cities the retail prices of special milk, certified milk, cultured buttermilk, cottage cheese, and cream testing 18 to 20 per cent butterfat:

Table IV—March Retail Prices to Consumer

Citie	Special milk per quart	Certified milk per quart	Buttermilk per quart	Cottage cheese per lb.	Light cream per ½ pt.
	cents	cents	cents	cents	cents
Boston	18	25			15
New York	18	27		10	
Buffalo	14	26	9	14	20
Philadelphia	15—17	28	12	7—8	16
Cleveland		24		7—12	17
Chicago	20	32	15	15	18—20
Milwaukee	23	25	24	20	17
Minneapolis	13	25		12	14
St. Louis		23	15	16	14

New Orleans	20	30	14		18
Colorado Springs				12	11
Salt Lake City	16		7	20	15
Portland	12½	21	14	8	17
Spokane	19		15		15
San Francisco		25	15	20	21

Butter Prices for March

The butter market in March just about maintained the February average in the Chicago market, with the three large eastern markets showing a decline of nearly one cent each. The following table is compiled from the daily quotations of the U. S. Bureau of Markets and covers the average wholesale prices for March, 1920 and 1921, on 92-score butter (extras), as also the total receipts at these several markets:

	Ave. price Mar. 1921	Mar. 1920	Receipts Mar. 1921	Mar. 1920
	Cents	Cents	Tubs	Tubs
Chicago	46.65	66.06	162,606	151,976
New York	48.05	66.48	172,914	172,960
Boston	48.13	67.87	55,296	71,571
Philadelphia	48.67	67.45	51,471	45,311
Total receipts			442,287	441,818

Ninety-score butter averaged 43.29 cents for March on the Chicago market, with centralized butter at this market selling for 44.14 cents. Jobbers' prices on extras sold to retailers during March averaged 48.25 cents in Chicago and 46.83 cents in New York.

March Condensery Prices

(From report by U. S. Bureau of Markets)

Reports from manufacturers of condensed and evaporated milk indicated somewhat improved business conditions during March. The tone of the market was steadier, and a much better feeling existed. Domestic trade increased in activity and to this rather than to a foreign demand is attributed the more satisfactory situation. Some foreign orders are being taken care of right along but so far as figures are available this year's exports are running way short of last year's heavy shipments, especially on sweetened condensed milk. Exports of this class of goods during January and February 1921 amounted to but 19,700,000 pounds as compared with over 56,000,000 pounds in 1920. In the case of unsweetened evaporated milk exports were practically the same as last year. Germany continues to receive a large portion of the exports from the United States, getting over 8,000,000 pounds out of a total of 14,000,000 pounds of evaporated milk which were shipped out of the country in February. This was in addition to over 2,000,000 pounds of condensed. Cuba was shipped a larger quantity of condensed milk in February than any other single country, and for the two months the total exceeded over 6,500,000 pounds.

Manufacturers' Prices Lowered During February

In several respects the March report shows material changes. Manufacturers' selling prices covering sales of the previous month show heavy reductions. This applies especially to condensed case goods which dropped on the average about $1.60 per case to domestic trade and still more to foreign trade. Costs of raw milk for manufacturing purposes were also slightly lower, though not in the same proportion. In fact, prices paid in March were slightly higher than in February by condenseries in certain sections, particularly in the district embracing Ohio, Indiana, Illinois, Michigan, and Wisconsin, also in the northwestern states. In this connection it may be noted that in these same sections prices paid producers by milk distributors were but slightly different than the February prices as compared with an average reduction for the entire country of about 30c per cwt.

Condenseries Resume Operations

Fewer condenseries are idle now than were reported a month ago. The number of plants reporting as being in operation in March was 211, an increase over February of 40, and the number temporarily closed was reduced from 45 to 17. No factories reported handling milk for patrons' accounts. This would point to a more satisfactory situation from the manufacturers' standpoint. In this same connection stock figures also indicate a healthier condition. Total stocks on March 1, were 25% lighter than on February 1 and almost 50% lighter than March 1, 1920. Unsold stocks showed a similar reduction, and at the same time unfilled orders while not excessively large were almost double those of the previous month.

The prices quoted in Table I are those paid producers for 3.5% milk delivered at factories during March. They are based on reports made by approximately 61% of the total factories in the United States.

The manufacturers' wholesale selling prices given in Table II are based on reports made by manufacturers covering actual sales, during February, of condensed and evaporated milk delivered to jobbers, wholesale grocers, and similar buyers on basis of cash or short time credit. Foreign prices are given f. o. b. or f. a. s. point of export in section in which sales were made.

Table I—Prices Paid Producers at Condenseries During March

Geographic sections	Case and bulk goods No. of factories	Price per cwt.	Bulk goods No. of factories	Price per cwt.

Butter Markets Show Firmness After Sharp Recovery

(Report by U. S. Bureau of Markets)

Much talk had been heard of 40c extras at Chicago as an immediate possibility. The sharp decline which occurred on eastern markets, particularly New York, was a sequel to this sentiment. The equally sharp recovery which was recorded on Mar. 29 proved that such weakness was unwarranted and also that the arrival of the cargo of the "Oscar II" had been pretty thoroughly discounted. Receivers of this butter simply withheld it from the market and the shortage of domestic offerings quickly caused a recovery.

Just why fresh domestic butter should be as short at this time as it is reported to be on all markets is hard to say. Some explanation for the condition can probably be found, however, in the fact that buyers have practically been off the market for some time and have had to buy more heavily than usual when the market showed signs of advancing. Buyers have been noticeably in the habit of anticipating their wants closely on an advancing market this year.

Offerings of Danish at New York were limited all week. Prices obtained were equal to or more than prices received for best domestic. At the close of the week Danish was being held for 47—50½c on a 48½c market. Only one further cargo is expected, 6,600 casks which is now reported in at New York. New offerings are said to be on the basis of more than 50c c. i. f.

April is generally expected to be a short month. Offerings at the minute are certainly short. Unless prices are advanced so rapidly as to stop buying the market may reasonably be expected to remain good for some time.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending April 2, 1921, and the corresponding week a year ago were as follows:

	Week ending April 2 1921	1920
	Cents	Cents
New York	47.1	66.6
Chicago	45.3	63.6
Philadelphia	48.1	67.2
Boston	47.6	67.7
San Francisco	38.7	56.2

The receipts of butter at these markets were 7,958,321 lbs. as compared with 6,116,850 lbs. a year ago and 8,414,686 lbs. a week ago.

Cheese Markets Continue Weak

(Report by U. S. Bureau of Markets)

Following sharp declines averaging 2½c on the Plymouth, Wisconsin, Cheese Exchange on March 28, trading during the week ending April 2 lacked the activity which a good many dealers anticipated. On the other hand, both the wholesale distributing markets and Wisconsin primary markets remained quiet and if anything the weakness became more general. After the decline at Plymouth, numerous Wisconsin distributors put out prices which represented a fairly stiff margin over cost, but the small amount of business which resulted was evidence that buyers expected prices to seek still lower levels.

Opinion differs considerably as to the outlook for the next few weeks. At Chicago the feeling is very weak. Receipts have been only moderate, but sales have been so slow that stocks have accumulated to the point where dealers are generally free sellers and look for further declines. At New York, however, where stocks are not excessive, the active demand for held cheese has helped the general

Table II—Manufacturers' Wholesale Seling Prices (February)

Geographic sections	Sweetened condensed* Domestic	Foreign	Unsweetened evaporated† Domestic	Foreign	Sweetened condensed‡ Unskimmed	Skimmed	Unsweetened evaporated‡ Unskimmed	Skimmed

situation. Furthermore, on account of the uncertainty of developments in the immediate future, less western cheese has been shipped in. A slight increase in the make in New York State factories has been reported but this report lacks confirmation. It is known that some condenseries, which for a time were making cheese, have resumed condensing operations, and this, of course, will have some bearing on total production. Regardless of these facts, however, numerous dealers feel that if prices do not show material changes immediately an increased production later in the season will push fresh cheese lower.

The average wholesale prices on American cheese (style Twins) for the week ending April 2, 1921, and for the corresponding week a year ago were as follows:

	Week ending April 2 1921	1920
	Cents	Cents
New York	27.7	29.5
Chicago	20.8	29.3
Boston	23.8	30.5
San Francisco	21.8	28.5
Wisconsin	20.9	29.5

The total receipts of American cheese at these markets were 2,948,160 lbs. as compared with 2,984,025 lbs. a year ago, and 2,924,420 lbs. a week ago.

Cheese Prices for March

The daily quotations of the U. S. Bureau of Markets show the following average prices for American cheese (style Twins) for three large markets in March, 1921 and 1920:

	Average price March 1921	March 1920
	cents	cents
Wisconsin Boards	24.91	28.07
Chicago	24.32	27.83
New York	27.00	29.00

Longhorns averaged 25.58 cents on the Wisconsin Boards, which is about three-quarters of a cent above the price of Twins. In March a year ago, Longhorns sold for 29.88 cents.

New York Butter Market

New York City, April 5:—This is a season of abrupt changes of sentiment so far as the butter market is concerned. Less than two weeks ago, it was difficult to find an optimistic receiver in the market. There were dire predictions that butter prices would go to prewar levels in a very short time and that the market would be over laden with butter. It is now very apparent that predictions in postwar times are valueless as the bearish sentiment which prevailed at the time the quotation on extras reached the low level of 44c has now abruptly changed. Butter prices have advanced very rapidly of late and unless something unforeseen transpires values will go yet higher. Whether or not that will be to the interest of the dairy industry remains to be seen. The season of greatest production is near and with it must necessarily come marked price reductions. With sharp reactions in values, especially if price declines are very marked, producers become dissatisfied and lose interest in dairying. It would be far better if values could keep at a regular reasonable level the greater part of the year.

There are several reasons for the present trend of butter prices. In the first place, there is an abnormal consumption of butter throughout the country; secondly, domestic production is very low at present; and, thirdly, prospects of further importations of foreign butter are very remote. The reason for the increased consumption of butter is that prices are now at such levels that the average consumer feels he can afford to purchase butter for family use. Domestic production is low because of the change in sentiment regarding the future of the dairy industry which is the result of the closing down of many condensed milk factories last fall and the decline in prices of all milk products at that time. It is undoubtedly true that producers disposed of many of their cows at that time. The probability of materially curtailed butter importations is the result of heavy buying of Danish butter by England and France, and also because refrigeration facilities are inadequate on boats to properly care for large shipments of Danish butter that might be sent to this country.. There is a bare probability that butter production may be so reduced during the coming season that there will be no marked decline in butter prices.

On Monday of last week, in anticipation of the unloading of the shipment of 19,000 casks of Danish butter, extras were quoted at the low level of 44@44½c. Holders of Danish butter withdrew their stocks from sale with the result that there was a marked shortage of butter on Tuesday and the price recovered 1½c. There was no change on Wednesday in spite of the great activity on that day but on Thursday the price advanced to 48c. Since that day there have been successive advances of 1c, ½c, 2c, and ½c, respectively. There is a feeling that the upper limit has about been reached and that a reaction may materialize at any time, in spite of the existing butter shortage. Quotations at the close today were: Extras (92 score), 52c; higher scoring than extras (93 score or higher), 52½@53c; firsts (90—91 score), 50@51½c; firsts (88—89 score), 46½@49c; and seconds (83—87 score), 38@45c.

W. B. LIVERANCE.

Dairy Markets

MILWAUKEE, Wis., April 8—Butter—Creamery, tubs, 48c; prints, 49c; extra firsts, 44@46c; firsts, 40@42c.

Eggs—Miscellaneous receipts, country candled, cases included, 23c; cases returned, 22c; seconds, 19@20c; checks, 18@19c.

Cheese—Twins, 20@21c; Daisies, 21@22c; Young Americas, 22@23c; Longhorns, 22@23c; Brick, 19@20c; Limburger, 27@28c; Swiss, loaf, 48@50c; block, 30@31c.

CHICAGO, April 8—Butter—Creamery, extras, 46c; standards, 44c; dairy firsts, 43@47c; seconds, 32@40c.

Eggs—Ordinary, 20@21c; firsts, 23½@24c.

Cheese—Twins, 24c; Young Americas, 25c.

PHILADELPHIA, April 8—Eggs—Lower; nearby firsts, 28c; do current receipts, 27c; western extra firsts, 27@27½c; do firsts, 25@26½c; fancy selected packed, 36@37c.

Cheese—Easier; New York whole milk, fancy flat, hold, 27½@28½c; Longhorns, fresh and held, 25½@26½c.

Butter unchanged.

Milk is good for adults as well as for children and babies. Yes it is. It is taking some folks a long time to learn that milk is not just a baby food.

Primrose Prices Down!

Go over these Primrose details again—then see the International Dealer

Primrose is the only cream separator with two wide-open cream outlets that are never restricted in size. The regulating screw is in the skimmilk outlet. It is easy to adjust because it works on the large volume of skimmilk instead of on the small volume of cream.

In the Primrose the oil is forced through the bearings and not just to them.

It is the only separator in which the dirty used oil is turned out automatically when new oil is poured in.

Primrose separators run easily and steadily, skim with exceeding closeness, and serve their owners reliably for many years. Direct power drive and electric motor drive equipment available. Built in four sizes with capacities ranging from 350 to 850 pounds of milk per hour.

Primrose quality may now be had at lowered prices. This is an announcement of unusual importance to every dairyman and farmer. Take advantage of Primrose lower price at the stores of the International Dealers.

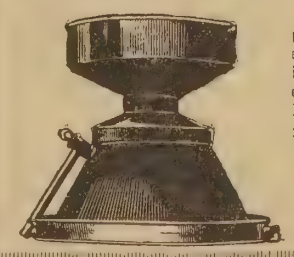
$750 After 30 Days FREE TRIAL

Without paying one cent down or obligating you in any way, we will send to you an imported Belgian Melotte Cream Separator direct to your farm on a 30-day absolutely free trial. Use it just as if it were your own machine. Put it to every conceivable test. Compare it with any or all others. We want to prove to you that it is the best separator possible to buy anywhere in the world. When convinced it is the best separator you can buy it on our easy payment plan, paying only $7.50 after thirty days free trial and small monthly payments thereafter of $7.50.

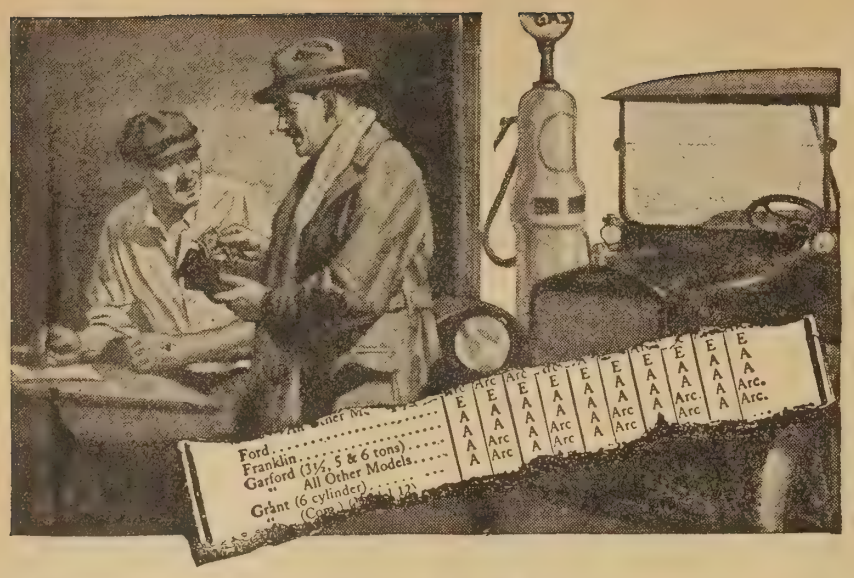


Free Book! Send today for Free Separator Book containing full description of this wonderful separator and our 15-year guarantee and 30 Day Free Trial Offer.

Self Balancing Bowl The Belgian Melotte is the only single bearing-bowl separator ever made. It is self balancing. Positively cannot ever get out of balance. Hangs from a single bearing. Spins like a top. It skims as perfectly after 15 years use as when new.

The Melotte Separator, H. B. Babson, U. S. Mgr., 2843 W. 19th St., Dept. 9854 Chicago, Ill.

The Ideal Milk Cooler



This apparatus has been, and now is, the best low priced MILK COOLER AND AERATOR on the market—extra large cooling surface, simple, strong and durable, ice chamber easy of access—easy to clean and easy to operate—adapted to use with either ice or running water. It has been in use *more than twenty years and all improvements added to date.*

Greater Ford Economy

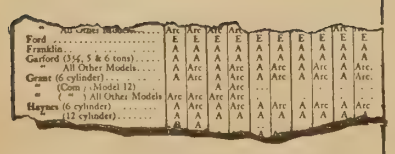
—how secured through Gargoyle Mobiloil "E"

THIS is about saving dollars and cents on your Ford car.

You bought your Ford car for service and economy. Are you getting both in the fullest possible measure?

Do you want better service and greater economy? Draw off your old oil and refill with Gargoyle Mobiloil "E." Then you will find

—*new freedom from carbon.* For the carbon of Gargoyle Mobiloil "E" is a light, dry ash, practically all of which is expelled through the exhaust.



—*new freedom from overheating.* Yes, even on hot summer days, even after free use of low gear, even through a hard day on heavy roads.

—*new economy of gasoline and oil consumption.* Engineering tests show that the body of Gargoyle Mobiloil "E" forms the proper seal for the pistons maintaining compression and increasing power. First-time users are repeatedly surprised at the longer lasting qualities of Gargoyle Mobiloil "E," and its ability to conserve gasoline.

When changing to Gargoyle Mobiloil "E" do not flush the engine with kerosene. A part of the kerosene will remain in the splash troughs and tend to destroy the lubricating qualities of the new oil.

In the differential of your Ford use Gargoyle Mobiloil "CC" or Mobilubricant as specified by the Chart of Recommendations.

Send for our booklet, "Your Ford —Four Economies in its Operation." In writing address our nearest branch.

The Vacuum Oil Company's Chart specifies the grade of Gargoyle Mobiloils for every make and model of car. Gargoyle Mobiloil "E" is the correct grade for Fords. If you drive another make of car send for our Booklet, "Correct Lubrication."

GARGOYLE

Mobiloils

A grade for each type of motor

In buying Gargoyle Mobiloils from your dealer, it is safest to purchase in original packages. Look for the red Gargoyle on the container.

VETCHES IN THE WEST AND SOUTH

(Continued from page 527)

plowed shallow or disced for cowpeas to avoid covering the vetch seed too deep. Many farmers find that it is necessary to go over heavy growths of vetch with a disc harrow or stalk cutter before turning under.

H. G. Hastings, Georgia, says in speaking of his experience with vetch: "I consider it the cowpea of the winter for our section. The south needs three things above all others: winter cover crops to stop the washing from winter rains; soil improving crops to add the most costly plant food element, nitrogen, to the soil for the use of succeeding crops, and hay for forage making crops for our live stock to feed upon. Vetch has very satisfactorily supplied these needs on my farm."

Common vetch requires a mild, even climate. It grows well during the summer months only where the climate is cool. It will not withstand cold winter weather and can only be grown in the fall, winter, and early spring months where the winters are mild. Serious winter-killing results in most instances whenever the temperature drops below ten degrees. It is not a drouth resistant crop. The most ideal climatic conditions are found in Western Oregon and Washington where the light spring rains and the cool, moist breezes from the Pacific ocean in the early summer maintain a cool, even climate. The winters in this district are not severe and common vetch will make some growth nearly every month.

Seeding Vetch

Light loam soils, well drained, are best suited to producing vetch. In Oregon and Washington applications of sixty to seventy-five pounds of land plaster have been found to increase the yields.

Inoculation is necessary for successful growth of vetch upon land which has not previously grown the crop. Many failures of vetch are traced directly to the fact that inoculation has been overlooked.

Common vetch for hay is usually sown at the rate of one bushel of vetch and one bushel of oats per acre. If cut early for soiling purposes it will make a second crop or, as is frequently the case, the land may be replowed and planted to corn or some other cultivated crop. When grown for hay, vetch should be pastured until early in May to retard harvest until the spring rains are past.

Lighter seedings are made in the South, the rate there being about forty-five pounds per acre together with a half bushel of oats.

An increasing number of farmers are producing seed of common vetch. Richard G. Scott, county agricultural agent of Clackamas County, Oregon, reports the production of forty tons of common vetch seed and ten tons of hairy vetch seed in his district during the past year. From five to seven cents per pound was received by the producers for the common vetch seed while the seed of the hairy variety brought seventeen cents. "The yield has been from 500 to 700 lbs. per acre," he says. Larger numbers of Oregon and Washington farmers are devoting increased acreage each year to the production of vetch seed.

When grown for seed, vetch is usually sown with oats. The oats mature at the same time as the vetch and the vetch and oats may be threshed together, the seed being easy to separate. A more uniform growth is secured when the crop is in pasture until early in May, unless the soil is too wet. The rate of seeding for seed production is usually less than for forage production. Thirty pounds of vetch and twenty pounds of oats is the popular seeding rate.

Threshing the Seed

An ordinary grain thresher is used for threshing vetch but in order to avoid cutting and cracking the seed it is necessary to remove the concaves. The speed of the cylinder should be slowed down also, and a heavy blast of air applied. The expense of threshing vetch is about twice that of wheat.

Vetch is cut for seed when the lower pods are well filled and are turning brown. The lower pods furnish the best seed. The crop may be cut with a binder or as an ordinary hay crop. If the first method is followed, the vetch is shocked in large shocks containing fifteen or eighteen bundles. When cut with a mower, it is placed in very large shocks in order that the pods may not be too extensively exposed to the drying effect of the sun and wind.

Hairy vetch is much more hardy than the common type and may be grown on poorer soils. It is also more drouth resistant. It is mainly grown for hay except in orchard districts where it makes an excellent cover crop. The yield of hay is less than that of common vetch grown in Oregon and Washington, but is practically the same as yields of common vetch in the South.

The seed of hairy vetch is largely imported from Europe and because of the excessively high prices during the past few years, the acreage has been greatly reduced for purposes other than seed production.

Soiling Crop System on Basis of Ten Cows as Used in Western Oregon and Washington

Vetch plays a prominent part in all well planned cropping systems used in the Pacific Northwest.

In order to provide green feed early in the spring, many Pacific Coast dairymen sow large acreages of vetch with oats or rye.

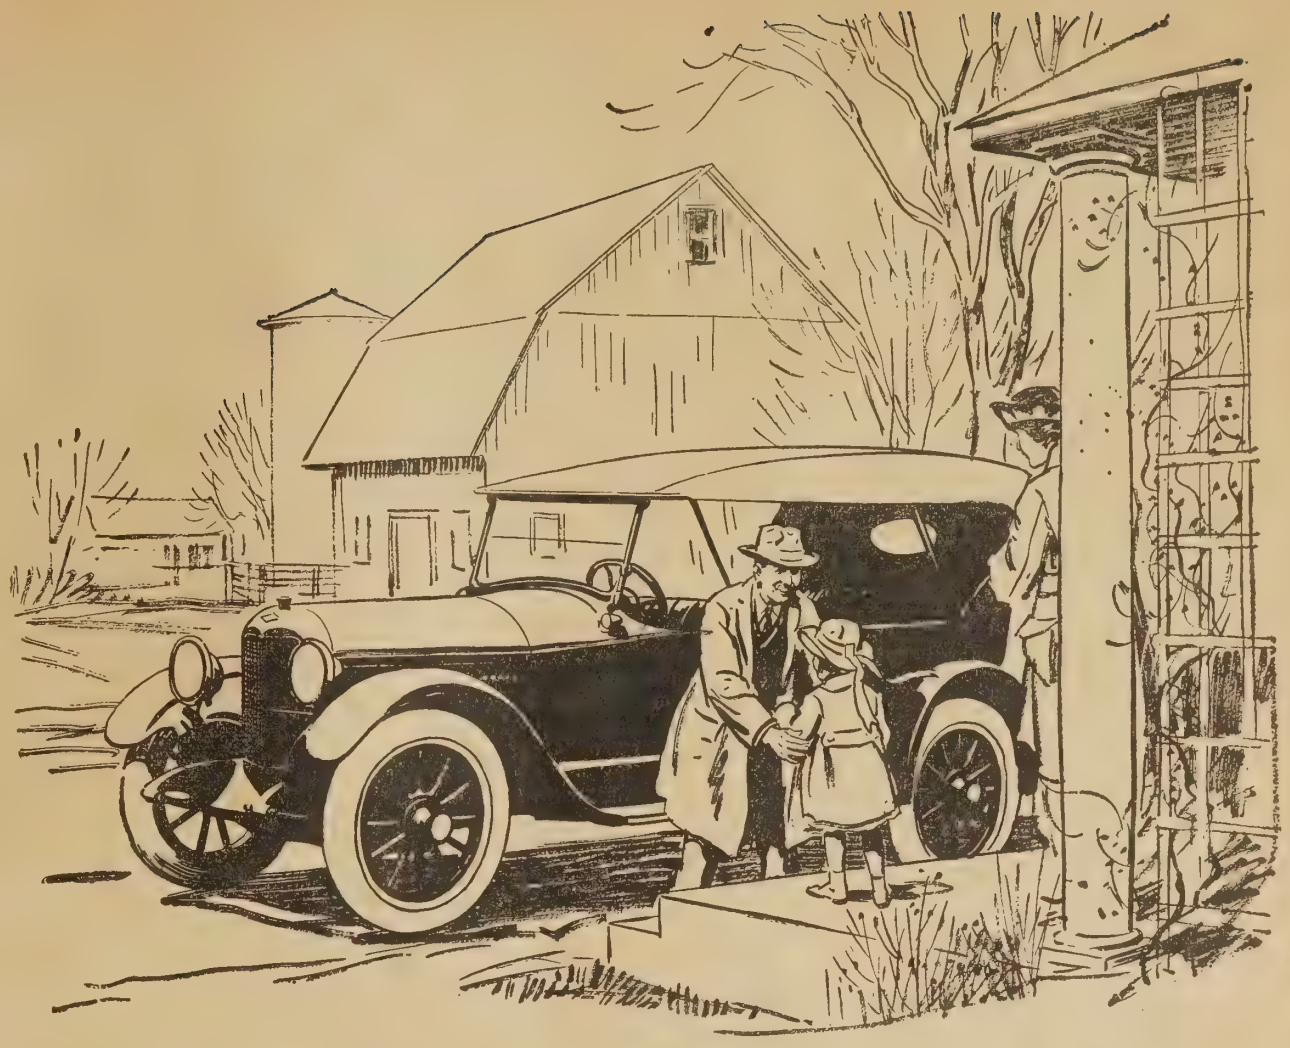
Pennsylvania Ayrshire Board Meets

HOARD'S DAIRYMAN;—"We must get Ayrshire cows out among the farmers" was the keynote of the meeting of the Board of Directors of the Pennsylvania Ayrshire Breeders' Association in Philadelphia, March 21.

"We must get the stock to real farmers at prices they can afford to pay" is the way the Secretary of the Board put it. Another man suggested that the breeders hold sacrifice sales, at which prices of good animals be cut low enough that farmers could afford to buy.

To the end that Ayrshires be more widely distributed, it was deemed best to establish a field man in Pennsylvania, and a committee was selected to choose a man for field work among farmers, county agents, and all interested in the dairy industry.

Another question discussed was that of establishing an AA grade of milk for sale in the Philadelphia market. This grade has already been established for Jersey and Guernsey milk. It was decided by the directors of the Pennsylvania Ayrshire Association that a bulletin will be sent out to all Ayrshire breeders in the state, stating the requirement of milk for the AA grade, and urging all Ayrshire breeders to meet the requirements and sell their milk as Ayrshire AA milk, the same as Jersey and Guernsey breeders are now doing. In this bulletin, every Ayrshire man will be urged to keep accounts of his costs of milk production, so that the comparative economy of Ayrshires with other breeds can be established. Other resolutions were made endorsing a state fair for Pennsylvania, and asking for relief from high railroad rates on milk, milk products, and dairy feeds.



Pennsylvania. E. A. KIRKPATRICK.

Pasture Alfalfa First Season

A test at the New Jersey Experiment Station indicates that the practice of pasturing alfalfa the first season possesses merit. On August 14, 1917, a plot of 2½ acres was seeded to alfalfa. May 10, 1918, 8 sows and 56 pigs were placed in the plot. On July 10, the sows were removed and from that time until October 10 an average of 48 pigs were continued on the alfalfa. During this time they were fed about 3 pounds of grain for each 100 pounds of live weight daily. Hay was cut three different times during this time,—on May 27, 4,180 pounds of cured hay; July 1, 4,000 pounds; and Septemeber 20, 2,720 pounds. It is recommended that under usual conditions it would be better to remove hogs not later than September 15 to permit the alfalfa to develop a good growth before winter.

In 1919 the same practice was followed, 8 sows and 59 pigs being placed in the plot April 3 and left there until the pigs were weaned, May 25th. On May 29, 2,650 pounds of cured hay was removed and throughout the entire period the stand of alfalfa appeared excellent in both vigor and uniformity.

Sentiment in New Jersey in the matter of the proper time for seeding alfalfa is changing. August was formerly preferred but at this time, especially in the northern half of the state, better results are being secured from early spring seeding. It is reported that fields in good condition, well limed and fertile, give very good success with alfalfa which is sown with wheat, rye, or oats the same as red clover seed. It is necessary that the soil be inoculated and well limed.

PAIGE

The Most Beautiful Car in America

Ride With the Champion

In every section of the nation our dealers are now conducting a special series of demonstrations with the complete line of Paige cars.

Our Daytona 6-66 model now holds the world's stock car record for speed. It is the purpose of this demonstration work to prove that any Paige car in the hands of an unprofessional driver is indeed Master of the Highway.

By proving itself the fastest car, the 6-66 has revealed qualities of endurance and strength that are beyond dispute. World's championship form is a guarantee of all-around efficiency—the best guarantee that the sporting world affords.

But these are facts that we want you to establish for yourself, and now you have an unrivalled opportunity. You have but to get in touch with our dealer and he will book you for a ride that will prove finally convincing.

Then, with an actual record of the tests, you will be in position to compare the Paige 6-66 with any other motor car—at any price—on the American market.

You will also be able to determine whether the New Series Glenbrook 6-44 is or is not the greatest dollar for dollar value in the light six field.

Surely no man could ask for a fairer or more sportsmanlike proposition.

Whether you contemplate buying a motor car or not, we very cordially invite you to ride with Paige at the first opportunity. It will prove a revelation, we believe, and a liberal education in strictly modern engineering.

PAIGE-DETROIT MOTOR CAR COMPANY, *Detroit, Michigan*

Manufacturers of Paige Motor Cars and Motor Trucks

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

Washington, April 4—In the last few days before Congress resumes work, official Washington has its interest divided between plans for tariff and revenue legislation, the maneuvers relative to foreign affairs, and presidential appointments.

Latest information is that the emergency tariff bill will be introduced in the exact form in which it went to the President late in February, and received his veto. Efforts to amend it may be made on the floor of the House, but the Ways and Means Committee is pledged to report it out in the identical form. This means a six-cent tariff on butter. There is strong probability of the bill passing and being signed.

The general tariff law is now under consideration in the Ways and Means Committee, more particularly the Republican members of that committee having been in almost constant session.

Secretary of Agriculture Wallace has made one statement on the subject of the tariff on agricultural products which has attracted as wide attention as his two general statements of general agricultural conditions. His statements, and the way they have been received, are a surprise even to his best friends. The thoroughness of his knowledge of real agricultural conditions and the soundness of his farm economics are attracting flattering comments.

His statement on the tariff calls attention to the transportation factor as another handicap under which American farm products are placed in competing with foreign products in the markets of the seaboard, and the industrial northeastern sections of the country. The increased cost of transportation on American railroads, he says, over the cheap cost of ocean rates, must be met and equalized by a tariff protection. To the difference in labor cost as between American farm wages and the peasant and women and child labor of competing countries must be added the difference in transport costs. This position is well taken, both as to the situation in which the dairy and truck farmers of the East and the grain and meat farmers of the West find themselves.

⚜

The makeup of the Republican membership on the important House committees is still not known, but the Senate committees have been about decided on, subject of course to caucus approval. The Senate Republican caucus appointed some time ago a committee on committees, and this committee has issued an advance copy of the report it will make to the caucus. The new list has some points of interest and is likely to be adopted in full. The number of Senate committees is reduced from 75 to 34. The Committee on Agriculture will have the following Republican members: Norris, chairman, succeeding Gronna; Page of Vermont, Kenyon of Iowa, Wadsworth of New York, McNary of Oregon, Capper of Kansas, (all former members) and Gooding of Idaho, Ladd of North Dakota, and Norbeck of South Dakota, new members. This gives the western states complete control of the committee, with all the members but two from west of the Mississippi river, and those two, Wadsworth and Page, chairmen of important committees and therefore more or less inactve. This is the first time that the agricultural states ever controlled this committee.

The important committee on Finance and the Interstate Commerce Committee are unchanged as to Republican members for the new session. The addition of Senators McCormick and Kellogg of Minnesota to the committee on Foreign Relations filling the vacancies caused by the election of Senator Harding to the Presidency and the elevation of Senator Fall to a place in the cabinet are of interest. Senator Warren of Wyoming and Senator Stockbridge of California and Barsum of Arizona (Senator Fall's successor) on the Education and Labor Committee are significant of a change in this committee which has been largely controlled by Progressives. The Judiciary Committee, before which the collective bargaining legislation must be fought out, and which was not very favorable to the pleas of the dairymen last session, remains almost unchanged, with Senator Knute Nelson of Minnesota as chairman, Senator Ermst, a new member, and Stockbridge of California, also a new member, are the new members succeeding Senator Fall, and Senator Kellogg who loses this assignment in order to go on Foreign Relations. The Committee on Post Offices and Post Roads, another important committee because of its control over all federal appropriations for road building and maintenance has three new members, Harreld of Oklahoma, Oddie of Nevada, and Stansfield of Oregon, replacing Pointdexter of Oregon and McCormick of Illinois, who went to other committees, and giving the Republicans one additional place on the committee. This is another committee on which westerners get practical control. Still another committee which is turned over to westerners is the committee on reclamation.

⚜

Dairy farmers may wonder why all of this is important. The answer is that each of these committees has to do with legislation which is of first importance and interest to dairy farmers. The dairy as well as general agricultural interest is affected by other legislation than direct milk, butter, and oleomargarine laws, and in a measure which needs to be studied to be clearly understood. The collective bargaining bill is a case in point. All highway legislation is another in which dairy farmers have special interest. The tariff and taxation are others. The laws which come out of Congress are shaped chiefly in these great and powerful committees. The locality from which each Senator comes, the state interests he represents, are all big outstanding factors in this game of legislation and the game is played according to these rules.

⚜

That the news of the resignation of B. H. Rawl, assistant chief of the Bureau of Animal Industry, is received with regret is evident from both the statements in farm and dairy publications, but also from letters received at the Department from many sources. There is some gossip about his successor, none to be dignified as news. In many quarters it is expected that he will be succeeded by Chief Rommel of the Beef Cattle Division, who is admittedly qualified and experienced, as well as entitled to some consideration by virtue of long service.

⚜

The situation as to a successor to Chief Alsberg of the Bureau of Chemistry, resigned, is somewhat clearer although there is no official information available. Indications point to the choice of either Dr. Johns or Dr. Brown, both former members of the staff, Dr. Johns having but recently left Washington for a position with the Standard Oil Co. laboratory service, and Dr. Brown having been with the American Sugar Refining Co. for several years since leaving the government service. Others mentioned in addition to Dr. Bigelow, mentioned last week, are Dr. Redfield of New York, and State Chemist Freary of South Dakota.

⚜

The "filled" milk situation is attracting more attention among dairymen, as reflected by the interest and activity of men in Washington who are in closer touch with nation wide dairy activities than any other one subject. Some studies are being made to determine the chief factors in the unusual decline in the volume of oleomargarine manufacture, but department officials in both Dairy Division and Bureau of Markets, and the representatives here of the National Dairy Union, the Milk Producers' and the National Dairy Products Committee, are all looking into and hearing reports from the various phases of the effort to put filled milk or synthetic milk on the markets. The effort to deliberately break down the New Jersey ice cream law and authorize the use of four per cent of vegetable fat in place of half the milk fat now required there seems to have crystalized the situation. Other states are giving attention to this in some form or other. It begins to look as if there might be a demand before long for national legislation which will do for the milk industry something along the lines of what the filled cheese law has done for the American cheese industry.

⚜

Dr. Larson and Assistant Chief Rawl are home from an inspection trip to the Grove City plant in western Pennsylvania. Considerable improvements and enlargements are reported to be in prospect at this plant and a new line of investigational work in the subject of the manufacture of evaporated milk.

⚜

Professor H. E. Van Norman of California is expected to spend some days in Washington this week, among other things to discuss with Secretary of Agriculture Wallace and Dairy Division officials, plans and prospects for the World Dairy Congress next year. He was named as chairman of the temporary committee formed at the Dairy Show for this purpose. While East he will confer with other dairy interests, and it is possible that before leaving Washington some definite decisions will be reached as to the probability of this big project materializing and as to its plans.

LIZZIE FORD, THE SYNTHETIC MILK COW

This illustration is a reproduction of a photograph which was taken during a demonstration of the possibilities of Lizzie Ford as a Synthetic Milk Cow by the engineering students of the Texas Agricultural and Mechanical College. These students have attempted to visualize the suggestion made by Mr. Henry Ford that a synthetic cow would be more efficient than the real cow.

Fake Cream and Cocoanut Oil

HOARD'S DAIRYMAN:—Fake cream dealers are getting some of their just deserts in New York City. Farmers may have thought Dr. Copeland, health officer for that city, a doubtful ally at times, but on this matter he has taken a just and firm stand. He has collected $10,000 in fines in the past few weeks from milk and cream dealers and storekeepers who have sold cocoanut oil mixtures as cream, sour cream, and milk.

Of 505 samples of "sour cream" 85 were found to contain vegetable fats. Some of these samples tested as high as 40% cocoanut oil. Of 25 samples of sweet cream four contained the substitute oil. On one day alone $5,190 in fines were collected. One dealer paid $2,000 for repeated offenses. Several others paid the maximum fine of $500. They will need close watching as with their volume of business it won't be long before they can afford to pay another fine for the same cause as the saving made by using the substitute is great.

During 1919, when the American farmer was producing honest butter in competition with natives of the Orient and African tribes and the South Sea Islanders, millions of pounds of cocoanut oil came into this country at 4½ to 11¼ cents a pound! Of course the wily manufacturers of substitutes are going to multiply in numbers like all other forms of pests when the profits are so magnificent. The prohibitive measures designed to protect the public from their activities should not be city rulings only, but a state wide, or better, a country wide protective law.

In the New York legislature there is a new section in the agricultural law, known as paragraph 37a, which would put complete effective prohibition on this form of adulteration of a valuable food product. Every farmer of that state as well as every consumer should support it, and others should see to it that their own legislatures pass similar measures.

This statement was made during one of these trials: "Originally cocoanut oil and other vegetable oils were used almost entirely in the mak-

ing of soap and candles. Now they are utilized in making soap, candles, paints, varnishes, linoleum, oil cloth, rubber substitutes, printer's ink, lubricants for machinery and food for the human stomach." This did not seem to suit the manufacturer who said that the cocoanut oil was the staff of life among the natives where it comes from. "Yes", replied Dr. Copeland, "that probably accounts for the fact that those natives never live to be over 30 years of age."

One chemist claimed that the oil had the same value as butterfat. Dr. Copeland said a child could not live on it. "Except for the vitamines the oil is the same," said the chemist. "That is a very important exception," replied the doctor.

A bill allowing ice cream containing 4% butterfat and 4% cocoanut oil has been introduced in the New Jersey senate and passed with great ease. The State Department of Health was derelict in duty enough to comment favorably on the bill. The committee of public health of the assembly strangely enough reported on it favorably also. Then the assembly got busy. Some real farmers brought out the facts of the comparative food value of the oil and of cream and a rehearing was called. If the bill gets through now it will be because the law-makers of that state do not value health as they do some other things.

From $3 to $5 a can is saved to manufacturers by the use of the oil instead of cream. As soon as the can's contents are removed, even though the can is properly labelled, the identity of the mixture is lost and the public is the victim of food adulteration. Geo. E. Hogue, State Commissioner of Agriculture, knows cream when he sees it. He was incensed to have this stuff brought to him instead of cream in a restaurant, and caused the arrest and punishment of the offender. He set a good example for all to follow.

New York. E. G. FEINT.

Canadian Ayrshire Breeders Meet

At the fifty-first annual meeting of the Canadian Ayrshire Breeders' Association in Montreal, March 23rd and 24th, very good progress during the past year was reported.

According to Secretary W. F. Stephen the membership of the association increased 209 during the past year. Within the year there were 7,633 registrations, an increase of 2,590 over the previous year. Transfers totaled 4,505, an increase of 585.

President Gilbert McMillen gave special attention in his report to the financial situation in the association. He showed that while the income has increased to over $24,000 a year, expenditures have more than kept pace so that a deficit of $450 was made during 1920. It was shown that the publication of the association's monthly paper has been very expensive, especially the French edition.

In Record of Performance work 216 cows and heifers qualified, 27 more than during 1919, bringing the present total up to 1,661. Twelve bulls qualified bringing the number of R. O. P. bulls to 78. The average production in the heifer classes has been appreciably increased.

There are now 14 local Ayrshire clubs in Canada, four having been organized since the 1920 annual meeting.

Canadian Ayrshire breeders reported with much satisfaction their progress in accredited herd work. Ayrshire breeders lead in the number of entries in Canada, there having been received 153 applications from Ayrshire breeders. President McMillen urged strongly that this system of testing be even more universally adopted by members of the association.

As a means of strengthening the finances of the association it was agreed to cut off appropriations to fairs and dairy shows which have cost $3,900 a year. It is expected that at least a part of this saving will be expended in the employment of a field man who will devote his time to promotion of the breed.

In the election of officers Mr. McMillen was re-elected president; William Hunter of Alta Crest Farms, Massachusetts, was made first vice-president; and W. F. Stephen was re-elected secretary and treasurer.

In the national sale of Ayrshires at McDonald College, March 24th, 39 head sold for an average of $291.50, 36 females averaging $289.50. The highest price paid for a bull was $500 realized by D. T. Ness for the imported two-year-old Thornhill Renewer. The highest price for a female was $925 paid by Cummings Bros. for Dalfibble White Pansy, consigned by R. R. Ness.

Calumet County, Wis., Guernsey Sale

The Guernsey breeders of Calumet County, Wis., held their first consignment sale March 31st at Chilton, selling 58 animals for an average of $217. Selling was slow and a few of the good ones sold for less than their value but, as a whole, it was quite a satisfactory first sale.

Herman Duecker topped the sale with Bernadie's Jewel, a splendid 2-year-old heifer purchased by Edmund Wieting for $500. The entire female consignment brought just short of a $250 average.

Love and Benjamin did the selling with sale manager F. E. Fox in the box.

Following is a list of those animals selling for $300 or more and buyers:

John M. Weeks, Wisconsin	
Lilly of Peony Lawn Guernsey Farm	$310
Edmund Wieting, Wisconsin	
Bernadie's Jewel	$500
Al. H. Weiting, Wisconsin	
Marcella's Queen	$300
Rola's Rosaline	385
Chas E. Patey, Wisconsin	
Count's Starlight	$300
Spring Meadow Vanity	355
M. L. Welles, Wisconsin	
Zerelda Martin	$450
O. C. Kleinhaus, Wisconsin	
Fern of Violet B.	$375
Ella Miranda of Cranmoor	370
Model May 2d	350
W. L. Breitrick, Wisconsin	
Dottie of Crystal Springs	$305
E. C. Schultz, Wisconsin	
Fair Ruth of Spring Meadow	$495
Peterson and Miller, Wisconsin	
Lady Alice of Clover Lea	$300
Dr. J. Harmeling, Wisconsin	
Fair Oaks Cherry	$360
H. H. Berger, Wisconsin	
Lucille's Virginia of River Ravine Farm	$400
Erevin Hilgendorf, Wisconsin	
Brownie of Eaton	$330
Susan of Eaton	330

What Counts in a Car?

A CAR ought to be a good investment, and to be a good investment means that you must get more out of it than you put into it.

The Overland is that kind of a car, for the service and satisfaction that it gives is out of all proportion to the little that it costs.

To the economy of light weight it adds a riding comfort hitherto found only in expensive cars.

Overland Prices Have Been Reduced
The Time Payment Plan Is Very Easy

Overland

A GOOD INVESTMENT

Have you talked with your neighbors about subscribing for Hoard's Dairyman? Why not do it now? Make up as large a club of subscribers as you can and send them in.

LOOK FOR THIS TRADE MARK WHEN YOU BUY ROOFING

It's a Repeater

A MAN buys MULE-HIDE Roofing the first time because his dealer recommends it, or he likes its looks, or because his neighbor has some.

—But he buys it the second time because through his first purchase he has had a chance to test it out, and he has found that it is the best protection at the least money for each year of service.

MULE-HIDE is an unusual combination of good looks and durability, and its service record

"NOT A KICK IN A MILLION FEET"

is no exaggeration as thousands of users will testify.

Go to your lumber dealer and ask him to show you MULE-HIDE in any of the following styles:

MULE-HIDE Smooth Finished Roofing.
MULE-HIDE Slate-Kote Roofing furnished in Green and Red Slate.
MULE-HIDE Shingle-Craft Roofing furnished in Green and Red Slate.
MULE-HIDE Individual Asphalt Shingles in Standard and Double-Thick Weights furnished in Green and Red Slate.
MULE-HIDE Four-Unit Asphalt Shingles furnished in Green and Red Slate.
SEAL-SKIN and BLACK-BEAR Waterproof Building Papers.

DON'T WAIT FOR THE COW

(Continued from page 529)

by the pasture bars told of some of the things which all the world, and the dairying world especially, ending up with the fact that his ungrateful critter of a cow never came to be milked when he called. The neighbor listened and then he jerked the reclining one to his feet and spake thus: "Don't sit down by the bars of a forty-acre lot and wait for the cow to come and be milked; get up and go after the cow."

For some few thousand years it has been rather noticeable that the men who sat around and waited for something to turn up too often ended by being turned out instead when the grand ability census was being taken. We have all seen shining examples of such men whose ambitions, if they ever had any, have seemingly ossified, and, as a result, the world is obliged to put up with one more male knocker, calamity howler, and obstructionist who lacks the guts to go out and compete man to man with his hustling neighbors. The man who wouldn't go after his cow is legion; let me refresh your memory with a pertinent illustration.

The Wait for the Cow Lodge

The man who prides himself on belonging to a group of some odd 5,000 "willful dairymen" who refuse to join the pooling plan advocated and of very near accomplishment by the Dairymen's League is a worthy and highly important member of the W. F. C., which, interpreted, stands for the national "Wait For the Cow Lodge". The motto of this lodge is "What was good enough for father is good enough for me" and, like the man who would neither beguile his cow to the bars by some grain nor make the effort to go after her, these unbelieving brothers refuse to see any good or any possibilities in a plan which was not passed upon by their fathers and grandfathers before them, or which holds any clauses with teeth to them, inserted with canny acumen and forethought for the purpose of taking care of just such slippery members as those who are refusing until the eleventh hour to be bound by them.

And "Wait For the Cow Lodge" is right, especially the lodge part. Whether a man gets it into his head that life is too short to go after the cows, theoretically, and so takes the path of least resistance which leads him to the poor house or near-stagnation, or whether he inclines to the theory that the dairy industry owes him a living as a matter of course and that he need not discommode himself when it threatens to sink—that man has the wrong creed lodged in his brain and it is mighty hard to dislodge it and set him and his brothers on the right track, headed for Profitville and Progesstown. The remaining 35,000 are finding this out as precious time flies past, and some of them are now engaged in wondering why they helped obstruct instead of help this co-operative plan as long as they did —but that is neither here nor there.

What we are keeping before us now is that the W. F. C. folks have got to be shown that, when they agree to pool their milk, they are only applying the principal which the lazy dairyman's neighbor advocated—to go after an old, tired-out business with new, fresh, timely methods instead of sitting down at the doors of the closed shipping plants and condenseries and mourning the fact that milk is too plenty in some places and not plenty enough in others; meanwhile everybody everywhere is losing millions and millions of dollars waiting for the cow to come home and be milked.

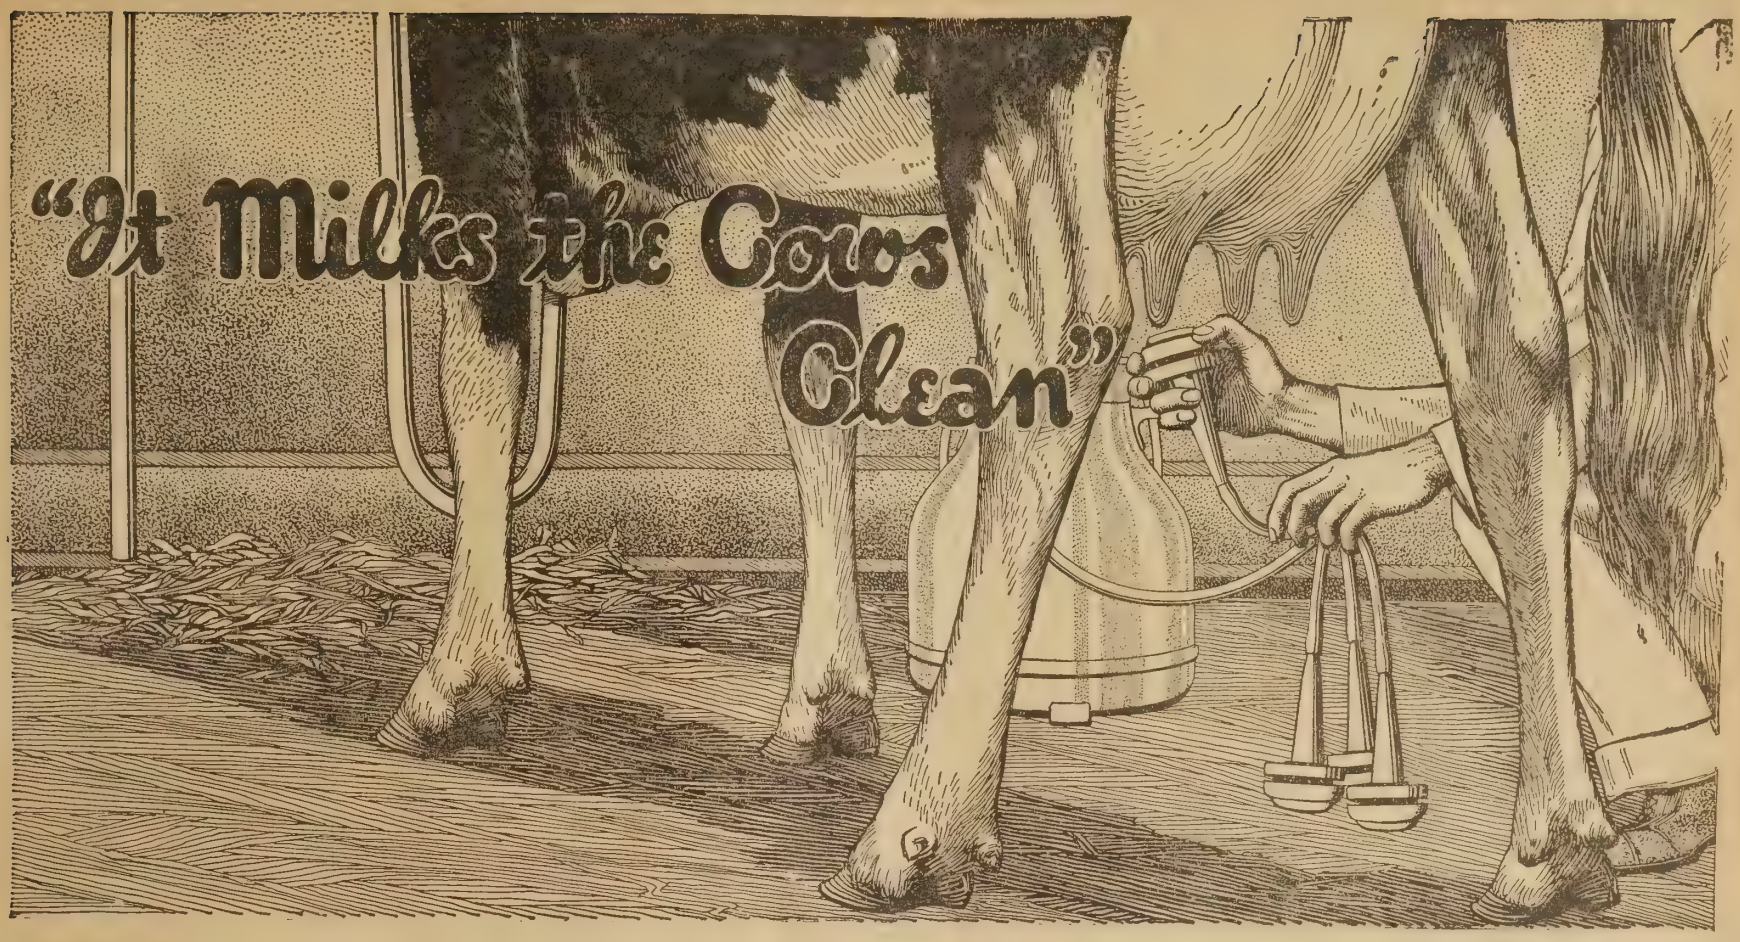
"Come, Boss! Come, Boss!"

What the pooling plan would presume to accomplish is just what Lazy Dairyman would do if he could get up ambition enough to go after his cow; it would work for every mother's son to the last ditch and last dollar and, if given permission in time, would save the pieces and patch them together and finally amalgamate 50,000 producers into one producer, to serve and to be served, and to profit and to progress as dairymen never have done before. But one man, or five thousand men, can't accomplish such a wonderful alchemy by sitting down at the pasture bars and saying, "Come, Money! Come, Money!! Come, Money!!! Why in Hades don't my milk bring what it's worth? Why don't the League do something about it, anyway? Guess the trouble is that the milk business has gone to the demnition bow-bows!"

Go After the Cows

Along comes a neighbor and hears this illustrous member of the W. F. C. Lodge bewailing his sad lot and the much sadder lot of milk. Neighbor knows that the W. F. C. man has refused to lend his support to the pooling plan, refused to sign up with the farm bureau when the latter asked for $5 for five years, and in other ways has always fallen down on public-spirited attempts at progress. He listens in silence, and he ends by jerking the discouraged one to his feet and speaking thus:

"Don't sit down outside the bars of a 75,000 organization which is dying for your aid and support and then wonder why milk is bringing a price far below cost and, in some instances, can't be sold at all. Don't wait for the cow to come and be milked; in other words, put your John Henry to the pooling plan and then see if some of your milk troubles don't dissolve and fly away. Get up and go after the cow!"



Fortunately for the world, perhaps, there aren't many men who refuse to go after their cows altogether; most of them think best to compromise in the end inasmuch as the cow would wait, particularly if she had learned her master and resembled him any, until the birds had flown and the leaves had fallen and the winter had come—before she came home.

In the years which are winging their way toward us at a nice fleet clip, there is likely to be some pretty hot competition, action, and radical results therefrom if present indications point aright. Money of late years has grown on the bushes and for the picking, jobs ditto, and everything else easy come, easy go. But a little bird has told us that the summer is on the wane and cold winter close at hand. In other words, the world has stopped jazzing and is now engaged in walking, even limping at times, meanwhile searching anxiously in its pockets for any stray coins which might have been left over from the long, glad spree.

At the Far End of Pasture

For the past few years a good many of us have only had to call the cows and home they came, with their udders heavy with richness and plenty just waiting to be "milked". But next year, even this year, the cows stubbornly remain at the far end of the pasture and the man who gets their bounty has got to go after it, has got to work for it. In every line it is the same; the milk line is no different from its contemporaries. We have got to compete as we never did before with the oleomargarines, with Europe

(Continued on page 559)

TRADE MARK

BURRELL B-L-K MILKER

"It Milks the Cows Clean"

YOU HAVE repeatedly read in our advertising the Burrell slogan, *"It Milks the Cows Clean."* It is important that you should know just what this slogan means to you.

If you have been hesitating about buying a milking machine, because you have believed that every cow would have to be stripped out by hand, your objection is removed by the Burrell Milker—*"It Milks the Cows Clean."*

With the Burrell Milker, the vacuum pull in the teat cup is greater when the milk comes with difficulty, as at the end of the milking. It is then that the teats receive the maximum suction required to secure the last of the milk. This is done without any change in the speed of pulsation, which always remains the same.

The Burrell Automatic Controller—an exclusive Burrell feature—is an efficient device by means of which a constant *balance* is maintained between the amount of milk flowing and the amount of suction in the teat cups.

When milk is flowing freely, as with an easy milker or during the main part of the milking, the suction in the teat cups is automatically decreased. When milk is flowing less freely, as with a hard milker or toward the end of the milking, the suction in the teat cup is automatically increased.

There are other exclusive Burrell features that you should know about—the Burrell Positive Relief Pulsator, the Burrell Universal Teat Cup, and the Burrell Moisture Trap.

Write today for our booklet and complete information about the Burrell Milker—*"It Milks the Cows Clean."* Tell us how many cows you milk and why you are not already milking by machine. Use the coupon below.

Breeding Shown by Jersey Records

Eighteen years of record-making under supervision of the state agricultural colleges and recorded by the American Jersey Cattle Club shows that the progress of cattle breeding is aided largely by the testing of dairy cows for production.

From 1915 to 1921 there was an average increase of four hundred and fifty-eight pounds of milk and twenty-four pounds of butterfat in the records of all cows on Register of Merit test. The exact figures for this period and for the years preceding are shown in the following table:

Period	Records accepted during period	Ave. lbs. milk	Ave. lbs. fat
1903 to 1915-incl.	3,708	7,774	414
1916	1,556	7,735	419
1917	2,077	7,962	428
1918	1909	7,964	429
1919	2,040	8,187	439
1920 (10 mos.)	4,301	8,232	438

15,591 records, all ages, average 5.35% butterfat.

The performance records of breed champions have practically doubled since Dollie's Valentine was champion of the Jersey breed in 1899, and a look through the next table gives some idea of the quickened pace in the championship division:

In the year 1920 there were 1,459 mature animals tested (cows five years old and over). These cows produced an average of 9,701 pounds of milk and 510 pounds of butterfat, so that it is safe to say that all mature Jersey cows should be capable of making 510 pounds of butterfat in a year in order to measure up to the standard set by cows in that class today.

The average for four-year-olds is 8,777 pounds of milk and 472 pounds of butterfat; three-year-olds, 8,042 pounds of milk and 441 pounds of butterfat; two-year-olds (including yearlings), 6,691 pounds of milk and 356 pounds of butterfat. The Register of Merit requirements are much lower than this, but it seems as though the average animal has a good margin to spare in its record.

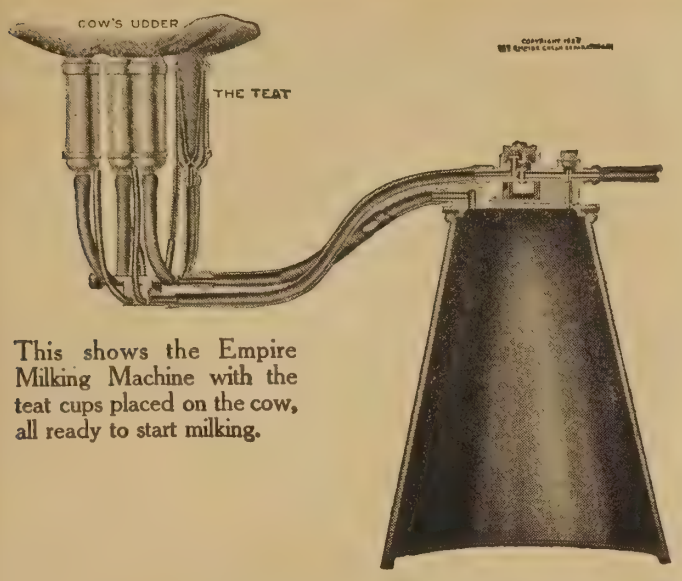
Testing of dairy cows has proved itself to be a valuable help to dairymen and breeders, as it has helped to improve production and profit as well as laying a foundation for breeding the dairy herds of tomorrow.—American Jersey Cattle Club.

Profitable Cows

To qualify for the Register of Production, animals in Wisconsin cow testing associations must produce at least a pound of fat per day for the association year. Published records show that in the first year the Register was in existence, 421 cows qualified out of a total of over 50,000 cows tested. A study of the performance of these 421 cows yields some worth while suggestions for every owner of a dairy herd.

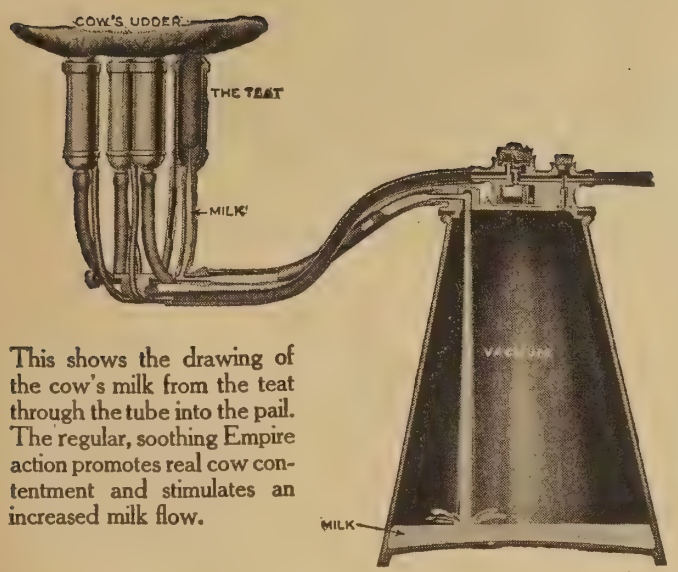
Each one of the cows which made the Register of Production was fed grain. All but five were fed silage. The records indicate that all of these cows were liberally fed. Their grain ration was made up of farm grown concentrates balanced by the addition of oil meal, cottonseed meal, or some other high protein feed.

The testers state that the most common practice in feeding is to furnish all cows in the herd the same ration regardless of production. This results in good cows receiving too little grain and in poor ones being fed too heavily which prevents high quality cows from producing at their maximum economy and results in a wastage of valuable feed with poor producers.



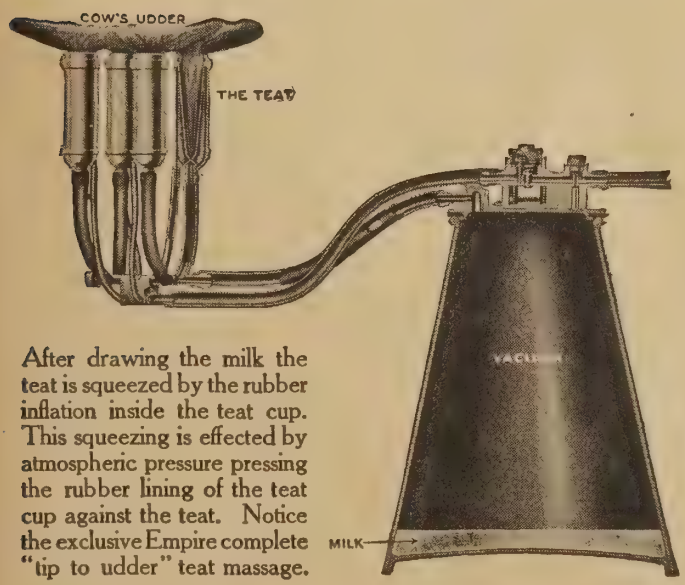
To illustrate this, the records of two grade cows kept under similar conditions and receiving very nearly the same feed are presented. Curly, aged 8, produced 8,947 pounds of milk containing 273.7 pounds of fat, in the association year. The cost of her feed was $137.50 and the return to her owner from her product, when the cost of her feed had been subtracted, was $113.76. Baldy, aged 7, produced 14,679 pounds of milk containing 594.5 pounds of fat and was given only enough more feed to make her ration cost $166.60 for the year. She returned $271.92 to her owner above her feed cost, or more than twice the net from her stable mate, Curly.

Testers state also that a very great source of loss to the dairy farmer comes from underfeeding. Especially when cows are high in price and labor and feeds are costly it is profitable to feed good cows liberally and to cull out the poor ones from the herd. This requires close attention to the production of each cow and careful study of association records.



In Circular 129 of the University of Wisconsin, A. J. Cramer and R. T. Harris, authors, make this statement from a study of data from Wisconsin associations: "Feeding begins with the calf, which ought to be well grown. Before freshening is an important period often neglected. It does not pay to skimp a cow while she is dry and carrying a calf. Neglect then must be paid for later. Cheap milk is not made by allowing cows to endure discomfort unnecessarily, such as exposure to cold storms, cramping stanchions; or rough treatment by dogs or men. The cheapest aids to feeding are plenty of pure water, sunlight, fresh air, and comfortable beds. These both raise production and lengthen the period of usefulness in the herd."

Of the 421 cows which produced more than 365 pounds of fat in the association year, 86 were pure-bred Holsteins, 170 grade Holsteins, 22 pure-bred Guernseys, 82 grade Guernseys, 6 pure-bred Jerseys, 24 grade Jerseys, 2 pure-bred Ayrshires, 2 grade Shorthorns, and 27 natives. The average production of the 421 was 9,464 pounds of milk containing 407.8 pounds of fat.



This Wisconsin Register of Production is issued and supervised by the State Dairymen's Association and the College of Argiculture, who have joint charge of cow testing association work in Wisconsin.

This shows the Empire Milking Machine with the teat cups placed on the cow, all ready to start milking.

This shows the drawing of the cow's milk from the teat through the tube into the pail. The regular, soothing Empire action promotes real cow contentment and stimulates an increased milk flow.

After drawing the milk the teat is squeezed by the rubber inflation inside the teat cup. This squeezing is effected by atmospheric pressure pressing the rubber lining of the teat cup against the teat. Notice the exclusive Empire complete "tip to udder" teat massage.

Why does the action of the Empire teat cup "go the calf one better?"

THE young calf sucks—creates a vacuum which pulls the milk from the teat. **So does the Empire Milker.**

Then the calf swallows and—**here's the important thing**—its tongue massages the teat from tip to udder. That pressure of the calf's tongue relieves the teat by sending back into the udder the blood drawn down into the teat during the sucking process. **The Empire teat cup inflation does exactly the same thing** by the gentle application of atmospheric pressure—NOT compressed air—between the teat cup shell and the soft, pliable rubber inflation.

BUT—the poor little calf may be very hungry; he may suck too hard. **That's one instance where the Empire "goes the calf one better."** BECAUSE, the action of the Empire is always uniform and gentle—since the vacuum is controlled by a relief valve. And you can't put a relief valve on a hungry calf. He wants **milk,** and he's not particular how he gets it.

Now let's talk on hand milking. Even a casual study of the diagrams on the left will prove that it is impossible for hand milking to be as uniform as that of the Empire, no matter how experienced the hand milkers may be. It would be about as impossible as making pins by hand and expecting them to be as uniform as those turned out by the pin-making machine. And note this: The Empire is not only uniform, but it is so simple to operate that **it makes everybody an expert milker.**

Now take a glance at the pulsator on the top of the Empire pail. Note its extreme simplicity. It is the only pulsator covered by a 4-year guarantee—not only in regard to materials and workmanship, **but wear also.** That's insurance of the strongest kind. It means that with the Empire you buy not simply a machine but a **guaranteed period of milker service.** We not only stand squarely back of the machine, but of the principle on which this new pulsator works. We couldn't afford to make this guarantee unless we knew that the Empire Pulsator is as perfect in action and as durable as mechanical skill can make it.

There's a hundred and one things you should know about the Empire, BUT THERE'S ONLY ONE WAY YOU CAN GET OUR COMPLETE STORY—and that is by sending for our catalog 1-M. Why not drop us a letter in the next mail?

April 25t

The Blood of the Greatest S

YOU ARE INVITED TO COME TO WAUKESHA BEFORE THE SALE TO MEET OUR MEN AND TO VISIT WAUKESHA HERDS

SALE COMMENC AT 10 A. M EACH DAY WAUKESH SALE PAVILION IF YOU WA BARGAIN, DON'T MI THE FIRS DAY

There

A 2-month-old son of CREATOR out of a 30-lb. daughter of Wisconsin's greatest sire, KING PONTIAC CHAMPION. She is now on yearly test and barring accident will make between 900 and 1,100 lbs. butter.

A yearling son of S. P. O. M. 43RD out of a 28-lb. granddaughter of CANARY PAUL FOBES HOMESTEAD. His two nearest dams average 32 lbs. butter. "43RD'S" dam is AAGGIE WAYNE PEEP with 1,250 lbs. butter at six years. AAGGIE WAYNE PEEP is the world's record cow for five years production.

Three of the best 30-lb. cows ever consigned to a public sale.

A choice five-year-old cow heavy in calf to one of the good sons of KING SUPERBA.

A daughter of SIR ORMSBY HENGERVELD DE KOL 3D heavy in calf to KING INA ORMSBY, a 34-lb. son of KING BESS JOHANNA ORMSBY.

A 19-lb. two-year-old daughter of KING PETER LYONS and out of a 30-lb. cow.

A yearling son of the 30-lb. bull, SIR JOHANNA DECIA ORMSBY, out of the 24-lb. cow, JOHANNA NEVERAGAIN—A Show Bull.

A 2-year-old daughter of COLONEL PONTIAC KORNDYKE and bred to the great KING BESS JOHANNA ORMSBY, the sire of the *Junior Champion Heifer* at the National Dairy Show.

A 5-year-old daughter of BAIRDLAND SEGIS SIR PRIZE whose daughters are known for type and production. She has a record of 712 lbs. butter, 17,669 lbs. milk in 305 days at the age of 3½ years. She is heavy in calf to KING BESS JOHANNA ORMSBY.

A 5-year-old daughter of DOETJE NELLIE, Second Prize Aged Cow at the 1920 Wisconsin State Fair, also a member of the winning Get-of-Sire, Dairy Herd, and Produce-of-Cow. This young cow is in calf to KING BESS JOHANNA ORMSBY.

A son of KING BESS JOHANNA ORMSBY, out of BROOKVALE ORMSBY KORNDYKE with 25 lbs. butter as a two-year-old and 789 lbs. butter 365 days at 4 years.

ONE OF THE WONDERFUL OPPORTUNITIES OF THE SALE—5 daughters of JOHANNA KORNDYKE KING. His daughters are noted for their large production records. Three of these have just made records of 24 lbs. as four-year-olds. Their dams are tested cows with records up to 30 lbs. The dam of one of these heifers produced 715 lbs. milk in 7 days. They are bred to a 30-lb. son of S. P. O. M. 43RD. Some one who wishes to get started in Holsteins, should consider the whole family.

Waukesha County Holstein Breeders' A

Auctioneers: Mack, Love, Benjamin

eeders' Spring Foundation Sale

and 26th

130 Pure-breds

s of the Breed is in This Sale

IN THIS SALE YOU HAVE AN OPPORTUNITY TO BUY FOUNDATION STOCK MANY OF WHICH BREEDERS HESITATE TO PUT A PRICE ON

EACH ANIMAL COMES FROM A STATE OR FEDERAL TEST AND SOLD SUBJECT TO RETEST

ill Be—

2 A. R. O. daughters of DAISY JOHANNA, both bred to 30-lb. grandsons of S. P. O. M.

A 13-month-old son of SIR JOHANNA DECIA ORMSBY out of a 24.50-lb. dam. One of the best bred and typiest bulls that ever walked.

A 5-year-old, 25-lb. daughter of SIR JOHANNA RUTH—a real cow. Her dam has a 26-lb. record.

A 4-year-old daughter of "IT" and out of a 33-lb. dam. Just bred to a 30-lb. grandson of S. P. O. M.

A 22-lb. 5-year-old daughter of MAPLECREST KING DE KOL 2D.

A granddaughter of HOMESTEAD JUNIOR DE KOL.

Two choice cows, granddaughters of PAUL ORMSBY. The dam of one of these is a daughter of KING ORMSBY—the other a daughter of JESSIE FOBES HOMESTEAD.

There is a Difference:

Every animal has been selected and passed upon for fitness.

Each animal comes from a state or federal tested herd and sold subject to a 60-day retest. This is the strongest and most reliable health guarantee that we can give.

Culls and inferior animals are barred from entry.

By-bidding by consignors or others in their interest is forbidden—and is subject to being debarred from all subsequent sales.

All animals of breeding age are guaranteed breeders.

There's a Difference:

between the Waukesha Sale and what is known as the ordinary live stock sale. There are a great many animals in this sale that breeders hesitate to put a price on privately and can ill afford to sell. We thought that that would be the kind you would want for foundation stock. TO BE CONVINCED OF THIS FACT, we invite you to COME TO WAUKESHA, "COW COUNTY, U. S. A." before the sale to meet our men and to visit their herds. Seeing is believing. Last year we had several men come to Waukesha after the sale thinking that they could buy better and cheaper privately. They found that they could have saved money by attending the sale. YOU CAN DO THE SAME.

There are more high record females and females with high record ancestry than in any other previous sale.

There will be 30 of the best bulls in the county in this sale of serviceable age and younger. Five of these will be 30-lb. bulls, some with yearly record dams up to 1,000 lbs. butter or over 20,000 lbs. milk as two-year-olds.

If You Want Foundation Stock of All Ages, Attend This Sale

ormation write

ociation, **Waukesha, Wisconsin**

For Your New Home

Ruberoid Weatherproofing Products play an important part in the construction of residences. This is made inevitable by the fundamental purposes which they serve, coupled with the great confidence reposed in them by builders and house owners.

As you look over the plans for your new home remember that from cellar to ridgepole, there are many places in which weatherproofing products bearing the name Ruberoid should be used.

Ruberoid Weatherpoofing Products have been manufactured for nearly forty years to meet a standard of quality complying with a policy which demands that the name Ruberoid appear only on products of the highest type. Ruberoid quality has accordingly become the standard by which weatherproofing products may be judged.

Because of the unswerving manner in which this ideal has been maintained, Ruberoid Weatherproofing Products are distributed by men who consider their customers' interests as well as their own.

There is a Ruberoid Distributor near you. Buy from him.

This sketch illustrates the way in which a few of the Ruberoid Weatherproofing Products are used.

1. *Ruberoid Unit Shingles insure an artistic and durable roof.*
2. *Ruberoid Roll Roofing, the pioneer of prepared roofings, is built to stand up under the severest conditions.*
3. *Ruberoid Insulating and Building Papers insure complete and permanent protection from heat, cold and dampness.*
4. *Ruberoid Cement-Waterproofing, as an integral part of stucco, permanently prevents hair cracking and leakage.*
5. *Ruberoid Plastic around roof and chimney joints renders them permanently watertight.*

For You

Jersey Breeders Organize

HOARD'S DAIRYMAN:—The Jersey breeders of Susquehanna County, Pennsylvania, recently met at the Farm Bureau Office and formed a county association. The following officers were elected: President, Claude Carter; vice-president, George Dayton; secretary and treasurer, Seldon Birchard; directors—E. V. Birchard, W. L. Bailey, Clayton Ball, and Frank Smith.

A constitution and by-lays were adopted and membership dues were placed at $2.00 per year. This county is now the leader of all other counties in bull associations and is proud to add another association to the ever increasing dairy industry here.

Pennsylvania. E. M. L. BLANCHER.

Farm Bureau Notes

The Legislative Department of the American Farm Bureau Federation is moving its office to the Munsey Building, at the corner of E. Street and Pennsylvania Avenue, Washington, D. C. Concerning impending developments, at the capital, of interest to farmers, the Washington office has this to say:

"The possibility of an embargo being placed against the importation of certain agricultural products passed with the announcement that the administration had decided, at the request of President Harding, immediately to reenact the emergency tariff legislation vetoed by President Wilson. The statement by President Harding indicates that the schedules of the tariff legislation may be changed somewhat and that it may be limited to only a few agricultural products and be in the nature of an embargo. Undoubtedly a great deal of pressure will be brought to bear to include certain items and strike out others; it is impossible to forecast at this time, with any degree of accuracy, what the result will be. It seems certain, however, that some emergency tariff action for agriculture will be attempted as soon as Congress convenes on April 11.

"On March 23, Secretary of Agriculture Henry C. Wallace met with representatives of farm organizations and the farm press at their weekly luncheon. He expressed a sincere desire to co-operate with the representatives of the farmers' organizations and most emphatically stated that the door would be open for conferences at any time on questions of interest to agricultural representatives."

Attorneys Writing Grain Marketing Contracts

The board of attorneys appointed by the Farmers' Grain Marketing Committee of Seventeen went into session in Chicago on March 28. The board is comprised as follows: Clifford Thorne, Chicago, General Counsel for the American Farm Bureau Federation and the Farmers' National Grain Dealers' Association; Fred W. Lehmann, St. Louis, former Solicitor General of the United States; J. H. Broady, Lincoln, Neb., attorney for various co-operative organizations and a member of the law faculty of the University of Nebraska; Aaron Sapiro, San Francisco, attorney for the California Prune Growers' Association, and George E. Farrand, Los Angeles, general counsel for the California Fruit Growers' Association. The board of attorneys will probably be in session all week drawing up the grain marketing contracts and reviewing the proposed constitution and by-laws in the grain-marketing plan.

The Farm Bureau Emblem

An official emblem to be worn by members of the American Farm Bureau Federation has been adopted. The general design to be used by all the states will be the same. The emblem conveys in a striking manner the idea of the intense Americanism and national strength of the Federation. It consists of an outline map of the United States, surmounted by the American eagle volant. On the map of the United States is superimposed a shield of the American Farm Bureau Federation displaying the letters A. F. B. F. The panel carrying the name of the state in embossed letters surmounts this.

The emblems are very attractive and may be obtained by Farm Bureau members upon application to the secretaries of their state federations.

Minnesota 58,000 Strong

A report from the Minnesota Farm Bureau Federation states that more than 58,000 farmers have joined the organization. Community units have been established in 459 townships in 31 counties. In 24 counties, every township has an organization.

Pabst Stock Farm Sale

The Pabst Stock Farm's second semi-annual sale held at the farm, Oconomowoc, Wis., on April 2nd, was an excellent one at which to buy a herd sire. Quite a number of the good bulls went at bargain prices, while in some cases, those that apparently possessed less actual value brought considerably higher figures.

Thirty-eight animals sold to buyers from 6 different states for a $370 average, with the 11 females included in the sale averaging ten dollars more.

John Zenter of Wisconsin bought the highest priced animal for $1,500. It was Pabst Creator Achilles, a son of Creator from a 29-lb. daughter of King Pontiac Champion, that is going at an 1,100-lb. gait on yearly test.

Pabst Creator Kinnickinnic, another young son of Creator, sold to O. B. Chiltress of Indiana for $1,250. This one was from another daughter of "Champion" that has a 35-lb. 7-day record and 920.56 lbs. butter from 19,742.7 lbs. milk in 10 months.

Haeger and Mack did the selling with S. T. Wood in the box.

Following is a list of those animals selling for $300 or more and buyers of same:

Lewis Bros., Wisconsin	
Pabst Pontiac Creator	$700
John Zentner, Wisconsin	
Pabst Creator Achilles	$1,500
C. E. Cole, Wisconsin	
Pabst Creator Model	$440
A. J. King, Missouri	
Pabst Creator Daisy	$500
A. L. Russell, Wisconsin	
Pabst Creator Elder	$700
G. Tobiason, Iowa	
Pabst King Pontiac Lad 43d	$375
G. S. Bohland, Illinois	
Pabst Creator Cynthia	$700
G. R. White, Illinois	
Pabst Champion Creator	$500
H. W. Bennett, Wisconsin	
Pabst Creator Homestead	$300
W. H. Grueble and Wm. Menschke, Wisconsin	
Pabst Creator Ivy	$650
O. B. Chiltress, Indiana	
Pabst Creator Kinnickinnic	$1,250
Gay and Williams, Wisconsin	
Pabst Hillvale Inez Ormsby	$520
Pabst Abbie Van Roberts	300
Gramling Bros., Wisconsin	
Pabst Pontiac Ormsby	$320
Harry Ellsworth, Wisconsin	
Pabst Deerberry	$550
Samuel Hall, Wisconsin	
Pabst Mullvale Ormsby 2d	$310
C. H. Peterson, Wisconsin	
Pabst Pontiac Star 2d	$4.50
Marlow and Randall, Minnesota	
Pabst Gladiole 3d	$430
Pabst Iris 2d	505

It works both ways: A pure-bred sire pays for himself in improved offspring; a scrub soon loses more money for its owner than a pure-bred would cost.

The time when thrift counts most is when prices are coming down and the dollar is really beginning to be worth a dollar.

Experience With Annual Sweet Clover

HOARD'S DAIRYMAN:—Were I to express my well founded conviction as to the merits of the new annual white sweet clover, my sanity would undoubtedly be questioned. There are few grocers who have a quantity of seed, and this is limited. My experience deals with a thousand plants from a small package of seed from the Federal Department of Agriculture, and about three pounds of the Iowa Seed which was planted for one of the well known seed companies. The latter planting was a failure in a commercial way, yet it is worth the cost because of information acquired. The seed from the Department of Agriculture was planted on much poorer ground which was better drained. Heavy rains followed the planting, and evidently on the better though more poorly drained soil, the seed was washed to such depth that it failed to appear for five or six weeks.

I could detect no difference in habits or root system of the two strains of seed. One would infer that in the remote past sweet clover was an annual, and that the present selections are from plants which have reverted to this distant habit.

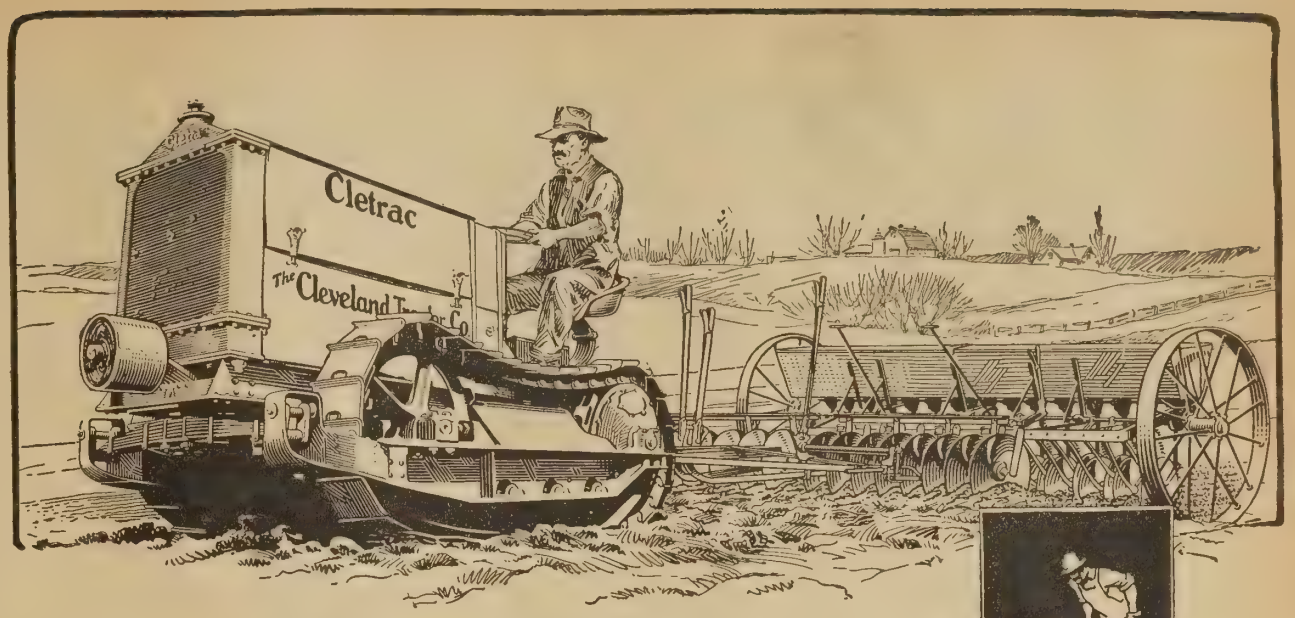
Sixty days from date of planting, June 1st, northeastern Ohio, one plant was in blossom and others blossomed within a week. At this time the five rows were of sufficient height to have afforded a fine cutting of hay. In view of its quick growth, when seed price warrants, the farmer who recognizes failure of hay crop in early summer can insure sufficient feed by planting annual sweet clover. Planted with oats as has been tried in an experimental way, will afford an excellent hay crop, and pasture or a seed crop later in the season. In all probability, the anuual sweet clover possesses the hardiness of the biennial, and such being the case it may reseed itself in northern latitudes. A Michigan farmer contends that a part of his farm is covered with annual sweet clover which has reseeded itself, the seed surviving winter hardship.

I find that in the north for seed purposes, annual sweet clover should not be planted much later than early April. I allowed the plants to stand this year until the first week in November, and they showed such tendency to continue blossoming and bearing seed in spite of several frosts, that in my opinion six weeks added to the growing season would have been necessary to insure maximum results.

The soil requirements are the same for annual and biennial sweet clover. The annual strain has similar root system, and its rapid growth may necessitate greater available fertility. The five rows were limed excessively at rate of 10 tons to the acre while the acre field received two tons. Soil from an alfalfa field was drilled in excess of 300 pounds to the acre and acid phosphate was drilled at a separate operation at rate of 500 pounds. The nodules exceeded the root system in quantity, and their growth indieates that this legume is probably one of our greatest nitrogen gatherers. During the month of August the plants grew fully an inch daily. At one end of the five-row plat the soil was a clay loam, while at the other end very heavy clay, yet at this end of the rows was by far the greater growth. The growth exceeded that of a few plants, carefully tended on gravelly ground, a few miles away.

The annual habit is undoubtedly firmly fixed. Of a thousand plants, I observed three which made growth which compares to the first year in the life of the biennial. The root system is such that it adapts itself to circumstances. About one plant in 25 shows a tap root tendency. Two particularly interesting, heavily seeded plants with this type of root were saved for seed, as plants of such nature would be invaluable in breaking up the heavy clay hardpan underneath our surface soils. Many of the plants grew to height of six and seven feet. These exhibited tendency to continue flowering, with little disposition to mature seed. About twenty plants, which grew waist high, represented the number of medium height plants maturing maximum amount of seed. Other plants were not as efficient seed producers as the biennial plants some distance away.

With the production of as high as 15 tons of green manure per acre, the annual sweet clover will prove to be our greatest soil builder. Its quick growth will make it particularly valuable to fruit growers. It will prove helpful as pasture for dairymen. On clay soils subject to heaving, the success of alfalfa is doubtful, and biennial sweet clover is but a limited success. Here the annual strain will insure a good hay crop the season of planting.



It is probable the dairyman, by the use of annual sweet clover and vetches, can lengthen his pasture season in the north one or two months, and provide valuable midsummer pasture which is a serious problem.

Beyond question in the writer's mind, for northern state it is a most valuable discovery as hay and forage crop. It cannot be excelled as a green manure in any section where land can be used for its growth during the warm seasons. The seed will necessarily be high in price for a decade or more, but demand will probably exceed seed production. Above all this plant will reclaim millions of acres of unprofitable soils. A few acres of this legume on each farm in a county will gather and store more nitrogen in the soil than could be transformed from the air by our national nitrate plants.

Ohio. WALTER JACK.

It is agriculture alone that fixes men in stationary dwellings in villages, towns and cities and enables the work of civilization in all its branches to go on.—E. EVERETT.

Cletrac Speed Gets in More Seed

Works Fast Over Soft Plowed Ground

THOSE first few days when ground and weather conditions come just right for planting—that's when speed counts. Cletrac has it to burn.

Cletrac is no quitter. In seeding—or any other operation—Cletrac sticks to the finish hour after hour and day after day. It holds its steady gait and gets the work cleaned up in short order.

The two wide tank-type treads get a firm grip on the soft seedbed. No power is lost through slipping and Cletrac travels swiftly along—always delivering the full-rated drawbar pull of its big motor.

Even when hauling a double disc harrow and a heavy drill, Cletrac doesn't dig in or pack the soil.

Cletrac's short-turn ability makes it mighty handy. Its heavy-duty motor is unusually flexible—develops ample power at all speeds. Its easy handling and wide utility recommend it to farmers everywhere.

"Selecting Your Tractor" tells why Cletrac cuts crop production costs on every size farm. See the Cletrac dealer near you.

Write us for a copy of the booklet.

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Filling the Corn Popper

"I don't believe a good business farmer would spend money for popcorn, Bruce," said Mrs. Carter to her son, as he climbed back into the comfortable family car with a large sack of freshly popped corn he had purchased from the popcorn man on the corner.

"Good business, mother, when you are hungry for popcorn, isn't it?" he queried as he proceeded to fill his mouth. Then, turning to his father, he added, "You had better drive home, dad, I'll be busy the rest of the way."

"But it is not good business," his mother insisted. "What did that sack cost you?" she inquired.

"Twenty cents," he answered between the munches, "and cheap at that. Why, what difference does it make, ma?" he grinned sidewise at her. "Seems to me that you are getting mighty close since you allowed me to go in with Bill and Jimmy in the chicken business."

"It isn't that I care about the twenty cents, Bruce, but what I mean is, that it seems like an unnecessary expense that could be avoided. How much corn do you suppose it took to make that sack full?" she inquired, determined to drive home her point.

"Oh, I guess a small handful," he answered carelessly as he continued to lower the sack.

"That's just it, my boy," she quickly interposed. "A small handful! And do you suppose it would cost twenty cents to raise it?"

"Why, of course not, mother, but the fellow who raises it and that fellow who sells it already popped, have both got to make a profit or they couldn't do business. People must be willing to buy it or these fellows wouldn't be in the business."

"Certainly these city people will buy it. That's the only way they can have popcorn, but it does seem rather foolish for farming people to spend money for something that they could just as well produce themselves, doesn't it? And besides you can never have popcorn just when you want it unless you raise it yourself."

"Well, if that's what you are driving at, ma, for heaven's sake why don't you say so. But I always thought that it would be out of the question for me to raise popcorn. I'd be tickled to death to try it if you and dad would just say so. There are so many things that you would never let me do—well," he sighed, "I just thought that I would always have to buy my popcorn."

"But matters have changed since you have entered the chicken business, dear, and I guess you might as well raise some popcorn for the family as well as to raise chickens. Would you like to do it?"

"Of course I would, and I think I know something already about doing it," he brightened up at the thought. "We studied all about popcorn this winter in our agricultural class and it surely will be lots of fun putting some of those ideas into practice."

His father, who had been silent up to this time now spoke up. "All right, son, you and I will form a partnership for growing popcorn and we'll begin operations this spring about time to plant corn. Now of course," he continued, "we mean popcorn growing for the family, Bruce, and not to raise it to sell. I believe it is a good idea that mother has expressed. I know we always used to grow popcorn when I was a boy and we found as much fun in popping it as we got pleasure from eating it. The winter evenings did not seem half so long and dry when we had plenty of popcorn and apples to munch on," he explained as the car sped toward home. Then turning to his wife, he added, "Those were the good old days, mother, the days of horses, rail fences, rugged boys and girls who were happy and contented with the life that the old farm afforded with its homely pleasures. And when I think back to the times when I was a boy, I am always reminded of the quantities of popcorn and apples, yes, real, rosy cheeked apples that we raised ourselves. Night after night during the long, cold winters, we had apples, popcorn, and stories without ever tiring of any of them. I sometimes wonder what has become of the good old times known to every farm boy and girl of my day. I'm afraid they have passed with the progress of time," he seemed to sigh, "but, Bruce, you and I will bring them back to our home this next winter and there is one thing that we will promise mother and that is plenty of popcorn."

And the idea seemed to grow the more he thought about it, for suddenly he burst forth again, saying, "By gum, Bruce, I've got a better idea still. We'll form a popcorn club for all the boys and girls so that every one can get in on the fun. We'll see that we get seed enough for all and then we'll hold a few meetings to instruct all how to grow popcorn. What do you think of the idea?"

"Great, dad, if you mean it! They'll all come in on it and we'll have plenty to talk about at our meetings and we might even offer a prize to the best grower at the end of the season."

"Why indeed I mean it, son, every word of it and that's just what we will do, offer a prize to the best grower when the season is over. But what do we mean by the best grower?" he queried.

"I would say that the fairest thing to decide that on, is to have all grow an equal area and the one who raises the most ought to get the prize. That will be fair to every one and of course you and I want to come in on the prize stunt too. I wonder what would make a good prize," he pondered.

"Well, I know what I'd want," suggested his mother.

"What, ma?" he questioned.

"You never would guess, son, if I gave you all night to do so," she laughed.

"Suppose some of the things that all women like and that men don't give a rap for," he answered to her challenge to begin the guessing.

By this time they had reached home and the car had stopped directly beneath the leafless boughs of the old cottonwood that for fifty years had burst into green each spring. The evening was superb, a combination of April moonlight and southern zephyrs. But to Bruce this delight of Nature passed unheeded as he began to guess everything from a string of pearl beads to a Baby Grand piano. But to every guess there was the same answer. "Well, I'll give up, dad! Haven't you got a guess? You ought to understand women better than I do!"

"Yes, I've just one guess," he answered, "And it is the very thing which I would have suggested myself. I think I have it," and he slyly winked at his wife. "It's a corn popper," he exploded, "the most up-to-date one that can be had. How about it, mother?"

"How did you ever guess it?" she laughed enthusiastically.

"Because that seemed the most sensible thing, of course. Popcorn wouldn't be much good without a popper. That's what made me think about it."

"Bully for you, mother," Bruce agreed. "That will make a real prize and I'll bet there will be a scramble for it. Why couldn't I think of that," he added in disgust, as he opened the door of the car for his mother.

"Looks as though I had started something," Mrs. Carter commented as the three sat about the blazing hearth which Bruce had but a few minutes previously lighted to take away the lingering chill of winter from an early spring evening.

"You bet you have, mother," Bruce quickly answered, eager to continue the plans started by his father. "I was just thinking about the best variety to grow," he added.

"Why I didn't know there were different varieties of popcorn," his mother responded with genuine interest. "I thought that popcorn was just popcorn."

"No, indeed, mother," he quickly answered, eager to enlighten her. "That is not the case at all. You should see all the kinds of popcorn we had in our agricultural class this winter. There are reds, whites, yellows, and blues and they differ a great deal in size too. There's one very interesting variety that is called Tom Thumb; it is so tiny," and he judged its size by holding up his little finger. But maybe I had better start a little farther back so that you will understand," after seeing the interest he was attracting.

"First of all, there are two general classes of popcorn, the smooth kerneled kind known as pearl popcorns and the sharp kerneled ones known as the rice popcorns. Now it is claimed that the rice kinds are the best poppers because their seeds are harder and the harder the seeds are the better they pop. And we proved that, too, this winter at school by cutting open kernels of both kinds. Maybe you don't know, dad, that a great deal of the popcorn that is sold in the cities is raised in two counties, one in Iowa and the other in Nebraska. There you will find people who make a regular business of growing popcorn and they grow more of the rice kinds than any other. The public seems to demand them. There are two varieties that are especially good. Both are white. One is the big white rice and the other is the baby white rice. The baby rice is especially good, because it pops a big fluffy kernel and its hull it quite tender. It is a good yielder too. The ears are funny looking little things—about as big around as they are long and the kernels are very small. The kind I bought tonight was baby rice and I'll bet that we can get seed from the same place that he buys it from."

"How interesting this all is," remarked his mother as she turned to her husband. "And did you learn all this in your agricultural class this winter, Bruce?"

"Sure did, mother, and lots of other things besides," he proudly answered. "We study all kinds of things in that class," he boasted, "and believe me, we all like it lots better than some of the other things we study. Say, dad, don't you think we had better be making plans for the organization of the club?"

[To be continued]

Moreland Township, Penn., Holstein Calf Club

February fifth was the birthday of the first Holstein Girls' and Boys' Club in Lycoming County, Pa. The Central Pennsylvania Holstein-Friesian Breeders' Association, Williamsport, Pa., at their December meeting, took definite action to support such a club and placed responsibility for finding the girls and boys upon the county agent. The following week the county agent opened the subject at a community meeting in Moreland Township where a hearty response was met.

The heifer calves were furnished by members of the Breeders' Association at a uniform price and notes maturing in six months with renewal privilege were given in exchange by the club members.

Distribution was made on the farm of Clarence Reece and each club member drew a number to correspond to a number on a calf. The calves will be shown at the Hughesville Fair next fall and club members will be privileged to enter their animals in the annual sale of the Central Pennsylvania Holstein-Friesian Association to be held at the Hughesville Fair next fall.

Flock Bros. have offered a bull calf to the member of the club who takes first prize at the round-up. The association has offered a second prize of $20 in cash, and a third prize of $15 in cash.

The father of every club member

MORELAND TOWNSHIP, PENNSYLVANIA, HOLSTEIN CALF CLUB.
THE MEMBERS HAVE THE CALVES THEY DREW

has made application to have his herd tested for tuberculosis on the accredited herd plan.

Up until the formation of this club pure-bred Holsteins were not numerous in Moreland Township, and it is hoped that this movement will be the forerunner of a healthy development of the industry.

Reports have come to the farm bureau office that more heifer calves are wanted in Moreland Township. The association plans to follow up the club closely and to give every assistance to the girls and boys with calves. At a recent meeting they decided to entertain the club members at a picnic with the idea in mind of becoming better acquainted, and possibly helping the members with their calf raising problems.

Lambs for Pets

HOARD'S DAIRYMAN JUNIORS:—I suppose you think I have entirely forgotten the club, but I haven't at all. I have been busy helping with the work and didn't get time to write.

I sold my lambs to papa and he shipped two and sold the other one to a neighbor.

I have been sick with bronchitis lately, I haven't been to school for just three weeks today.

My chickens which I sold to mamma in November are as big as a year-

AGNES M. SPAULDING AND HER PET LAMBS

old hen; I can hardly tell them from the rest of the flock.

I intend to raise lambs and chickens next year. I think they are very little bother and need very little care except when they are both small, they need quite a bit of care.

I enclose a picture of myself and my lambs. You can hardly see the one as she was standing back of the other white one drinking from another bottle. The one walking toward the camera is Nigger, the white one is Fuzzy, and the one standing back of the white one is Snow. I will close wishing the juniors good luck. If some of the juniors wish to write to me my address is R. F. D. No. 1, Box No. 164, Buchanan, Mich. AGNES M. SPAULDING.

Junior Letters

Hoard's Dairyman Juniors:—How is everybody getting along? I hope fine like myself. They organized a farm club here some time ago and my father was elected secretary and treasurer. He has the main work to do so it keeps him busy sometimes.

Now I will tell you something about our animals. We have four horses, five cows, four calves, two sows, fourteen pigs, and about 125 chickens.

We sold our old bull, but have a young one; he is also a pure-bred.

I guess I'll close for this time. I wish I would get some junior letters. I will be glad to answer them. Wishing the juniors good luck. My address is Zell, Mo.

Richard R. Huck.

Hoard's Dairyman Juniors:—I am 16 years old in May and am living on a 160-acre farm. We do not sell milk as the roads are too bad and we are too far from the market.

Last year we raised 9 pigs from one litter. One pig was killed by its mother the first day. We fed the other nine pigs on skimmilk, cooked potatoes, and bran with some grass as they were about one to two months old. We butchered all but one pig at nine months old. The pigs weighed on the average 150 lbs. We did not sell any of them as we are not going to raise any pigs this year because we haven't enough feed to raise them, besides there isn't enough pasture to graze upon.

We have 34 chickens and get 16 to 20 eggs each day. One chicken lays every day. We feed them oats, corn, and potato mash with bran, and fresh water is within reach of the hens all of the time.

Minnesota. Eugene Hamack.

Hoard's Dairyman Juniors:—I am thirteen years old and in the eighth grade in school. We have taken Hoard's Dairyman for a long time and I read everything in it.

I have a pair of Checkered Giant rabbits and they weigh about 15 lbs. apiece. We have 25 cows and 4 calves; 3 of the cows are milking. We have about 60 pure-bred White Leghorn hens. We have 4 horses and our farm has about 300 acres of good land.

We built a large barn in 1913. It is 100 feet long, 50 feet wide and 60 feet high.

I keep my rabbits in a pen and feed them bran, oats, and water in the morning and at noon green food. At night I give them a good feed of carrots and grain or water.

We raise about 200 bushels of potatoes each year.

New York. Kenneth Turnbull.

Hoard's Dairyman Juniors:—I am very proud of being a Hoard's Dairyman Junior and I hope I can be of some value to you.

I am twelve years old and in the eighth grade at school. I have a black and white calf named Bossy. It is about six months old. My father has eighteen head of cattle and six horses. I have four brothers, two older than I and two younger. My oldest brother retails milk.

If any of the juniors wish to write to me I'll answer their letters. My address is R. F. D. No. 1., Pennsburg, Pa. Harry Wood.

Hoard's Dairyman Juniors:—I am eleven years old and am in the sixth grade at school. I walk two miles to the Barnesville school. I am a member of the Belmont County Calf Club. I have a registered heifer. My brother, older than I, is also a member of the calf club. I have a fine dog and two cats. I live on a 67-acre farm on which we raise all kinds of grain and hay. We have four horses and fifteen head of cattle. I would like some of the juniors to write to me. My address is R. F. D. No. 1, Box 25A, Barnesville, Ohio.

Lewis J. Skinner.

Hoard's Dairyman Juniors:—I live on a five-acre farm twelve miles from Portland, Ore., near a small sized town named Oswego where the mails are brought in on the electric car to be delivered to us by the rural route.

We have taken the Dairyman for about two years. Daddy had heard of its good, reliable reputation, so when we went to the International Stock Exposition held at Portland, January, 1919, we subscribed. It has come regularly and we are very well pleased.

Juniors, do you enjoy the other editorials as well as your corner? I haven't heard an opinion expressed but all seem enthusiastic about their part in the farm paper.

One hears a great many people remark that they think they should die of lonesomeness on a farm, it seems to them such a dull life! But I find the very opposite to be the case, and I'm sure anyone who really truly lives on a farm will agree with me. There's so much more really wonderfully interesting, almost fascinating things in the great outdoors than a crowded, murky city, even a nice one such as I live near. Whenever I find it growing monotonous the car line is right at hand; a half hour's ride brings me into the heart of Portland. A day there usually finds me more than content to come out to the open again.

The animals on our place number ten, five Angora goats, two cats, one chicken, and a cow which gives about three gallons. We sell some and have all we can use for the house.

We have been, for the past two years, engaged extensively in the poultry business but shortage of labor and other conditions made it too much work so we discontinued it. Last year we brooded two thousand baby chicks, White Leghorns, and from them got six hundred pullets which laid fifty per cent in the dead of winter. We never had any failure in starting or making them lay. They were direct from the Tancred Farms, Kent, Wash., a noted, high laying strain. His chickens are trapnested and some of the best grade chickens run as high as seventy-five cents apiece.

We tried raising pigs on a small scale but just broke even on account of buying all the feed as we hadn't suitable pasturage to reduce costs. They were good grade Poland-Chinas.

I'm one of a family of four, two girls, father and mother. I am in the eighth grade in school. I am fourteen years old. There's just eighteen months' difference in age between myself and sister. Sometimes we are taken for twins.

Well, I must close as it is nearing my bed time. I would like to hear from any of the juniors who care to write to me. Am fond of writing and receiving letters. I'll send a picture when I have one taken. My address is Route 1, Box 6, Oswego, Oregon.

Merle Lawson.

Dairymen, Protect Your Profits!

THE hard-to-get-at places in your separators, milk cans, etc., lodge bacteria by the million—and bacteria impairs the quality of your product and cuts into your profits. Clean out these bacteria nests with Grade No. 3 American Steel Wool. These fine, flexible steel fibres penetrate every nook and corner, crevice and cranny where dirt accumulates. Wash cloths can't get into these hidden places. Throw them away! American Steel Wool cleans, scours and polishes in one operation.

American Steel Wool is used by Nestle's, Mohawk Condensed Milk Co., Borden's and Sheffield-Slawson-Decker Farms.

Put up in one-pound packages and in Household sizes. If your dealer cannot supply you send us his name and 15c, and you will be supplied with a Household package.

Anton's Starlight of Prospect 67294

SIRE—ANTON'S KING CONFIDENCE NO. 43517
DAM—ARVILLA OF PROSPECT 71589

This young bull is one of the big boned type. He is well filled out and his quality is excellent. He is the right kind of a sire to build up a herd and to instill some of the best blood of the breed into their veins.

His sire is Anton's King Confidence 43517, our present senior herd sire, who traces six times to May Rose 2nd.

The dam of Starlight is Arvilla of Prospect A. R. She is one of our grand old cows and has a record of 335.91 lbs. of butterfat in a year as a two-year-old on twice a day milking and regular herd rations.

This bull is an excellent buy for the man in search of an A-1 at a reasonable price.

The Farmer As An Employer

An Allegory of the Workers in the Soil

E. J. LEENHOUTS, MICHIGAN

Did it ever occur to you that each farmer has in his employ more laborers than any person of any other profession in the world? If so, do you realize that he has also the best and cheapest employees in the world? These statements are, nevertheless, true, as leading bacteriologists and agronomists have proven to the satisfaction of all students of soils and agriculture. They have concluded that every ounce of soil of average tilth and fertility is the home and workshop of millions of soil bacteria, each one of which is working for the farmer's interest.

To estimate the number of these micro-organisms that a farmer on an eighty-acre farm would be employing is almost an impossibility, and it assuredly would give us a figure whose magnitude is absolutely beyond the realm of our imagination. Without going through any mathematical processes, we can readily see that the figure would mount up into the billions. Is there any man in any other industry, trade, or profession that they are so faithful? According to army vernacular, they are the "K. P.s" of the plant kingdom. In the army this is considered the most disagreeable task to be imposed upon offenders of camp regulations. Expressed in terms of polite English, these organisms are the chefs of the farmer's crops. All day long they are industriously employed in the preparation of the food for the plants. The process of preparation requires not only the predigestion of most of the foods, but even the gathering of a large amount of it. Some of it has to go through quite a lengthy process before it is satisfactory to the plant's palate. The myriads of tiny laborers are divided into five large armies, each one being assigned to a certain kind of food, and they are specialists in the gathering and preparation of the same. Besides these five main armies, there are, of course, many smaller armies or divisions.

The first army is assigned to the task of digging up the mineral foods

The Albany Community House, Albany, Oregon, Headquarters for the Albany Chamber of Commerce, the Linn County Farm Bureau, the Linn County Chapter American Red Cross, the American Legion, Boy Scouts, etc. In the building are a gymnasium and shower baths which are used by the students of Albany College, Albany High School, and grade pupils as well as athletic classes and teams of business men, lodges, and clubs. Dances, parties, luncheons, receptions, and all sorts of gatherings are being held at the Community house almost constantly.

Here the town men and their fellow business men from the farms are learning to know each other better because of closer association through the two organizations quartered here: The Albany Chamber of Commerce and the Linn County Farm Bureau. Both these organizations are more and more realizing that there is not, after all, such a chasm between town and country organizations as the "jingoes" would have us believe and they are finding that many of their problems have much common ground and must be worked out jointly.—S. V. SMITH, Oregon.

can claim as many individuals in his employ?

But, are these "little fellows" really such excellent laborers? We usually judge our employees by the quality and quantity of the work which they produce in return for the wages which we pay them. Let us do likewise with our little friends, the soil bacteria.

From morning to evening and all through the dark hours of the night, these micro-organisms labor unceasingly. Nor do they limit their activity to the warm summer months, for they start early in the spring and keep on toiling till frost freezes up their homes in the fall, unless their employer has seen fit to starve them to death before this time. They are never caught "loafing on the job", nor do they ever organize strikes. Faithful to the tasks assigned them, they are ever toiling on, giving their very best at all times. Can you find any man in any other profession that can say the same about all of his employees? If there were such a man, he would indeed be the object of great envy by his fellow employers.

What *is* the task assigned to these prodigies of labor—the task to which for the plant and bringing them into solution in order that the plant may be able to drink them. One division looks after the sulphur, another after the potash, another after the iron, another after the phosphorus, etc., each one a specialist in its line. They dig down into the soil particles, bring out the pure mineral, dissolve it in the water which surrounds each grain of soil, and thus change it to such a condition that the plants eagerly lap it up and incorporate it into their tissues. This army might be called the mining unit of the cooks.

Another powerful army is engaged in the transforming of the proteid substances which are found in the soil. This is such a complicated process that it calls for three distinct steps, and, consequently, the army has been divided into three divisions, each one a specialist along a certain line. Their work is so much similar to that of the chemist that we might call this army the chemical unit of the chefs. The first division, called the ammonifying bacteria, changes the proteid substances to ammonia, but the plants refuse to eat it in this form. Thereupon another division, called the nitrous

bacteria, seizes the ammonia and transforms it to a nitrite. Still, the plants do not deign to touch it, and so the third division is called in to do its part. This group, called the nitric bacteria, quickly add some oxygen to the nitrites and change them to nitrates. Behold! the plants reach for the nitrates greedily and devour them.

A third army is still more ambitious. Its members are not satisfied with using the ordinary soil material, but they reach out into the air and capture some of the nitrogen which is found in the air. They might be called the hunters who go out into the woods to capture wild game, bring it home, and prepare it for the table. After they have prepared it in such a way that the plants can use it, they store it away in the soil for future use, and then they go out and capture some more. The bacteriologist calls ambitious laborer the Azotobacter.

Besides doing all these prodigious tasks, these three armies are obliged to hurry around and provide themselves with food. The fourth army of soil micro-organisms, however, has become dissatisfied with this inefficient system of having each individual hustling around to obtain all its own food supplies, thus decreasing the amount of useful work done. It has conceived a plan of "give and take" whereby the plant is called upon to furnish them with the carbohydrates and organic acids which they need as food, while they devote all their time to the gathering of nitrogen from the air and making it available for plant food. The plant can not gather the nitrogen, while the bacteria find it difficult to gather sufficient organic acids and carbohydrates to maintain life. Following up their plan, these determined little workers have invaded the leguminous plants through the root hairs in spite of the stout resistance offered by the host, and they have attached their kitchens and storehouses to the roots of the plant. The host soon realizes the benefits which it obtains from this combination and tolerates the presence of the bacteria. While the plant is helping itself to the nitrogen which the little workers have stored away, the latter are likewise helping themselves to the carbohydrates and organic acids of the plant. Here, indeed, is a case of specialization in industry. Each one of the contracting parties is mutually benefited, and much more useful work is accomplished. This process is called the symbiotic fixation of nitrogen, and the organism is called Pseudomonas radicicola.

Besides these four vast armies of soil bacteria whose activities we have briefly described, there are thousands of different species found in the soil, each having a special duty to perform. Together, they constitute the fifth army. The upper eight inches of soil is an enormous kitchen and storehouse in which billions of little creatures are laboring day and night in order that there may be enough food prepared for the plants which the farmer is trying to raise. They are all laboring for the farmer and he is their master.

Since these little "fellows" are such faithful workmen and have charge of work of such vital importance, one might naturally suppose that they would demand a big reward for their labors. On the contrary, they ask nothing of the farmer but proper food and living conditions in order that they may continue with their work. They require a certain amount of oxygen, water, and food. The oxygen and water are found in the pore spaces between the particles of soil, where the bacteria can reach them. But frequently too much water enters these vast kitchens, fills up all the spaces, and crowds out the air. Then the poor, faithful workers die of suffocation. The farmer can do a great deal to alleviate such hardships by under-ground and surface drainage, and by tilling the upper strata of soil, thus bringing about proper aeration and removing the excess soil water. He, however, is very often so ungrateful that he refuses to do this for his diligent employees. The same is true in providing the food They want only decayed organic matter, which costs the farmer very little. Humbly they beg of him these three cheap elements in return for their labors, but the average farmer frequently disregards their pleas, and consequently assassinates the very laborers that have made it possible for him to live and prosper. To save his own life as well as that of his little friends, he should immediately attend to the drainage, tilling, and the supplying of organic matter.

One other thing that these micro-organisms, especially the nitrogen-fixing species, ask of the farmer in order that they may live and he may prosper, is a neutral soil. In order that their home and workshop may be inhabitable, it must not be built of soil that has an acid reaction. Although neglected on every hand, this is a condition that can readily be remedied through the application of limestone.

That is the sum total of the wages demanded by the most faithful and tireless workers in the world—food and proper living conditions, all of them supplied at a small expense, if the employer wishes. If he refuses to pay these wages, they do not organize a strike, but they continue working until they are exhausted, and then they die. Are they worthy of their wage? Yes, a thousand times over. Without them the farmer is absolutely helpless and must surely starve.

Therefore, let us, as farmers, look after the welfare of our myriads of employees in order that they may live, that we may prosper. Let us make conditions such that our chefs of the plant kingdom may accomplish the most work for us. Then the mining unit will march out with pick and shovel to prepare the minerals for our plants; the chemical unit, with its three divisions of specialists, will take its chemicals to attack the proteid substances, digesting and preparing them for plant consumption; the hunting unit will go out through the air spaces, capturing and bringing home the nitrogen; and the highly specialized unit of thieves will proceed with their theft which ultimately brings about beneficial results for the individuals robbed.

2 Good Bulls For Sale

King Pontiac Tehee Abbekerk, a 4-year-old grandson of King of the Pontiacs from one of the good A. R. O. daughters of Tidy Abbekerk Prince. He is sound, half white, and a good individual. Price $250.

Also a young son of the above sire from a good producing dam. Straight as a line. More than half white. $100.

S. R. McCANN, Rich Hill, Mo.

FOR SALE Guernsey Bull

ZION'S STAR OF LIBERTY 68505. Born June 23, 1920. Masher's Sequel breeding. Sired by Hildred's King of Oaklawn 29781 by Imp. Silver King of the Isle 14363 with 8 A. R. daughters, a son of Imp. Sequel's Monogram 15649 with 26 A. R. cows.

Dam—3-year-old Imp. granddaughter of Galaxy's Sequel with 47 A. R. cows and 22 A. R. sons. A beautifully marked growthy-typy calf. Don't pay until you see him. Worth twice what we ask. Priced to sell at $125.00.

MOUNT ZION RANCH, Poynette, Wisconsin.
Address M. M. Parkinson, Madison, Wis.

For a 32-lb. bulk I will take your note for either of these high class bulls. We will give you your choice of the following bulls ready for service under our regular gilt edged guarantee. These bulls have a straight top line and possess every feature of show ring quality. They are from the most popular breeding strains and our prices are lower than ever. Study the breeding carefully and see what you are getting in these bulls. Send us a check today for $100 and we will carry the balance any reasonable length of time.

KING LYONS BOON GERBEN is the sire of the bulls offered. He is a grand individual and promises to make a great bull. He is by a 35-lb. bull. RAG APPLE KORNDYKE BOON who is now recognized as one of the greatest bulls of the Middle West; he is from a 33-lb. dam, 29-lb. grandam who is followed by a 900-lb. cow. Consider what you are getting in this bull. The grandam on the sire's side is a 38-lb. cow.

Dam, JESSIE FOBES MAUD BURKE CANARY 2ND, 4½-year record (28.86). She is daughter of HAMILTON COLANTHA LAD who is a son of COLANTHA JOHANNA LAD, that great bull that has more high records in milk production than any other bull. The dam is from a 27-lb. daughter of HOMESTEAD JR. DE KOL. The price for this bull is $500.00.

OMAHA SEGIS LYONS, 4-year-old record (31.56). She weighs 1,850 lbs. One of her sisters has a 39-lb. record. Her sire is KING SEGIS LYONS who has nine 30-lb. daughters. He is a son of KING HENGERVELD. His sire's dam, CATRINA SEGIS (23.12). Her dam is a sister to NIVA KALMUCK, Nebraska State Champion (45.18), KING SEGIS breeding.

The Price of This Bull is $650.00

Otto F. Schauble, Pilger, Nebraska

Ohio Guaranty State Sale
May 4-5, Columbus, Ohio

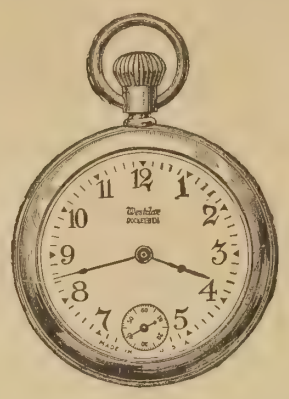
State Fair Grounds — Sale starts both days at 10 o'clock

Ohio is the Place to Buy Cattle, Because—

1. She has more 1,000-lb. cows, more 1,100-lb. cows, more 1,200-lb. cows than any other state.
2. She offers you the kind of Holsteins that will make 1,000-lb. records.
3. Her cattle are free from disease and guaranteed not only by the breeders but the county clubs and the Ohio Holstein-Friesian Association.
4. She furnishes the papers for every animal on sale day.

WE HAVE CONSIGNED sons and daughters of many of Ohio's best bulls. A few of them: PRIDE OF THE ORMSBYS, KING WALKER CLOTHILDE, FINDERNE PRIDE FAYNE, LOTHIAN MAGGIE DE KOL'S SON, KING ONA, KING ONA PONTIAC, ALEC (the bull that up-set the dope), FAIRVIEW PONTIAC BEETS KORNDYKE, MEADOW HOLM PEEP HARTOG. KING OF THE PONTIAC'S SON, PIETERTJE HENGERVELD SEGIS.

WE HAVE 30-lb. cows, sons of 30-lb. cows, daughters of 30-lb. cows, sons of 1,000—1,200-lb. cows, daughters of 1,000—1,200-lb. cows. In fact you will find in this sale heifers, cows, or bulls to suit the most particular breeder as well as the fellow who wishes to start in a small way with real quality Holsteins of show type.



Next week we'll tell you all about them. Just mark your calendar now and get ready to come to the greatest Holstein event ever held in the Buckeye State.

OHIO HOLSTEIN-FRIESIAN ASS'N

HOWARD C. BARKER, Field Secretary TIFFIN, OHIO

Westclox

—that's Big Ben's family name

Let Pocket Ben time your day

POCKET BEN tucks into the pocket of your work-shirt and is right there when you want to know if there's time to start that other job before dinner.

Yet you don't have the uncomfortable feeling of risking damage to that high-priced watch of yours when you're out on the job. Pocket Ben's sturdy, double-back case helps him stand the racket.

Pocket Ben got his education in the same school Big Ben came from; they both bear the Westclox family-name which means good time-keeping wherever you find it.

See Pocket Ben at your dealer's. He's built for service rather than for show. But you'll be surprised at the amount of good timekeeping you get out of him for a very little money.

WESTERN CLOCK CO., LA SALLE, ILLINOIS, U.S.A.

Makers of *Westclox:* Big Ben, Baby Ben, Pocket Ben, Glo-Ben, America, Sleep-Meter, Jack o'Lantern

Factory: Peru, Illinois. *In Canada:* Western Clock Co., Ltd., Peterborough, Ont.

A Full Pail Every Milking

That brings the smile to the dairyman's face—the money to his pocket. Big production, day after day, depends on the *condition* of the cow—her health and vigor—her ability to digest her feed and convert it into milk.

Pratts Cow Tonic

is the most dependable conditioner and health-builder for cows. It acts quick—it helps increase and hold up the milk flow. Try it—*at once*—on one cow or your whole herd. Note the improvement in health—the full milk pails—the husky, healthy calves.

"Your Money Back If YOU Are Not Satisfied"

Ask your dealer for the ***genuine Pratts****—and get it!*

PRATT FOOD CO. Philadelphia Chicago Toronto

Marketing by Federations

(Continued from page 528)

promulgation of standards for Wisconsin cheese.

Future of the Cheese Federation

I am not afraid to go on record as saying a few words regarding the future outlook for the Wisconsin Cheese Producers' Federation. The present 14,000,000 pounds of cheese handled per year will be doubled in the next twelve months. In 1930 the Federation will handle 140,000,000 pounds of cheese, the product of 1,500 factories. By this time the price of cheese will be fixed solely by the law of supply and demand. The producer will get more money and the consumer will buy for less money.

The cheese dealer for years has been doing his utmost to get the cheesemaker afraid of the Federation. By 1930 things will have changed as then the Federation cheesemakers will have the best and most up-to-date factories and living quarters. By this time the Federation brand of cheese will be sold all over the world wherever Wisconsin cheese is offered.

By 1930 instead of 15% of the cheese grading No. 1-A, 75% will come under this grade. Nineteen thirty will prove that the standardizing of cheese has done more to improve its quality than has been done by all other combined forces up to this time.

By 1930, the moisture, the fractional weight, and the three-day from the press laws all will be a thing of the past.

By 1930, 75% of all American, Swiss, Brick, and Limburger will be marketed through the Federation.

I want to ask every milk producer in the state to support the cheese producers' federations. If a patron of a creamery, I urge you to join the creamery federation; if a patron of a condensery or ice cream plant, give your moral support to the federations.

Calves Suck Each Other

I have noticed several articles in your magazine regarding the ill effects that calves sucking each other have on their udders when they become fresh. Can you suggest any methods of stopping this practice?

Petaluma, Calif. E. H. S.

Stanchion young calves before feeding milk and just after milk has been taken, allowing calves to lick a mixture of meals. When their mouths and muzzles have been freed from milk and the taste of it they will not be so likely to suck one another's teats. If they should start doing so apply a little powdered aloes in oil to the udders.

SALE ANNOUNCEMENTS

April 19—Holsteins at Hudson, Ohio. W. C. Keenan.

Don't Wait for the Cow

(Continued from page 546)

and her gradually replenished herds, with the housewife's budget, strangely reduced, out of which must come flour and sugar and cereal and all the rest—leaving too little for milk expenditures. Against all these and more must the milk producer work and the leading minds of his own organization tell him over and over, more and more thoughtfully, that his only hope now is to pool his product and get one price for all, a price above any individual dealings because of 50,000 strong men acting as one man.

The milk business has not gone to the demnition bow-bows—yet. Like the Phoenix of old, it will arise from the ashes of indecision and distrust, stronger and greater and surer than even the more sanguine think possible—if we will only le. it. But the safety first pooling plan can't come to us and do for us unless we go after it and work for it and put it through ourselves. The W. F. C's, of this world rarely lead their own communities or add to their progress in any way. It is now up to 45,000 men to win over the needed 5,000.

Watertown, Wis., Spring Sale

There were too many young bulls that would be classed as only "fairly good ones" to permit of a high average at the Watertown Holstein Sales Co. Spring Sale held March 29-30 at Watertown, Wis. Taken as a whole, it was, however, a satisfactory sale with the 141 head bringing an average of just over $200. Without most of the bulls above mentioned and without a very few of the females a considerably higher figure could, of course, have been obtained.

O. H Erdman topped the sale with Sir Rachel Sadie Vale Homestead, a 30-lb. yearling grandson of King of the Sadie Vales. He was purchased by Emil Nitschke of Wisconsin for $900.

Harvest Farms brought out the best female of the sale, Harvest Agatha Segis, a very showy 2-year-old daughter of their Spring Farm King Agatha Pontiac from a 21.84-lb. daughter of Judge Beets Segis. She was a remarkably good individual, heavy in calf to Harvest Matador Segis, a son of Matador Segis Walker, and well worth the $750 R. F. Clark paid for her.

Mack, Hager, and Edwards did the selling with B. D. Scott in the box.

Following is a list of those animals selling for $250 or more and buyers:

Walter R. Lange, Wisconsin	
Piebe Oak Canary Fobes	$475
Fairlawn Stock Farm, Wisconsin	
Piebe Oak Canary Fobes	$475

Buyers at Brentwood Nationa

BELOW are listed the buyers of animals which sold at the Second Brentwood National for $500 or more. In last week's issue of Hoard's Dairyman a summary of this notable auction was published.

A total of 164 animals brought an average of $1,277. In the cut above Pietertje Prospect Colantha, son of Segis Pietertje Prospect, the 37,381.4-lb. cow, is shown on the auction block. On the sale board to the left is written the selling price of $27,100, which was paid by Huntington Valley Farm and Brentwood Farm. Below is shown Gertrude Titanic De Kol, winner of the $1,000 award as grand champion cow in the show held the day preceding the sale. She was consigned by Bell Farm, Pennsylvania, and purchased by Carl Schmidt of New Jersey for $4,050.

Have you tried the plan for making wool blankets and automobile robes from the wool which you cannot sell at a worth-while price?

There's a difference. An abundance of flowers will transform any old house into an admirable old home.

A Healthy Calf

—is the result, not only of good feeding, but of **protection** against germ infections, such as scours.

Experience has taught the wise cattle man to rely upon a good safe disinfectant. A bottle of B-K is his helpful agent. When used internally it destroys germs, acts as an anti-acid and sweetens the stomach, heals inflamed membranes, relieves irritation, restores healthy action. B-K contains no poison, acid or oil and may be given freely in the milk and drinking water.

Never be without B-K—You will surely need it—and, it is always ready. Sold everywhere.

For CUTS INFLAMATION CHAPS SORE TEATS CAKED BAG BUNCHES

BAG BALM
MADE BY THE KOW-KARE PEOPLE

Used and approved by dairymen everywhere

The real O. K. of any product is the extent of its use. Last year 50% more Bag Balm was used by dairymen than the year preceding.

Bag Balm promptly heals all cuts, chaps, scratches or inflamed condition of the udder or teats. Caked Bag responds quickly to its softening action. Very effective in treating Bunches and Cow Pox. Bag Balm comes in a liberal 65c package; at feed dealers, general stores or druggists.

DAIRY ASSOCIATION CO.,
Lyndonville, Vermont

Southern Guernsey Progress

HOARD'S DAIRYMAN:—The Virginia Guernsey Breeders' Association has lately been reorganized with the assistance of W. W. Fitzpatrick of the American Guernsey Cattle Club. R. H. L. Chichester was re-elected president and C. T. Rice was elected secretary-treasurer. These with Messrs. Wm. H. Gould and F. E. Saunders make up the executive committee.

The Association members have their shoulders to the wheel to help the state pure-bred sire campaign. They are offering to swap pure-bred Guernsey bull calves for scrub bulls with any farmer in the state who wishes to get out of the scrub class. There are no strings to the deal, all they want is to do away with the scrubs. Nobody has any excuse for sticking to the scrubs when they are offered an even swap.

They are also starting a campaign to advertise Virginia Guernseys. A prominent dairy educator who was touring the dairy sections of the state with a view to giving advice on how to better develop herds was more than surprised at what he learned. He traveled in Loudoun, Culpeper, Fauquier, and Fairfax Counties where he saw for miles rolling country on which herds of high grade dairy cattle were grazing or quietly resting in the shade along the numerous spring branches. It was no trouble to find spots where from six to ten silos could be counted at a time. In Loudoun County he found a Guernsey Breeders' Association whose members own over a thousand head of registered Guernseys and who employ F. H. James on full time as manager of their organization. The herds of Saunders & Myers and that of Governor Westmoreland Davis at Leesburg, the county seat, made him open his eyes.

Our educator then went to the Shenandoah Valley. There he met Fred Driver who runs one of the larges creameries in the state and takes i little else but Guernsey milk. Ove at Fredericksburg he met Captain M. B. Rowe who brought the Guernsey to Virginia over thirty years ago and still maintains his herd. Over the Rappahannock he met Judge R. H. L. Chichester, owner of the famous Glencairne Herd, who showed him two-year-old heifers milking as high as fifty pounds of milk a day. He could not understand the owner of Locust Grove Farm whose first two entries in A. R. averaged a little over 670 pounds of butterfat.

Wondering over these things and at the quality of the Guernsey herds which he found all over the state our extension man decided that the thing that would do Virginia breeders most good was to get out and advertise what they had and what had been accomplished in a few years from a most modest start. In 1907 when Westmoreland Davis turned his herd over to the United States Bureau of Animal Industry to prove whether they could clean tuberculosis out of a herd and keep it out, with the announcement that he intended to develop a herd of cattle that would be a credit to the South from a practically unknown breed, we thought that there was another good man gone wrong, but Westmoreland Davis was right and today his 1907 favorite is the favorite dairy breed all over Dixie Land.

Virginia is patiently waiting on the American Guernsey Cattle Club for the word to start a Guernsey milk campaign. In a few years instead of being used to color up inferior grades of market milk, Guernsey milk will be sold in all its glorious purity. It will be sold under a jealously guarded trade-mark purely on its merits and will be known by its rich yellow color and its superior flavor.

If the demand for Guernseys in the South could be satisfied at prices that other breeds are offered at, Virginia would soon be a back number as far as leading the South is concerned. Three southern state fairs are offering $2,000 or more in the Guernsey classes for 1921. Elaborate barns are not necessary for southern fairs, but some sort of a tight roof and room to place man, cattle, and junk are absolutely indespensable. Overcrowded show quarters are very dangerous and the breeder who expects to keep his cattle in good health must keep them from contamination in cars or showbarns.

Guernsey breeders of the Mississippi Valley will miss a great opportunity if they do not follow up the great start that the breed has got in the lower part of the Valley.—Southeastern Guernsey Breeders' Association.

The 1921 Syracuse Sale

With 61 buyers for the 259 animals of all ages that were sold, of which 175 head ranged in price up to $505, there was recorded an average of a little over $200. The 1921 sale of Holsteins, held in the Syracuse sale pavilion, March 22, 23, and 24 under the management of the E. M. Hastings Co., may be put down as having had few equals in respect to number of buyers, and also as fulfilling the prediction of the promotors that its offerings would not sell at extravagant prices. Carload shipments were purchased by G. E. Markley, Kentucky, J. G. Kerrick, Pennsylvania, and Angus P. Thorne, representing the Board of Public Charities, Connecticut. Purchases were also made for Syracuse University Herd and for the City Home Farms of New York.

The responsibility of making selections for the sale was placed upon the individual consignor in every instance, and, while many outstanding individuals were in evidence, it was evident that quite a number of the three dozen consignors represented took advantage of the opportunity to "weed out" their herds, with such results as always appear when a seller undertakes to market his undesirable animals. The consignors generally seemed to be content with the prices realized, and the purchasers appeared to regard the occasion as constituting an especially favorable buyer's market.

The Oil that Oils Better *in the* Can that Pours Better

The Top-Tip Can—all that the ordinary 5-gallon can is not.

The ordinary 5-gallon can —clumsy, heavy to lift, hard to pour — wasteful and inefficient in use.

TO make Tempered oil the ***easiest*** oil to use as well as the ***best*** oil to use is the spirit that produced the handiest, most common-sense oil "package" in America.

Here's what you'll discover the first time you buy a 5-gallon supply of

***In the* Wasteless Easy-Pouring Top Tip Can**

Wadhams Tempered Motor Oil

If Tempered Oil and untempered oil could be dissected to show their real structure, you would get a comparison similar to the views above—one, unbroken, firmly knit, ready for its duty the other shattered to the verge of breakdown — pre-crumbled by abusive uncontrolled heating in manufacture.

You'll find that the Top-Tip can eliminates the old temptation to "put-off" oiling—which is your most vital duty to your car. You'll find its generous home supply a protection against hit-or-miss methods of depending on spur-of-the-minute curbside fillings of unidentifiable grade.

You'll find that you no longer need to wrestle with a heavy awkward can. That there is no spilling, no wastage. That there is no smear of oil left on hands, clothes or floor.

You'll find that the Top-Tip can in your garage at home is a constant invitation to oil at the proper time and place, thus insuring longer car life. Ask your local Wadhams dealer to demonstrate.

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Some Teat Trouble

Many of the ailments that affect the teats of dairy cows might be prevented by more careful handling and management. It may be confidently asserted that perhaps a majority of the cases of sore and chapped or cracked teats which give the dairyman so much trouble are due to lack of attention to cleanliness. They would in most instances become quite rare were milkers to make it their invariable practice to cleanse the udder and teats of each cow before starting to milk. That is required in all "certified milk" dairy stables and prevents infective germs from causing troublesome sores and inducing ruinous attacks of garget. We do not advise that a clean towel should be provided for each cow or scented soap used in the cleansing process. Such ultra-refined attention is unnecessary, but a clean cloth should certainly be dampened and used to wipe off the loose scarf skin, dust, and other "foreign bodies" before each milking.

Filth in the stable and yard contains germs, the worst of which is that known as Bacillus necrophorus which causes the most serious sores. It is the one that causes canker sore mouth in all young animals and necrotic stomatitis or "calf diphtheria" which usually proves fatal. Cows should be kept from wading through filth in the yard or field or lying upon it in the stable. The high sill over which cows often have to step on entering the stable and which causes them to injure their teats should be done away with and stable stalls should be wide enough to give cows comfortable space and prevent them from stepping upon one another's teats. Any cow that has anything go wrong with her teats or udder should be isolated at once and kept separate until well. Germs are readily carried from cow to cow by the milker's hands. Disease spreads slowly but certainly in that way. The milker's hands should be carefully cleansed and disinfected before milking and his nails should be kept trimmed. Then the milking should be done with dry hands. Wet milking makes a soup of filth which runs down the teat and infects sores.

The worst sores of teats are those starting at the tip and making a scab which has to be picked off to allow milk to flow. Where this is done infection soon spreads up the milk duct and garget results. In many instances, too, a milking tube has to be used and if not perfectly sterilized or boiled for 15 or 20 minutes each time before insertion it will be certain to induce ruinous infection. Severe squeezing of the tip of the teat with the butt of the hand at the end of each pressure from above downward in milking tends to cause a callous at the end of the teat. This we call a "corn" and it is a common but unsuspected cause of hard milking. That sort of milking should be "unlearned".

When sores start the teat should be immersed night and morning, for 5 minutes, in hot water containing all the boric acid it will dissolve, or in a 1-1,000 solution of chinosol. Afterward dry the teat and apply a mixture of 1 part of tincture of benzoin and 3 parts of glycerine. Obstinate sores are well treated by applying strong iodin ointment. If that does not suffice apply twice daily an ointment

Hood Farm Abortion Remedy
and

. . . STATEMENT OF . . .
The Ownership, Management, Circulation, etc., required by the Act of Congress of Aug. 24, 1912
—OF—
Hoard's Dairyman

Published weekly at Fort Atkinson, Wis., for April 1, 1921.

State of Wisconsin, County of Jefferson, ss. Before me, a Notary Public in and for the State and county aforesaid, personally appeared Frank W. Hoard, who, having been duly sworn according to law, deposes and says that he is the business manager of the Hoard's Dairyman and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse of this form to wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are:

Publisher W. D. Hoard & Sons Co. Fort Atkinson, Wis.

Editors
A. J. Glover, P. C. Burchard, C. L. Burlingham Fort Atkinson, Wis.

Managing Editor A. J. Glover Fort Atkinson, Wis.

Business Manager F. W. Hoard Fort Atkinson, Wis.

2. That the owners are: W. D. Hoard & Sons Co., Fort Atkinson, Wis.; H. L. Hoard, Fort Atkinson, Wis.; A. R. Hoard, Fort Atkinson, Wis.; F. W. Hoard, Fort Atkinson, Wis.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

Signed, Frank W. Hoard, General Manager.
Sworn to and subscribed before me this 1st day of April, 1921.
Signed S. R. Jones, Notary Public.

"NOW-A-DAYS"
says the Good Judge

A man can get a heap more satisfaction from a small chew of this class of tobacco, than he ever could get from a big chew of the old kind.

He finds it costs less, too. The good tobacco taste lasts so much longer he doesn't need to have a fresh chew nearly as often.

Any man who uses the Real Tobacco Chew will tell you that.

Put up in two styles

W-B CUT is a long fine-cut tobacco
RIGHT CUT is a short-cut tobacco

Weyman-Bruton Company, 1107 Broadway, New York City

made of 1 dram of subnitrate of bismuth rubbed up with half an ounce each of carbolized vaseline and benzonated oxide of zinc ointment. Compound tincture of benzoin applied full strength 2 or 3 times daily often proves remedial.

Congested Udder

We have a nice pure-bred Holstein heifer, born Nov. 19, 1919, that unfortunately got with calf. We do not know the exact date she will be fresh but think about the middle of April, which will make her come in much too young. Her bag is getting quite large and seems to be hard and caked even now. Is there any treatment you can suggest to soften bag and prevent udder trouble with her?

Steuben, Wis. R. E. H.

It is natural for the udder to become congested before calving but in that condition it is important to keep the heifer from chilling or bruising the udder by lying upon a bare cement floor or cold, wet, or hard ground. Have her take exercise daily and keep her bowels relaxed. Massage the udder two or three times daily and at night rub in a little sweet oil or melted lard. If the congestion becomes excessive it may even be necessary to strip away a little of the serum or milk once daily.

Amaurosis

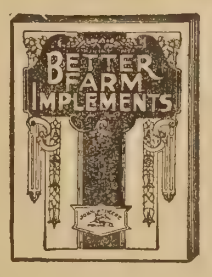
I have had two perfectly developed calves born which were totally blind at birth and never gained their sight. The mothers of these calves did not have the best of attention while carrying their calves and was wondering if this could in any way have affected the calves.

Newberry, S. C. F. G. D.

The cause of blindness in many cases of this sort is a mystery but as excessive bleeding or shock may cause it in any animal, it seems just possible that the sudden change in the blood circulation of a new born calf may have something to do with it, or bruising of nerves at time of parturition may have that effect. There is no known remedy for the condition.

Milk Costs in Washington

Data gathered by the United States Department of Agriculture in western Washington indicate that in the production of milk 56.4% of the total cost is due to feed and bedding, 23.5% to labor, 17.6% to other costs, and 2.5% to depreciation. In the production of 100 pounds of milk in the winter, 29.4 pounds of concentrates were required, 92.9 pounds of dry roughage, 143.3 pounds of succulent roughage, 9 pounds of bedding, 1.9 hours of human labor, 0.01 of an hour of horse labor, a charge for hauling and grinding of concentrates of $0.022, and a total of other costs of $0.576. Credits under winter conditions allowed for each 100 pounds of milk were 0.017 calves and 115 pounds of manure.



The requirements for producing 100 pounds of milk in summer were 5.2 pounds of concentrates, 7.5 pounds of dry roughage, 40.4 pounds of succulent roughage, 0.025 acre, 0.1 pound of bedding, 1.3 hours of human labor, 0.015 of an hour of horse labor, a charge of $0.003 for hauling and grinding of concentrates, and $0.406 for other charges. Credits under summer conditions with each 100 pounds of milk were 0.009 calves and 13 pounds of manure.

To keep the average cow for a year it was found that 1,187 pounds of concentrates are required, 3,336 pounds of dry roughage, 6,474 pounds of succulent roughage, 295 pounds of bedding, and 1.1 acres, a total cost of $23.04; a charge of $0.87 for hauling and grinding of concentrates, and a total of other costs of $36.31. During the year each cow was credited with a value of 2.2 tons of manure and 0.97 calves.

No Planter is Better than its Drop

AN inaccurate planter drops too many kernels in some hills, resulting in imperfect ears, nubbins or barren stalks; too few or none at all in other hills where the soil is capable of producing three or four big stalks and perfect ears. Any inaccurate planter is a poor investment—you lose money every day you use it. No matter how convenient the levers, marker, reel or other features, or how strong the frame, it is the dropping mechanism that determines this accuracy. When buying insist above all upon "accuracy."

FREE BOOKS—"More and Better Corn"—Tells how to select and test seed, prepare seed bed, plant and cultivate corn.

"Better Farm Implements"—114 pages, illustrates and describes not only corn planters, but every one of the leading John Deere farm tools—plows, harrows, drills, hay tools, grain and corn binders, shellers, elevators, tractors, engines—also other information of value to you—a reference book you will be pleased to keep on your table. Write today for a copy, address John Deere, Moline, Ill., and ask for package P-514.

JOHN DEERE

999 CORN PLANTER

The Accurate "Natural Drop" Planter

This planter's "Natural Cell Fill, edge-delivery seed plates" and sloping hopper bottom cause the kernels to enter the cells in a natural position—not forced—one to each cell and the right number accumulated and checked in the hill. The "counting out" process of the No. 999 secures the same accuracy as the hand-planting method.

The highest degree of accuracy is maintained not only when the planter is new, but year after year by the John Deere No. 999 Corn Planter. Repeated tests have proved this. Over fifty years specializing in the manufacture of corn planters has enabled this factory to develop such a planter, and each and every one must pass an accuracy test before leaving the factory.

The Variable Drop Device—a great feature—enables you instantly to change the drop to meet the various conditions of soil in the same field. By merely shifting a foot lever, without stopping the team or leaving the seat, you can vary the drop to two, three or four kernels per hill—always exactly the number desired.

Change from hilling to drilling or vice-versa made instantly by means of foot lever. Nine drilling distances can be secured without changing plates.

Plants great variety of seed without changing cut-off.

Automatic Marker requires no attention after starting in the field.

Fertilizer and Pea Attachments can be furnished—either one or both can be used when planting corn.

JOHN DEERE

JOHN DEERE MOLINE, ILL.

POSITIONS WANTED

Experienced milker. Single, age 25, Hollander, wishes position, either in cow barn or on milk route. Good habits. State wages in first letter. Address BOX 713, care Hoard's Dairyman. 12-2

Position wanted by two young men, brothers. Preferably together. West or midwest. Farm experienced. Address BOX 491, Delhi, New York. 12-2

Wanted—Position on small Holstein dairy farm in Wisconsin. Have done some A. R. O. work with good results. Single, age 27, Norwegian by birth, good refrences. State wages in first letter. Address BOX 714, care Hoard's Dairyman. 12-2

Position Wanted—By woman with two boys, 13 and 14 years old, take entire charge of house on farm or elsewhere. Competent to manage. Can take responsibility. Experienced. Would like to be near high school. The boys can milk, drive teams, etc., and want to earn something in the summer. Best reference. Address BOX 720, care Hoard's Dairyman.

Wanted—A position as assistant farm manager. Have experience in dairying, hog raising and general farming. Can give references. Married, have small family. Address L. RAMSEY, Dyersburg, Tennessee.

Position Wanted—As manager or herdsman, by May 15th or sooner. South preferred. Excellent references. Address BOX 719, care Hoard's Dairyman. 13-2

Position wanted as cow tester, herdsman or dairyman. Address BOX 718, care Hoard's Dairyman.

Herdsman available (single). Developed world record cows and animals which sold up to $10,000. Herd in charge of one of the very leaders in prize winning money. Life long experience in every branch of care, development and management of the black and whites. West or middle West preferred. Best of references. Give full particulars in first letter. Address BOX 717, care Hoard's Dairyman. 13-2

Position Wanted—By single man, age 23. Experienced as herdsman, buttermaker and as general mechanic. The best of references. V. J. FULLER, Bark River, Michigan.

Position Wanted—Single man many years in charge of dairy herds as milker, feeder and calf raiser. State your best proposition for attention, salary, board and room. M. L. RILEY, Barrington, Illinois.

Position Wanted—On high class farm handling, testing and showing cattle. Am Wisconsin man and have good record. Address BOX 716, care Hoard's Dairyman.

Herdsman, dairyman or assistant. Experienced A. R. O. fitting and showing. Short course. Best references. American, 21. Pennsylvania preferred. Address BOX 725, care Hoard's Dairyman.

Wanted—Position as dairy farm superintendent. College trained and 15 years' experience. Have always been well liked and successful. Not a floater. Am a real dairyman and farmer looking for a real job. Not the kind looking for a raise every day, but don't want pre-war salary any more than you want pre-war prices. Southeastern states preferred. Address BOX 726, care Hoard's Dairyman.

Farm manager, energetic, capable, desires position on large farm, will manage same scientifically and economically and make it pay. Experienced in purebred stock. Advanced Registry, modern farming, orcharding, machinery, tractors, etc. Married, no family. Excellent references. Address BOX 729, care Hoard's Dairyman.

Position Wanted—As manager of a large registered Holstein farm by married man who is well equipped to handle a large proposition. Agricultural College graduate. Experience in buying, selling, advertising and record-making. Excellent references. Address BOX 728, care Hoard's Dairyman.

Farm manager, working agricultural education, experienced in every operation connected with modern methods general farming, dairying, swine, poultry, orcharding, desires situation. Address BOX 711, care Hoard's Dairyman.

Gloomy Prospects?

HOARD'S DAIRYMAN:—Like most all business men, we farmers were caught in the slump and our markets are over-supplied. Unlike the manufacturer, we could not close up our shop in July or August. We had our high priced seeds, with high priced fertilizer and labor already stored in Nature's wonderful machine. We had to go through with it to the end, regardless of profits, or lose all we had invested.

For the past few years we have been so busy producing that some of the things not immediately related to production were neglected. It seems to me that of all years this is the year to do the postponed jobs—the things that make farm life real living, the things that bring our boys and girls to think that our farm is the best place in the world. Clean up the home grounds, plant a few shrubs and flowers. Most farm boys and girls will enjoy helping in this work, but we older folks have to have the vision and help them to see it. Added to this is the planting of fruit and keeping a good vegetable garden. These will bring satisfaction and health, as well as delicious food that money can seldom buy. Perhaps our buildings are crying for paint. Let's not neglect them longer, for to do so will hurt our pride and later on our pocket books.

This year we can increase our profits by adopting more efficient methods. Take the one thing of watering stock. I believe that I saved nearly two hours a day from having installed a simple water system that cost me approximately $150.00. It not only saves time that I can give to other work but the stock is always certain of having an adequate supply of water when they need it.

Again, why not make 1921 the year to set up a sane dairy program? If our cattle are not selling well it makes it all the easier to test out and dispose of all tubercular animals, as well as to cull out the lower producers down to a point where our farms will furnish all the roughage and grains to feed them except, possibly, a little high protein concentrates. If every dairyman will adopt this program, we will all have larger incomes and better markets.

This is a big world and regardless of tariffs or any other artificial means to keep up prices, we must get the manufacturer's point of view. We cannot afford to go on producing all the dairy products possible regardless of cost or the efficiency of our cows.

While I am still a young dairy farmer at the foot of the ladder, I am going to succeed and bring up my children to love farm life. Hoard's Dairyman certainly hits the right spot with me. Your optimism is sane and contagious.

Erieville, New York. L. M. O.

Cream Grading in Kentucky

HOARD'S DAIRYMAN:—The managers and field agents of creameries operating in Kentucky met at the State University on March 29, and decided to adopt a system of cream grading. It is planned to teach the cream buyers to distinguish between good, bad, and off flavored cream, so that a report may be made to each farmer regarding the quality of cream he is producing on his farm. Any farmer who produces cream that will make 92 score butter is to be encouraged, while the farmer producing cream that will make 87 point butter is to be taught how to handle cream. A card will be attached to each can of cream at the country cream stations to show to which grade it belongs, and when the can arrives at the creamery the judgment of the buyer will be verified by the expert butter maker. The college will help in an educational way in this splendid work. J. J. HOOPER.

Kentucky College of Agriculture.

A Successful Co-operative Creamery

HOARD'S DAIRYMAN:—A farmers' co-operative creamery at Stevensville, Montana, is singularly successful, according to the observations of a representative of the Dairy Division, United States Department of Agriculture, who recently visited the plant. Other than producing 3,000 pounds of butter daily, the organization manufactures ice cream and artificial ice, and collects eggs. The top notch market price is commanded for butterfat and at the end of 1920 a dividend of from 5 to 10 cents a pound of fat was distributed to the patrons.

The Bitter Root Creamery, the name of the mutual farmers' organization, differs from most of the other creameries in the state in the methods of conducting business. Sour and off-flavored cream is discountenanced, the patrons being urged to observe practices that will insure a sweet product when delivered to the creamery. Obedience to this standard of procedure has paid handsomely in dividends. The egg-collecting venture likewise operates under a watertight contract, only strictly fresh eggs being permissible for marketing. According to specifications the eggs are gathered twice daily and delivered to the creamery. Failure to comply with the regulations, three violations by one patron, signifies expulsion from participation in the advantages of marketing eggs through the creamery. The ban is without extenuating conditions, being permanent.

The creamery retails artificial ice for 25 cents a hundred pounds, and markets in ton or wholesale quantities at a rate of 20 cents per hundred pounds. Other than the profits accruing from this sideline activity, an adequate supply of ice is available to the patrons for cooling of cream and other household uses. During the past summer a large cold storage building was erected and two refrigerating machines are in continuous operation at the creamery and storage plant. The marketing problem, an ever-present uninviting condition in many similar co-operative ventures, seems to be solved at Stevensville. It is the inferior product which suffers most on an unfavorable market.

A co-operative undertaking is frequently successful by reason of the wholesome influence of one or two men. The representative of the Dairy Division attributes the progress of the Bitter Root Creamery to the faculty of leadership demonstrated by its manager, J. H. Howe. He is vice-president of a local bank, an evidence of the confidence in which he is held in the community. Mr. Howe is the promoter of dairymen's meetings, when speakers from a distance are obtained to talk to the patrons about methods contributing to profitable dairying. "It is undoubtedly owing to his efforts that a higher quality of raw material is received at the creamery than is the case in most western creameries," concludes the representative of the Dairy Division. "And in looking over the factory it appeared to me that he was able to get more and better work done with fewer men than I have observed to be the case in most creameries for years. To secure the maximum efforts cheerfully from each fellow worker means good team work and indicates ability to handle men." S. R. WINTERS.

Use of Liquid Manure

HOARD'S DAIRYMAN:—While no one questions the advisability of using the utmost care in conserving the liquid content of manure, its use when separated from the solid portion of the waste is not apt, as a rule, to be attended with as good results as though the two were used together. There are exceptions to this, of course, for the liquid portion of manure is employed sometimes to advantage as a quick "starter" in spring on crops which must be hastened in their growth at a season when the decay of organic matter has not as yet entered into its mid-summer swing. In ordinary farm practice, however, there is no advantage to be gained in employing liquids and solids separately.

Manure, at best, is poorly balanced as a food for plants. When the solids and liquids are separated, the balance is even less desirable. The liquid contains approximately four-fifths of the total nitrogen and two-thirds of the potassium. The solids hold practically all of the phosphorus. If liquids and solids are distributed separately on the same field the soil is apt to receive in spots rather more of one and less of the other than though the application were made in the usual fashion.

Where manure is stored in a pit that is provided with a cistern for receiving the leachings of the waste the separate distribution may be avoided by pumping the liquid over the solids before the waste is taken to the field.

Spraying Saves Alfalfa From Weevil

Alfalfa, that crop upon which thousands of stockmen and dairymen depend for a luxuriant supply of feed, has been threatened in many sections by the ravages of the alfalfa weevil. This pest is responsible for the loss of hundreds of thousands of dollars annually to alfalfa growers in Utah, Idaho, Colorado, and Wyoming. But there is a remedy—a sure one—which seven years of experimental work by the Bureau of Entomology, United States Department of Agriculture, has demonstrated will, when properly applied, as completely destroy the weevil as the weevil, when unmolested, will destroy the alfalfa crop.

The cost of applying the remedy is trifling when compared with the results. It consists in spraying with arsenical solution, the proper application of which is described in Farmers' Bulletin 1185, Spraying for the Alfalfa Weevil, just published by the United States Department of Agriculture.

Tests Prove Successful

Seldom has any newly recommended method of insect control been so thoroughly safeguarded against failure as alfalfa weevil spraying, say entomologists of the department. Every season for seven years it has been tested and proved successful. During one season field trials were conducted in co-operation with farm bureaus in the course of which over 4,000 acres were successfully sprayed by practical farmers, many of whom were without experience in any kind of spraying. The Farm Bureau News of Sevier County, Utah, reports a saving of $15,000 by this means, and estimates from other sources raise the total to $40,000.

The spray can be made with arsenate of lead or arsenate of zinc, both of which have been used with complete success. Where arsenate of lead is used the poison is weighed or measured for use at the rate of 2 pounds of powder, or 4 pounds of the commercial paste, to each 100 gallons of water. It is prepared by stirring the poison in a little water until it becomes a thin paste without lumps. It is then diluted and strained and 2 pounds of laundry soap, which assists in making the solution spread more readily and stick to the leaves, is added.

There is practically no danger of burning the foliage of alfalfa. To be most effective, the spray should be mixed just before use and kept stirred up so as to prevent the settling and wasting of the poison and clogging of the pipes in the spray pump. Care should also be taken to keep out all dirt and lint which might interfere with the free passage of the solution through the spray nozzle.

It is important that the spray be applied at the proper time, which is when the young larvæ of the weevil become so numerous that they completely destroy the growing tips and thus stop the growth of the alfalfa plants. Spraying before this time will fail to catch all of the weevil, and if the application is delayed the pest will destroy so much of the crop that it will be beyond recovery.

In the field infested with the weevil the tops of the plants are as white as if they had been frost bitten. The injury spreads downward and before the normal cutting time, if the field is allowed to stand, the whole plant is bare of leaves and the green cover has been stripped from the stems. Before this state is reached, or usually about one or two weeks before the first crop is ready for cutting, is the proper time for spraying. If the larvae have been poisoned through spraying of the first crop, the second crop sprouts and grows without delay and no further treatment is necessary.

Spraying Time Limited

As the proper time for spraying is limited, it is essential that all preparations, such as securing the spray material and overhauling or repairing the spray machinery, be done in advance. Spray nozzles designed to give a misty spray, sometimes called hollow-cone, eddy-chamber, cyclone, whirlpool, and cover-spray nozzles, are best for this work since the purpose is to make a fine, even coating of poison upon the upper foliage where the larvae usually feed. The character of the spray produced by a nozzle of this type depends principally upon the pressure. With pressures below 75 pounds, many of the spray particles collect into drops and roll off the foliage. As the pressure increases the spray becomes finer and covers the foliage more completely. As the success of the work depends largely upon covering as nearly as possible all of the sprayed foliage, the pressure should not fall below 75, and might well be kept at 100 or more pounds.

The type and size of spray pump used depends upon the area which is to be covered. Any pump, with brass lining, valves and pistons, capable of delivering four-fifths of a gallon or more per minute, and maintaining a pressure of 75 pounds, can be used for this purpose. The best results have been obtained with nozzles working two feet above the alfalfa, each nozzle, as it moves across the field, spraying a strip two feet wide. The spray pump should be regulated to deliver 100 gallons of spray mixture per acre. At this rate the actual cost of spraying is about $1 per acre, of which approximately 60 cents is charged to the poison.

The spraying of alfalfa for the weevil does not injure the crop for feeding, and will not harm farm animals. Many of the cattle which are fed upon it probably take in more arsenic with their drinking water than with their hay, and, as for the lead content, few of them would under any circumstances live long enough to show the least affect of it, according to the bulletin.—U. S. Dept. of Agriculture.

Bloat

I would like to know if warm skimmilk, fresh from the separator, with the foam caused by separating, would cause bloat in hogs. I fed two sows five gallons skimmilk and about a gallon of corn and mill-run twice a day. They ate their feed in the evening and the next morning one of the sows that had pigs about 3 weeks old was dead.

Lacomb, Ore. R. L. P.

"Yes. Foam should always be removed for it tends to cause bloating of calves or hogs. Hogs are particularly liable to die suddenly from suffocation when bloated. We have seen such deaths caused when hungry pigs had suddenly been turned into wet clover or rape, to which they had not been accustomed. Any sudden change of feed may have a similar effect. A post mortem examination should, however, always be made to determine the cause of death, cholera being such a common cause that vaccination may be in order to save remaining hogs.

MINNESOTA-HOLSTEIN-BREEDERS
THIRD ANNUAL CONSIGNMENT SALE
The State Sale Classic of the Year

Holstein Breeders
Reserve May 3-4-5
Be at Faribault, Minn., on Those Dates

3 Big Days

3 Big Days

May 3 — The State Meeting

Minnesota Holstein breeders will hold their annual meeting on that date. You are invited to attend whether you live in Minnesota or elsewhere. We want to know you better; we want you to know us better. This will give us all that opportunity. Come. We promise to entertain you.

May 4 — The Third Annual State Sale

Our annual sale on May 4th will be better than any we have ever held, regardless of what the final average price is. Without exaggeration, we have the best lot of Holsteins ever consigned to a Minnesota sale, and we believe a better lot than were ever brought together for any state sale anywhere.

The 80 head to be sold are the best that the sale committee could find in the barns of Minesota breeders. They come from 55 different herds and they are a splendid representation of the best the breed affords.

We know they will please you. It will be worth your while to be with us on May 4th.

May 5 — Rice County Breeders' Sale

There are always breeders who attend Minnesota's Annual State Sale who are not in a position to buy animals of the remarkable quality that are sold. They want good Holsteins, but for one reason or another do not feel that they can buy the tops of the breed.

The Rice County Breeders' Consignment Sale on May 5th will meet their needs. It includes 70 very good Holsteins, young cows and bred heifers which it will profit any breeder to own.

Make your plans now to be with us May 3-4-5

This Week We Offer

Sir Bess Ormsby DeKol 297182

Born December 13, 1919

An Outstanding Individual—Ready for Heavy Service

He Traces Three Times to Sir Pietertje Ormsby Mercedes, the World's Greatest Long-Distance Sire

His Sire—*Sir Bess Ormsby Alice*

A coming young sire whose offspring are of real show type. His dam is Alice Tritomia Ormsby, 34.42 lbs. in 7 days and 1033.94 lbs. butter and 22,035.5 lbs. milk in a year. She is sired by Sir Pietertje Ormsby Mercedes 21st and from a 25-lb. granddaughter of Homestead Junior De Kol. The sire of Sir Bess Ormsby Alice is from Bess Pietertje Ormsby Mercedes, 33-lb. 1,235-lb. daughter of Sir Pietertje Ormsby Mercedes and Spring Brook Bess Burke.

His Dam—*Shady Netherland DeKol 4th*

She has just made 25.15 lbs. butter and 579.5 lbs. milk in 7 days at just 36 months of age. She is on yearly test and should make well over 800 lbs. She is a beautiful individual, sired by a son of Buffalo Maid 2d, junior champion at the National Dairy Show 1913. She is by Sir Pietertje Ormsby Mercedes and from Buffalo Maid, 30-lb. 900-lb. maternal sister to Pietertje Maid Ormsby. The dam of Shady 4th is a 20-lb. daughter of Sir Netherland De Kol de Freule.

PRICE $500.00

A Son of LIEUTENANT RAG APPLE

from a 7/8ths sister to a 948-lb. junior two-year-old daughter of a 1,281-lb. cow. $100.00. Let us tell you about him. Serviceable.

BLUEBELL FARM, Riceville, Iowa

This is not a cheap premium knife. It is made of a special steel called "Carvan" and would sell at $1.25 to $1.75 at any store. I have carried one for three years and I know.

We'd Like to Send You This Knife

With your name and address on one side—and a picture of the Hoard's Dairyman Office and Farm on the other side of the handle.

We will send it to you—postage prepaid, made up especially for you—if you'll do a little something for us.

Right now we are making a special offer on a subscription to Hoard's Dairyman. We are offering the rest of this year and all of next year for... **$1.25**

Almost two years for just a little bit more than the regular price for one year.

We want every farmer who has cows to hear about this offer.

IF YOU'LL TELL TWO—JUST TWO—OF YOUR NEIGHBORS ABOUT IT, AND SEND IN THEIR SUBSCRIPTIONS, WE'LL SEND YOU ONE OF THESE KNIVES, MADE UP ESPECIALLY FOR YOU.

You don't need to write much of a letter. Just say: "I am enclosing two subscriptions for the rest of this year and all of next year—with remittance of $2.50. Send me that knife you advertised." That's all there is to it!

HOARD'S DAIRYMAN

FORT ATKINSON, WISCONSIN

M. & P.

Healthy Holsteins

A year ago we sold a bull calf to a Virginia breeder. The dam of that calf has just finished a year's record of 17,600 lbs. of milk, 800 lbs. of butter. Was he pleased? His letter states "The bull is growing nicely, and I am glad his dam made so good a year's record."

We supply this kind at moderate prices. Write

BUY DIRECT

Reasons for Buying Holstein Cattle in Waukesha County:

1. You can buy direct from the breeder through the breeders' association, organized by the breeders to promote the breeding of more and better Holstein cattle and to assist in a fair marketing of the same.
2. There are over 50 pure-bred Holstein sires in service in Waukesha County whose dams have records of over 30 lbs. butter in 7 days or 1,000 lbs. butter in a year.
3. There were 1,307 long-distance tests made on Holsteins in Waukesha County during the past year, which is more than the total in the next four leading counties in the state.
4. There are more tuberculin tested cattle in Waukesha than in any other county in the world.
5. The breeders' organization is in a position to put you in touch with "bred-for-production-stock" at reasonable prices.
6. When buying through the Association, you obtain the services of men who devote their entire time to the Holstein industry. It saves you time. You get more for your money.

35 HEAD Wayne Potter's 35 HEAD

First Annual Holstein-Friesian Sale

To be held at the farm 5½ miles Northeast of Neillsville, Wis., and 4 miles Northwest of Granton, Wis.

WEDNESDAY, APRIL 27, 1921

The offering of this sale includes several cows bred to (and most of the young stock sired by) Duke Pietertje Korndyke Ormsby 8th, a 985-lb. son of Duke Pietertje Korndyke Ormsby that sold for $33,000 last spring. Several of the cows and heifers are bred to my show bull, King Pietertje Ormsby Piebe 10th, that won 4th place at Waterloo Dairy Congress and Chicago National last fall. His two nearest dams average 1,217.23 lbs., both under full age. Several of the bulls offered are ready for service. Most of them are from A. R. O. dams. Herd is under Federal Supervision.

Sale to start at 1 o'clock sharp. Outside parties will be met at Neillsville or Granton, Wis.

Auctioneers: Col. W. Krause and J.P. Heintz. Art Imig in the Box.

WAYNE POTTER, Write for Catalog. **NEILLSVILLE, WISCONSIN**

Foundation Females

Two Excellent Young Bulls

Consigned to

The Waukesha Spring Sale

April 25-26

When the sale committee came to us for a consignment, they demanded good ones and they took several we would like to have retained in our herd.

Among them are:

PAULINE DE COLANTHA 3RD—25.38 lbs. butter, 572 lbs. milk in 7 days; 103 lbs. butter, 2,357.1 lbs. milk in 30 days.

BELLE TETTJE JOHANNA KORNDYKE—23.65 lbs. butter, 656 lbs. milk in 7 days; 90.38 lbs. butter, 2,476 lbs. milk in 30 days as a 4-year-old.

Two other 4-year-olds with 23 lbs. and 24 lbs. butter in 7 days.

A 14-lb. junior 2-year-old daughter of a 33-lb. 3-year-old and by "It".

A son of a 14-lb. junior 2-year-old daughter of KING MODEL. Her dam is a 29-lb. daughter of KING OF THE PONTIACS.

A son of a 24-lb. cow and a grandson of SIR PIETERTJE ORMSBY MERCEDES.

Look these up in your catalog. If you want further information, write us.

Lake Mills Holstein Breeders'

23d Semi-Annual

Consignment Sale

Thursday, May 5, 1921

The Lake Mills Sale Co. wishes to have Real Sales, and Real Cattle to Sell.
To help make this possible they employed Mr. Ben Berg, Lake Mills, to Select and Improve the Consignments.
Every Animal Offered Has Passed His Inspection.
Nothing will be sold unless accompanied by a Registration Paper, or Signed Application for Registry.
All animals not coming from Federally Tested herds will have been recently tested for Tuberculosis by Reliable veterinarians. Sold under the usual 60-day guarantee.
Everything in the sale Well Bred, and Many Have Fine Records. It will be as Choice an Offering as Lake Mills has ever placed in the Sale Ring.

Here Are a Few—

A 29-lb. cow, one with 28.90, a 27-lb. cow with 800 for a year, 24 lbs., 23.78 lbs., a 20-lb. show cow.
A 29-lb. yearling bull. Also a dandy from a 19-lb. 2-year-old, and sired by a Son of King Segis Pontiac Count.
Daughters and Granddaughters of 29-lb. cows.
Heifers from record dams, sired by a Son of King Pontiac Champion and bred to a Son of Carnation King Sylvia and from a Daughter of Matador Segis Walker.

Consignors—

Chas. Beveridge, Lake Mills.
Kenneth Crump, Lake Mills.
Faville Homestead, Lake Mills.

French Brothers Dispersion Sale

70 REGISTERED HOLSTEINS

Shipman, Ill., April 27, 1921, 10 A. M.

An unusual opportunity to secure the cream of over ten years of constructive breeding.

To be Sold — King Mutual Korndyke Eighth, King Chloe Hengerveld Ormsby

King Mutual Korndyke Eighth is now 2½ years of age; his dam has a yearly record of 1,313 lbs. of butter and 26,246 lbs. of milk. His sire's dam is the world's only 1,200-lb. yearly record 2-year-old.
King Chloe Hengerveld Ormsby is nearly two years old. His dam is that wonderful cow, Chloe Pietertje Ormsby, a daughter of Sir Pietertje Ormsby Mercedes. Her yearly record of 1,149 lbs. was made at 4 years and she has three yearly records all made in heifer form that average over 1,000 lbs. She is a former world's champion. His sire is the $65,000 bull, Sir Pietertje Ormsby Mercedes 41st.
COWS AND HEIFERS of real quality. These cattle will make good for the beginner or for the big man. Some complete families of our best.
12 cows with long time records. 25 beautiful daughters of the 33-lb. bull, King Korndyke Sadie Gem De Kol. Sons and daughters of the great yearly record herd sires.
Write for catalog and arrange to come. This is the best herd of Holsteins ever dispersed in the Middle West.
Health: Herd is under federal test, but one reactor in over 6 years, a 60-day retest privilege given.
Terms: Bankable notes will be acceptable for any period up to one year. 1% discount for cash.

Location: Shipman is midway between St. Louis and Springfield, Ill., on the C. & A. R. R.

30—Quality Holsteins—30

A 32-lb. Jr. 4-year-old and Her Son — A 30-lb. Cow — An 18.84-lb. 2-year-old Daughter of a 31-lb., 1270-lb. Cow and Her Daughter — 25 Splendid Heifers

Consigned to the Waukesha Spring Sale — April 25-26, 1921

PAEONIE DUCHESS VEEMAN PONTIAC
30-lb. granddaughter of Sir Veeman Hengerveld

The Wellington Family to be Sold

A 32.07-lb. junior 4-year-old daughter of FAIRVIEW PONTIAC BEETS KORNDYKE and her yearling son by a 28.71-lb. son of K. K. S. V. She will be fresh at sale time.

An 18.84-lb. 2-year-old daughter of WELLINGTON VASHTI KORNDYKE (31 lbs. in 7 days, 1,270 lbs. in a year), she another daughter of FAIRVIEW PONTIAC BEETS KORNDYKE. Her yearling daughter also by this sire will be sold.

FAIRVIEW PONTIAC BEETS KORNDYKE is one of the best sons of PONTIAC KORNDYKE. He now has 6 daughters over 30 lbs.—one with 1,270 lbs. in a year.

A Second 30-lb. Cow

PAEONIE DUCHESS VEEMAN PONTIAC is a 30.44-lb. granddaughter of SIR VEEMAN HENGERVELD and of SIR KORNDYKE MANOR DE KOL. She is heavy in calf to a 37-lb. son of KING SEGIS PONTIAC ALCARTRA.

25 Heifers — A 3-yr.-old — 2-yr.-Olds — Yearlings

A 3-year-old daughter of PABST PONTIAC HENGERVELD from a daughter of KING OF THE PONTIACS. Her sire is a son of KING PONTIAC CHAMPION from a 33.86-lb. daughter of DE KOL 2D'S BUTTER BOY 3D. She is a heavy springer.

The 8 two-year-olds are splendid individuals and all are bred to PABST PONTIAC HENGERVELD for fall freshening.

10 of the yearlings are from the same dams and are sired by my junior herd sire, a son of PABST PONTIAC HENGERVELD. They are good ones.

The 6 long yearlings are daughters of L. H. C. ALCARTRA, he a 29.58-lb. son of KING SEGIS PONTIAC ALCARTRA. Some of them are bred to PABST PONTIAC HENGERVELD.

I am selling the best part of my herd because I plan to sell my farm shortly. They are healthy and are sold subject to a retest. Look them up in your catalog and write me for further information.

AUG. SEEFELDT, Theresa, Wis.

Every grain producer and grain dealer will be interested in the announcement that the Chicago Board of Trade has just appropriated $2,500 to further the work of the Horse Association of America. This brief announcement is of far-reaching significance. It means that the greatest grain market in the world has recognized the menace to grain sales resulting from the displacement of horses and mules by motors. It means that the methods of the Horse Association, in giving reliable information on the use of horses, are approved by the greatest Board of Trade. It proclaims the position of the grain men in no uncertain terms.

"As hard as fire and water can make them"

—The Disston file-maker

Disston makes between sixteen and eighteen million files a year. Some weigh a tiny fraction of an ounce. Others 135 lbs. Some are for a lady's fingernails. Some for gigantic chunks of steel.

The supreme test of a good file is in filing the teeth of saws—steel cutting steel. And nearly a half-million Disston Files are used yearly in making Disston Saws—"the saws most carpenters use." No wonder Disston Files eat through the work in quick time! No wonder the experienced filer enjoys the feel of a Disston File as it bites into the toughest metal!

Disston Files are Disston-made from the steel to the packing case. They are of good, true steel, "as hard as fire and water can make them."

Send for new free booklet, "The File in History."

Does the Show Ring Fulfill Its Purpose?

H. P. DAVIS, IDAHO

DOES the show ring fulfill its purpose? This question raised by Professor Woodward in a recent issue of Hoard's Dairyman is a much discussed one. Certainly the show ring is far from perfect as a means of establishing type, yet it has many advantages as anyone will admit. Judges, it is true, are far from perfect and as long as men are human there will be differences in judgment. Of the points that were raised in the article either a lack of ideals on the part of the judges or a different interpretation of the value of different parts of conformation, the former may well be dismissed as far as important shows are concerned. As to the second, there is a wide variation in the type that breeders are striving for.

Consultation of any breed history or the early pictures of the animals will demonstrate how different was the type of animals prevalent a generation ago. Now these changes of type have come about through the efforts of the constructive breeders and the show ring has played no little part in presenting the change to the country in general for approval or disapproval. A certain dairy breed now has a pretty well fixed type which has been developed rather generally throughout the country. The singleness of type prevalent in this breed has been brought about quite largely through the efforts of a particular judge who, for a number of years, has officiated at the more important shows. The breeders, also, have been unsually willing to let him set the type. In some of the other dairy breeds, the breeders have been unwilling to follow the type set by any single man or group of men with the result that the type is far from uniform.

Particular sections of country have developed certain ideals of type in one of the dairy breeds and the breeders are not anxious to have these modified as would likely happen by obtaining a judge from another section. All this makes for confusion in the minds of inexperienced breeders and prevents the breed from attaining a desired uniformity. This condition is very likely to continue to exist, however, as long as the government of breed organizations is democratic. In a way the very fact of variations is encouraging since it indicates that breeders are not completely satisfied with what they have so far attained.

Two points, and to my mind important ones, that Professor Woodward did not bring out in the discussion of animals being reversed in different shows, is the question of condition and showing. Condition is always important in the show ring and a slight variation may easily cause one animal to be placed below another. To illustrate: Showing usually presupposes a journey to the show. The animal makes the trip to the first show of the circuit in good condition. At the first show it contracts scours, or hoof rot, or anyone of a dozen things so that upon arrival at the next show it is feeling far from fit. Perhaps it fails to eat well, or perhaps the water is not to its liking, at any rate it appears in the ring a little "slab sided" with the hair a bit harsh. A judge may easily put the animal down a number of places below animals that at other times were inferior. In fact, last year that very situation happened in two shows at which I officiated, where the competition was close between two animals. In this particular case the owner of the two animals expressed himself as well satisfied.

Another point, and a very important one, with young animals is the question of growth. Dr. Eckles has demonstrated by measurements what breeders had long observed, namely, that animals grow unevenly. Perhaps one month there is a gain in height at the withers and no increased height at the hooks and the next month the reverse takes place. Anyone who has picked out and shown a herd of young animals is all too well acquainted with these facts.

Comparatively few persons who are not intimately acquainted with the show ring realize to what a large extent "showing" influences the placing of awards. If anyone has struggled, as I have at some of the smaller shows, to get those showing the animals to show them in such a way that their true merits could be gauged, they will appreciate how hard it is to do justice in judging. The expert showman also very often by his skillful display of the animal's strong points so impresses the judge as to win honors not well deserved.

Any discussion of the show ring, its standards, and the ideals of type must consider all the points affecting the placing of the awards.

Keep White Grubs Out of the Corn

Severe injury from white grubs is to be expected this season throughout southern New York, northern Pennsylvania, northern Ohio, the southern half of Michigan, northern Indiana and Illinois, eastern Iowa, and southern Wisconsin. Every three years these regions are visited with outbreaks of these pests, because of the fact that it takes three years for the insects to pass through their complete life cycle. There will be an abundance of small grubs this year of what is known to entomologists as "Brood A" of the white grub. They will occur especially in fields that were in grass last year, and for this reason throughout the regions mentioned neither corn nor potatoes should be planted on such land, because these crops will almost surely be severely injured if this be done. Ground that was in pure clover or even in corn last year is likely to be quite safe for planting to corn this year, because the bettles which are the parents of the white grubs do not usually lay their eggs in such crops. A good rotation of crops to escape white grubs is as follows: First year, oats or barley; second year, clover; third year, corn. Timothy or other grasses harbor white grubs from year to year, and, therefore, in case they are grown, the land producing them should not be planted to corn, at least for the first year after it is broken from the sod.

Farmers' Bulletin 940 contains full information on white grubs and may be obtained free on application to the United States Department of Agriculture.—U. S. Department of Agriculture.

THE FARMER AND HIS FRIENDS

M. H. WATSON, KANSAS

"Let me live in a house by the side of the road and be a friend to man."

THERE is an old farm many miles away that I used to visit often when I was a boy. As we went along the public road toward the place, we could see the house off to the northwest, perhaps half a mile away. But from the place where we reached the corner of the farm to the end of the lane up which we turned, we could not see any of the farm buildings. First we had to pass a row of willows, then a long thicket of wild plum bushes, and lastly a high bank with a wire fence clinging to its top. For the first few rods as we went up the lane there was no house in sight, but as we rounded a little hill we could see the house and barn off to the north a quarter of a mile away. Down we went across a deep ravine on a rickety little bridge and then through a level stretch and up a hill to the house. In wet seasons the level part of the lane was almost impassable. The old people who lived there used to say that in thirty years they had never been bothered by a tramp or a peddler. In these later years there is little danger of having any of their poultry run over by automobiles passing on the public road. There are advantages in having a home so located.

I know another farm home that is very differently situated from the one that I have just described. It is on the main road just outside a small village. The house is not grand but comfortable-looking, white with green trimming. It is surrounded by some fine old trees. There is a good well temptingly near the road. The barn is large and red. There is plenty of live stock about the place. I often notice a neighbor's team or auto standing in the well-traveled driveway south of the house.

It seems to me that these two farm homes represent two different kinds of lives that are today being lived on farms. There is the shut in life that is occupied with its own interests but is not very closely in touch with other lives. And there is the friendly life that is in intimate contact with other lives, sharing the joys and sorrows of humanity. Much is being said today about the breeding of better live stock, about maintaining and increasing the fertility of the soil, about the co-operation of farmers in marketing their crops, but there is no need more vital to the farmer than plenty of friendly intercourse with his fellowmen.

An old Roman philosopher once said: "There is no better way to realize the value of friendship than to suppose that some day God would take you away from the society of your fellowmen to some delightful place and there supply you with all the comforts and luxuries that heart could wish. You could not enjoy wealth or anything that wealth could buy if you were absolutely separated from the rest of mankind." There may have been a few lonely seasons in your life when you have realized the truth of this.

Friendship a By-product

If the making of friends seems to be a man's principal business, we suspect that he intends to run for office or we conclude that we do not fully understand the scope and nature of his operations. Most worth-while men are closely identified with one of the common business callings. They are farmers, doctors, mechanics. From his business a man expects to make a good living and to lay by something. Through his business he may hope to make his mark in the world and do some noteworthy public service. But as he follows his calling his life touches other lives here and there and at each point of contact there is the possibility of finding a friend. If he is a farmer, he must exchange work with his neighbors. He must borrow and lend. He must buy and sell. He may have to consult a doctor or sit in a dentist's chair. He may put himself in touch with his state experiment station or he may join one of the great farm organizations. If he is fair and friendly he may soon have a number of friends.

Another illustration of the way friends come to us is obtained from the country church. A church is primarily a place for religious instruction and worship. But in the church some of our most helpful friendships are made and developed.

The Subjective Side of Friendship

Do you know that your world, the real world in which you live, depends more upon what you are than upon the people and circumstances that surround you? We have a way of transposing ourselves over into our friends' shoes. If I have an unkind and uncharitable way of judging my friends, I can feel that same unkind criticism coming back to me. If I have a friendly, charitable attitude, I can feel my friend making excuses for me though he says nothing. If I am prone to take small advantages of my friends, I will be always ready to sense some return of the same. If I see a neighbor's good qualities and emphasize them in my own thought of him and treat him in a friendly way, the chances are ten to one that he will be a good neighbor to me.

The Sifting Process

But there is a sifting process in friendship. How many people have you known in your life? Take a moment and make a rough estimate. Would you think five thousand? Maybe you have known ten times that many. How many intimate friends have you had with whom you shared your inner life, your aspirations, your plans? You knew they would understand. They would discreetly keep your confidences. They could listen patiently, advise you frankly, trust you freely; you could feel their weaknesses, their strength, their needs. You have not had many such friends; three or four persons, possibly ten. Between these very best friends and your merest casual acquaintances are to be found the various stages or degrees of friendship.

Hindrances to Friendship

Circumstances prevent us from really knowing many of our acquaintances. We do not live near together or we move in different circles. We are not enough interested in each other to cross the natural barriers. But there are certain barriers that a man places around himself and that keep him from being rich in friends.

One of these is insincerity. You would hold back a little from a friend who is two-faced, though you may admire his other sturdy qualities. I feel almost certain that a friend of mine talks uncharitably about me behind my back because he talks uncharitably about all his other friends to me. To their faces he is just as affable as he is to mine. Insincerity sometimes appears in other forms that would be harder for me to endure.

Perhaps you have a friend who lacks a sense of humor and you enjoy having a little fun. Perhaps your friend holds a higher opinion of himself than the facts seem to justify. Perhaps he wants too much public recognition, wants to manage everything in sight. Or perhaps it is against you that these charges are heaped up by your friends. Petty trespassing and unbusinesslike arrangements have spoiled a lot of good friendships.

The Responsibility of Friendship

An old proverb says that a bad apple spoils all the other apples in the basket. We have a number of contagious diseases, mumps, measles, scarlet fever. We even catch colds from one another. A bad boy may contaminate all the boys at the country school. We all recognize the contagious character

(Continued on page 606)

MAKING THE SEED BED FINE

Quality in Tractor Work

J. L. JUSTICE, INDIANA

MANY good words have been spoken in behalf of the tractor in the way in which it has helped farmers out of labor difficulties, enabling them to accomplish their work in a shorter time or with fewer hands and giving them the advantage of getting the crops in in time or the harvesting done under favorable conditions. This is a side of tractor farming that seems to be emphasized most strongly as it well deserves to be, but oftentimes there are other advantages that are lost sight of especially in handling the soil.

A question most frequently asked of me by neighbors and farmers who are looking into the tractor farming business, is: "Does tractor plowing and preparation of the soil measure up to that of the horse drawn implements in quality of work done? It has been shown by certain methods that the pressure of the tractor on the soil per square inch is less or no more than that of the horses' feet, but do you find in your experience that the tractor packs the soil more than horses or causes more clods to turn up?"

These are natural questions and good ones for farmers to discuss. Personal experience with tractor farming and observation of the results of work done with our tractor and others in the neighborhood leads me to believe that many prospective buyers do not examine thoroughly enough the work the tractor does. It is impossible to judge the work from the road, as is sometimes done. Months before we purchased a tractor, I went to many fields where tractors were working under various conditions to see what could be done with them. I heard of tractors condemned because they were doing a poor job of plowing or that they were packing the soil in such a way as to be harmful, but the trouble I concluded in every single instance was not with the make or type of tractor, but with the way in which it was handled and in improper adjustments of plows.

I saw one two bottom plow which was designed to cut twenty-eight inches being pulled along at the rate of better than three miles an hour and cutting more than thirty inches. There was much criticism of the work being done and unfortunately the tractor got the blame from many. The same results would have obtained with horses if the plows could have been pulled at the same rate with the same excess cut. I was convinced long ago that tractors could do absolutely as good work pulling plows as could horses, and no horse plowing on our farm has ever excelled that done with the tractors, which includes three different kinds or types of tractor used.

Many times after plowing the soil is so broken and pulverized in turning by the plows that it is loose and mellow enough to go right in with a light harrow to put it in excellent shape for planting with one trip over. The tractor pulled plows travel a little faster than horse drawn plows; there is a slight tendency to throw the dirt over rather than to turn it slowly and this serves to break up the furrow slice and give it the pulverizing action that cannot be accomplished with any other kind of a farm implement. This feature of tractor plowing permits of quick working of the soil into a seed bed. While the same or a somewhat similar result may be obtained sometimes with horse-drawn plows, the results are not so uniform in different kinds of soil throughout a field.

We have found that the tractor plows will turn under stalks or trash better than horse drawn plows, this being due largely to the fact that the plows can be set deep enough to cover all the trashy material. This makes a clean field which is easily cultivated without breaking down the corn. Heavy growths of rye and sweet clover are easily turned under and all sod is cleanly and efficiently covered. Clean plowing is one of the features of tractor plowing which adds pleasure to the work. Whenever trash is left exposed between the furrow slices it proves a nuisance all through that season if a cultivated crop is grown on the land, so if it is gotten well under the soil it will not only be out of the way but will decay and form plant food more rapidly.

"With the tractor pulled plows," says Mr. Justice, "there is a slight tendency to throw the dirt over rather than turn it slowly as with horse drawn plows. This serves to break up the furrow slice and to give a pulverizing action that cannot be accomplished with any other kind of farm implement."

As to packing of the soil, a great deal of harm may be done with a tractor the same as when horses are used under similar conditions. It is a bad policy to run over the ground when it is too damp or wet to do so. It will most surely pack the soil. When this soil is plowed it will more than likely turn up cloddy where the tractor passed over if the soil is such as to become cloddy.

One redeeming feature is that the tractor farmer has such a large plowing capacity that he need not go onto his soil until it is in just the proper condition to plow without danger of packing. He can choose his time to do the best work, thus avoiding running over or plowing soil not in fit condition. Where there are wet spots in a field the tractor of course may have to plow through these, but I have never yet seen such soil packed any worse with a tractor than with horses.

I have heard the complaint also that in plowing a field in headlands the continual running across the unplowed ground on the ends tends to pack the soil considerably. This is true, but by proper laying out of the headlands and care in turning on the ends the soil need not be injured by the practice. Narrow headlands will be advantageous in preventing running over the same ground so much, then a careful driver need not follow the same tracks all the time. There are other methods of laying off lands that can be followed just as easily as that of laying off in headlands. It would be necessary to go into detail to explain them and it would be well for the prospective or new tractor owner to study the advantages of all methods of laying off lands before attempting any one method. A little study of others plans and experiences is very helpful both in choosing and operating a tractor.

What Drainage Has Done for Middle West

G. E. WARREN, ILLINOIS

WHEN the sturdy pioneers streamed across the Mississippi Valley three-quarters of a century and more ago they selected the higher grounds for their homes and farms to avoid the swamps and bogs. Millions and millions of acres were under water a part of the year and millions more were partly under water at times, and with no ditch cutlets or tile drainage, the lowlands were worse than useless. In Lincoln's boyhood in Illinois, the farms around the quaint little village of New Salem where he lived were situated in higher areas such as could be farmed without drainage. Hilly and rolling ground was more in demand because of natural drainage than the more fertile deep soils of the stream bottoms and endless flat prairies.

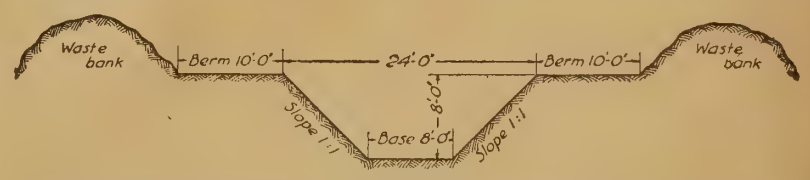

Fig. 1. This waste of land might be utilized for farming by the use of closed tile drains. The drains would also make the fields easier to handle and avoid the expense and trouble of bridging the open ditch.

REPLACES A WASTEFUL AND INCONVENIENT DITCH
These are 38-inch concrete drain tile placed in trench and ready for back-filling. The entire area can now be farmed and there is no necessity for bridges.

Romantic as the pioneer period was, and thrilling as the fireside stories of early settlers still living are, the modern development of farming now in progress in the Mississippi Valley through reclamation of wet lands by drainage, surpasses in national value and importance the agricultural growth of any other period. Nearly enough fertile land in the United States remains unused because of lack of drainage to feed our entire people. Unlike the reclamation of the arid vastnesses of the western plains, the middle west swamp lands have been and are being reclaimed without federal or state aid financing. There are today south of the Mason-Dixon Line, according to a well-known authority on land drainage, seven million acres now in organized drainage districts. Another authority states there are one hundred to one hundred five million acres of swamp lands in the middle west and south, and that there are more than two hundred million acres of fertile lands that need tile drainage to make them tillable and productive.

The state laws of the middle western states have provided amply for co-operative methods of handling drainage work. The methods under the law differ to some extent in the various states. Taking Illinois, for example, as typical, there are three separate forms of co-operative drainage which may be used. One farm cannot be drained independent of the neighboring farms unless it so happens that a stream crosses the farm, furnishing natural outlet drainage. In this vast prairie country this is seldom the case

Branding and Dehorning Chutes

IVAN D. WOOD, NEBRASKA

THERE are many types of branding and dehorning chutes in use today, each with its desirable and undesirable features. Some cattle men favor the stationary chute since it can be built more substantially than the portable kind; others favor the portable chute since it can be moved from one ranch to another or used in several locations on the same ranch. Mr. W. H. Campbell, a county agricultural agent in Nebraska, made a study of the different kinds of branding and dehorning chutes in use in that state and combined their desirable features in the designs shown in Figs. 1 and 2.

The essential features of the frame are shown in Fig. 1. The sills are two 4x6 inches, 9 feet long while the corner posts are 6x6 inches bolted to or morticed to the sills. The entire frame must be well braced with 4x4 inch material as shown in the figures. The floor board is a 2x12 inch plank, while the sides are covered with 2x8 inch as shown at "M" Fig. 2. The "squeezer" is built upon an "A" frame made from 4x4 inch pieces 9 feet long. The "squeezer" hinges on a piece of 1½ inch gas pipe at the bottom.

Many chutes have sides solidly boarded up from top to bottom. When an animal is caught with the squeezer in this type, there is more or less danger of injury. It will be noted that the sides of the chute here described are boarded part way and are then fitted with 1-inch gas pipes, spaced about 9 inches apart and firmly set into horizontal 6x6 inch pieces. The bars being vertical fit in around the hips, shoulders, and ribs holding the animal firmly with very little danger of injury. When an animal enters the chute the front door is shut and the "squeezer" is in a down position; this allows plenty of room for freedom of movement. At the desired time the lever at "T", Fig. 2, is pushed down and hooked to the ratchet pins on "S". The pushing down of this lever pulls the ½-inch rope which passes over the pulleys at "X" and "Y", Fig. 1, and raises the "squeezer" to a vertical position. The animal is held firmly in a "V" trough formed by the side of the chute and the "squeezer". While the floor board is a 2x12 inch, it is essential that the distance between the bottom of the squeezer and the side of the chute be not more than 8 inches. By referring to Fig. 1, it can be seen that the sides of the chute slope outward at the top to give the "V" or trough-like effect.

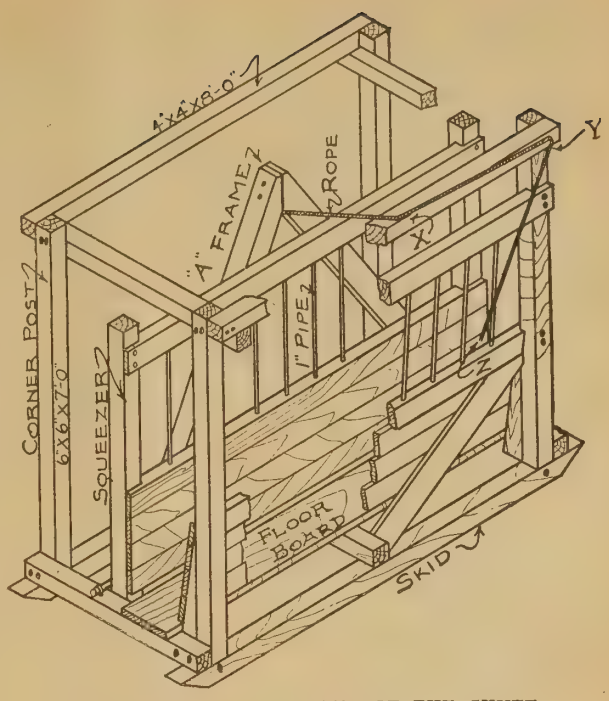

FIG. 1. SHOWING THE FRAME OF THE CHUTE

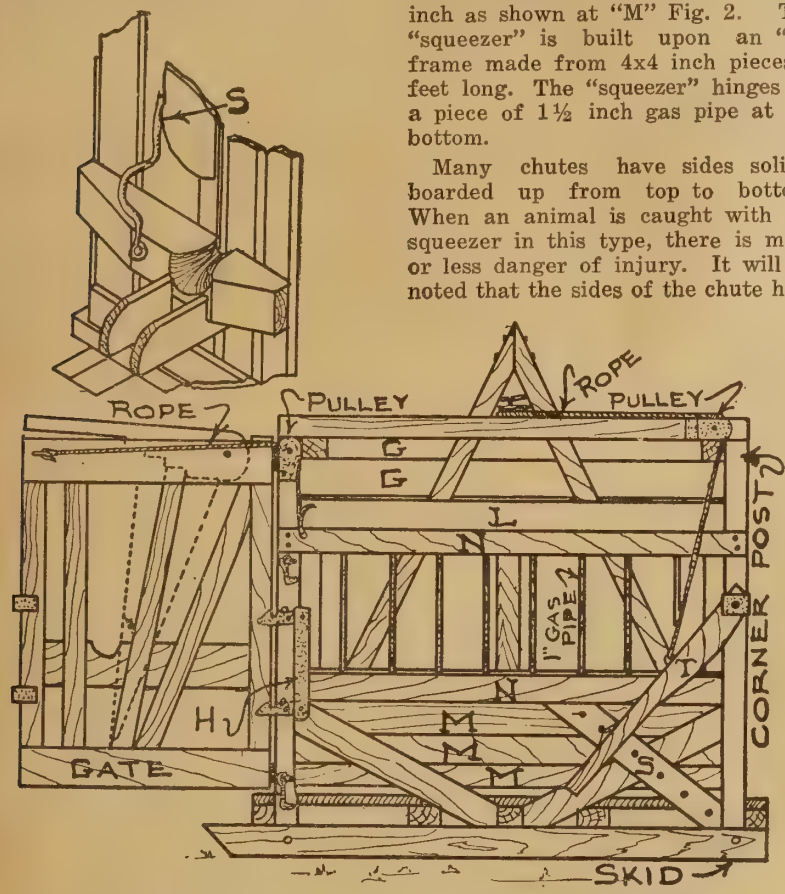

FIG. 2. FRONT VIEW OF THE CHUTE WITH THE GATE OPEN. TOP—PARTIAL FRONT VIEW OF THE GATE

The gate construction is shown in Fig. 2. It should be hung with heavy strap hinges. If the top hinge is set so that the top of the gate is held out slightly, it will swing open without the use of springs or weights. When swung shut with the rope it is automatically caught by the double hooks shown at "H", Fig. 2. Two stronger safety hooks are also provided.

The animal's head is held firmly in the stanchion. This stanchion is adjustable to different sized cattle. The dehorning device presents somewhat of a problem. Some breeders use a heavy canvas nose bag type, the animal's head being snubbed into position with a rope passed just back of the horns. The dehorning attachment shown in Fig. 2 has been successfully tried and does not injure the animal. It consists of two pieces of 2x8 inch rounded off at the end as shown and spaced to receive the nose; the jaws and neck rest across the heavy timber and the head is held in position by the piece of heavy gas pipe marked "S". In the drawing this gas pipe is shown cut away. In reality it must be long enough to give the operator considerable leverage. The entire structure must be made taller if used for branding horses.

SUCCESSFUL SOLDERING

It Pays to Patch This Day and Time. Anybody Can Do a Good Job of Soldering if He Will Follow a Few Simple Rules Outlined Here

R. U. BLASINGAME, PENNSYLVANIA

WHEN the barn roof leaks and spoils a ton or two of hay, it is time to stop that leak. If the ten-gallon milk can leaks, it can be soldered and made as good as new. A soldering outfit doesn't cost much. To solder up a hole takes less time than to tell about it if the man knows a few things about how it is done and will be clean about it. Being clean with a soldering job means to have a clean "soldering iron" (generally known as a "soldering copper") and have it properly tinned and remove all the rust and scale from the object which is to be soldered. Apply the flux and do the job. Soldering is simplicity itself if these general rules are followed.

It doesn't cost much to have a simple job of soldering done by a mechanic but when the barn roof leaks, the tinner from town has to charge for his time in going and coming and for transportation, thereby making a little job cost big money. The actual job may be quite a small one and might as well be done by some one about the place.

Soldering is a process of combining two similar or dissimilar metals together by a third metal with the use of heat.

Use of Flux

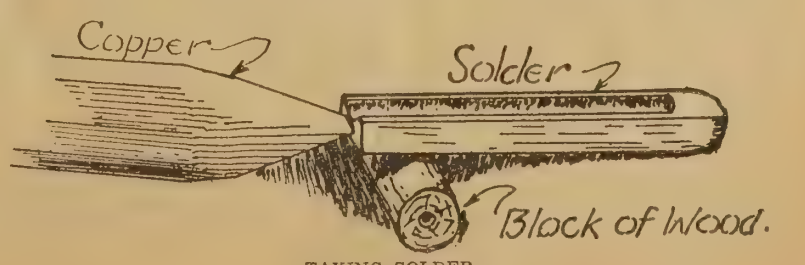
A flux is used to prevent oxidation of the heated surfaces, both the metals which are to be united and the soldering metal. Flux also renders solder more fluid, runs fast, and enters small crevices and cracks.

Resin is one of the most used fluxes, especially for soldering brass and tin. It melts and flows over the heated surface and excludes the air.

Borax is used for hard soldering and brazing on account of the fact that it will stand high heat while the resin will not.

Borax is also used for welding steel. Pure sand may be used in welding also. Lime may be used as a flux for welding steel.

Chemicals, like charcoal, salt, soda, etc., when incorporated with the flux, will reduce metals back to original form. They are called reducing agents.



Tinning the Copper

The "soldering iron" is generally called a "copper" because of the metal from which it is made. One of the first and most necessary steps to a good job of soldering is to first tin the soldering iron. There are several methods of tinning the copper. The first step in the tinning process is to clean off the oxide which always accumulates on the copper. This may be done with a file, scrape, or sand paper. The tinning process may be done in three ways: (1) Dissolve all the zinc that a half cup or any quantity of hydrochloric acid will take up. The acid may be obtained at any drug store; the zinc from a worn-out dry cell. The cup of the dry cell is made of zinc. When the copper is hot, file it bright and dip it into the acid and zinc solution. The acid attacks the copper and places a film of zinc over the copper. (2) The resin method consists in filing the hot copper to a bright surface and then rub it with a piece of resin. Then it is tinned by rubbing it with a stick of solder. The filed surface must be rubbed with the resin immediately because a second's time will allow the air to form an oxide over the surface. (3) The copper may be tinned with a brick. Scratch a slight groove in a soft brick with a cold chisel and leave the dust in the groove. Now melt some resin in the groove and also a few drops of solder. Next rub the hot copper in the groove in the brick. The soft brick will shine up the copper and the resin will exclude the air while the solder will coat the iron.

Solder

The solder for certain jobs is important. For soldering tin a solder of equal amounts of lead and tin is probably best. This is sometimes called "half and half solder". For roofing the solder should be mostly lead. For joints on brass or lead, the solder should be high in tin. The solder which contains most tin melts

TAKING SOLDER

SELLING MILK THROUGH A COMMISSION

Producers, Distributors, and Consumers Equally Represented in Setting Detroit Milk Prices

MILK producers in the Detroit district trust the selling of their milk to a Commission. Farmers are represented on the commission, as are the distributors and consumers, and the price is set by compromise agreement. Neither the man who milks cows nor the one who delivers the product to the kitchen doors of Detroit has more to say about prices than does the man who foots the bills at the month's end.

The Detroit Milk Commission has been in operation since 1916, with the exception of a few weeks this winter when it refused to take the responsibility of making the heavy reductions in the returns to the producer. At present its members are: a representative appointed by the Detroit Board of Commerce, one by the Detroit Federation of Women's Clubs, one by the Detroit Federation of Labor, Professor A. C. Anderson, Ex-Governor Fred M. Warner, J. N. McBride, Ira R. Waterbury, and Fred L. Woodworth. According to an agreement made by the producers and distributors January 26th, 1921, and later approved by this commission, the price for 3.5 per cent milk f. o. b. Detroit in March and April is $2.51 per 100 lbs.; in May and June, $2.31; and during the following four months, $2.71. A four cent differential is made for milk testing above or below 3.5 per cent. These prices are on the basis of a 13 cent milk at retail. If milk retails for 14 cts., the July price to producers will be $3.03, and in August, September, and October, $3.10. Seventy-five per cent of any increase above 14 cents goes to the producers.

Surplus Sets the Price

As in other markets, surplus sets the price in Detroit. Even a commission cannot regulate supply, or maintain a uniform demand throughout the year. In January R. C. Reed, secretary for the Michigan Milk Producers' Association, wrote, "With increased production resulting from the increased number of cows and also from the increased production per cow, we have found ourselves unable to steady the price to any extent that would give the farmers an adequate return for the money and time invested". Up-state farmers whose surplus is not handled by a local market have offered to deliver milk into Detroit during the past three months for as little as $1.50 per 100 lbs.

Coincident with over-production has come a period of marked underconsumption. Detroit has probably suffered more than any other city through deflation, nearly a quarter of a million men losing their regular employment. This cut down the consumption of milk at least 20 per cent. At this time about 75,000 gallons are distributed daily. The amount, according to the city's largest milk company, should be near 100,000 gallons.

The combination of these two circumstances, marked increase in production and a drastic cut in consumption, made necessary so great a reduction to the producer from the price of $3.80 in November and $3.00 in December that the Commission declined to set the price, leaving it to the producers and distributors to agree upon a basis. That the price schedule for the following months, as given above, was not reached without difficulty is indicated by the statement of the Secretary in January that "a crisis is on, the like of which we have not known since the Milk Commission has been serving the people" and his complaint that by the proposals of the distributors, "the distributor would get more than the farmer, and some months very much more. The farmer would then be doing as he has always done, getting what was left after others had been taken care of".

Work of the Commission

The Detroit Milk Commission meets once a month and passes judgment on the milk prices of the city. Among its members are men well informed on the production and the distribution of milk. Also it has members who know what the public is willing and able to pay for its milk. When all facts have been carefully weighed, a price is set. From its first meeting the Commission has given much attention to costs. Its dependence has been largely placed in the myth, "cost of production plus a profit". This worked well for a time but when that stern old arbitrator, supply and demand, made "cost plus" ridiculous the Commission was forced to throw up its hands and pass the buck to the producers and distributors themselves. Then the men who had something to sell met the men who wanted to buy and accepted the best price they could secure. To this the Commission gave its approval.

In general the work of the Commission has had an excellent effect. Besides establishing prices which have been acceptable to those who produce and retail milk, it has the confidence of the public. The justice of this milk tribunal has not been questioned. The producers say: "We want the Commission. We do not want to go back to the old way of having a continual fight in selling our product." Mr. Reed says: "We feel hat no greater service has been rendered by any body of men or women during the past four years than that of the Detroit Milk Commission."

Surplus Not Handled

Under the present agreement with distributors, the producer takes care of the surplus, the distributor contracting for the quantity needed. No adequate system of disposing of surplus has been inaugurated. Though the increase in cow population has been less in Michigan than in the country as a whole, the advice to cut down the number of cows by weeding out those which are least profitable has not been followed enough to prevent a steady increase in total production. Now farmers have a large surplus and no market for it.

The surplus plan being followed is far from satisfying to the owner of cows. Part of the supply is simply cut off from the Detroit market. This is done by stations, "shutting off certain ones for one month, then others for the next month, and so on until the supply shall come to normal". While this divides the loss, it makes it necessary to find a new market in various sections for a short period, or waste production until the station or stations in the restricted territory are opened for Detroit shipping.

So important is the surplus problem that the association plans to handle at least a part of the "peak load" itself, in one or more association-owned manufacturing plants. At a meeting March 11 a resolution was passed favoring the appointment of committees to report plans for the organization and operation of such a plant or plants and authorizing the directors and officers to act. A study has been made of the creamery started by the Dairy Division at Grove City, Pennsylvania, where equipment is installed for turning milk into the market channel offering the best returns. That kind of plant is favored. It is expected that the first will cost about $100,000 and will be located in a surplus area. If it is successful other plants will be established.

The Producers' Organization

The Michigan Milk Producers' Association was organized in 1916 and has grown to a present membership of 17,500. The purposes to which it works are: "to establish the producer in the confidence of the people, to secure as large returns for milk as is consistent with a stabilized industry, and to get returns to the producer as quickly as possible without entering into complicated transactions". While the Association's principal work is within the Detroit milk shed, considerable help has been given to outside districts in an advisory way.

The contract into which the members enter with the association is reproduced on this page.

The association is financed through deductions made from the shippers' checks by the distributors. The producers authorized a charge of one per cent for 1921. The officers have cut this to two cents per hundred pounds. Since the association now owns no property for handling milk, this charge is used entirely in operating expenses. At the annual meeting October 19, 1920, resources totalling $40,702.27 were in the association's treasury, accumulated, according to Mr. Reed, because the officers "have felt that sometime, somehow, a crisis would come which would test the organization most severely". Such a "crisis" came April 6, 1920, when the Federal Fair Price Commission decreed that Detroit milk should sell so that the producer would receive $1.30 less per 100 lbs. This was in effect six days and made a loss to producers of over $10,000 per day. By securing a permanent injunction against this action the association saved much more money than its cost since its organization. The injunction was made possible through the use of data collected by the Milk Commission.

The operation of the Detroit Milk Commission has not pleased everyone. No one expected such a dairy millennium. Some distributors have been forced out of business by the margin allowed for distribution; some producers have been dissatisfied—one local threatening to strike last August, even though the price secured was $4.10 per hundred pounds. But the producer, the distributor, and the consumer in the Detroit area all testify to the fairness of the Commission and all favor its continuance.

Application and Agreement

This agreement, made this ——— day of ——— A. D. 192—— by and between the Michigan Milk Producers' Association, a Michigan corporation of East Lansing, Michigan, and ——— of ——.

For and in consideration of the benefits and advantages to my business, and in consideration of all the mutual undertakings and agreements and advantages to both parties hereto, it is agreed that I hereby apply for membership in the Michigan Milk Producers' Association, and contingent upon the acceptance of my application, I hereby constitute and appoint the Michigan Milk Producers' Association my agent with full authority to sell all milk produced by me, reserving only such amounts as are required for my family use.

And I hereby agree to the following:

First—To produce and handle my milk in a cleanly, sanitary manner, and to remove the animal heat by cooling immediately after it is drawn from the cow, and in such production and handling to observe, put in practice, and follow the rules and regulations pertaining thereto as laid down by the Detroit Board of Health.

Second—To allow the Secretary or properly appointed agent of the Michigan Milk Producers' Association to enter upon my premises and inspect my cows, cow stable, cooling rooms, and dairy equipment, and, if the same are found to be unsanitary, to correct the faulty condition.

Third—To submit all serious controversies as to weight and test of milk to the Michigan Milk Producers' Association for adjudication and settlement.

Fourth—To allow the Michigan Milk Producers' Association, as compensation for its services as my agent, one per cent on all milk sold for me, which amount is to be deducted when payment is made for the milk, and request that fifty cents shall be paid from this amount to the publishers of the Michigan Milk Messenger as my subscription to that paper for one year from date hereof.

Fifth—To deliver my milk at ——— to ———

Sixth—This is a continuous application, authorization, and agreement, but may be revoked by me during the last ten days of December in any calendar year by serving written notice on the Secretary of the Michigan Milk Producers' Association that I desire to discontinue the same.

Seventh—The violation of this agreement shall be considered full and sufficient cause for cancellation of my membership in the Michigan Milk Producers' Association, and in case of any violation of this agreement, I agree to forfeit to the Association, as stipulated damages, all amounts due me for milk at the time of violation of said contract.

Signed and accepted by the Michigan Milk Producers' Association.
By ——— Selling Agent.
N. P. HULL, President.

Tom King Makes a Start

One of the 241 Club Members of Pennsylvania Who in 1920 Owned and Cared for 379 Pure-bred Animals Valued at $67,259

C. G. McBRIDE, PENNSYLVANIA

TOM King of Mercer County, Pennsylvania, is a fair example of an all-round successful dairy club member. He is now well established with pure-breds but he has not done anything that is beyond the reach of any live young fellow who joins a dairy club and sticks to business as Tom has done.

Mercer County is a good dairy county in western Pennsylvania. That part of the county within a radius of fifteen miles of Grove City, which includes the King farm, has undergone a remarkable development in dairying in the last five years. The impetus came with the establishment in 1915 of a creamery under the supervision of the Dairy Division of the U. S. Department of Agriculture. It soon became apparent to the people of the community that they needed more and better cows. The creamery fieldman, the Grove City National Bank, and the County Farm Bureau together worked out a plan for the introduction of some pure-bred cattle. The farmers were quick to avail themselves of the opportunity to get the right kind of foundation stock, carefully selected, and in the fall of 1916 several car loads of pure-bred cows were imported.

In this development the farmers were thinking in terms of a long time development for the community's dairy industry and it was only logical that they should decide early to take in the young folks. Here's where Tom and forty-nine other boys and girls found opportunity beckoning to them to come along. They did not hesitate.

The Grove City National Pure-Bred Dairy Cattle Club was organized in the spring of 1917. A car load of fifty-three calves was brought in from Ohio and fifty of them were distributed by lot to as many ambitious young folks who had caught the vision of a wonderful dairy community in the future and wanted to be in on the ground floor. In the car load there were twenty-three Holsteins, fifteen Jerseys, and twelve Guernseys. The Grove City National Bank accepted notes in payment from all club members who desired to finance the deal in this manner. Membership in the club was open to boys and girls between the ages of 8 and 21 years. The rules provided that each member must actually own a pure-bred dairy calf, heifer, or cow and agree to give it good care and keep a record of the feed. Reports might be called for at any time and each club member would be expected to show his or her heifer at the annual creamery patrons' picnic where prizes were provided by the bank. Tom King took an active part in the affairs of the club. The second year he was elected to its executive committee and is still a member.

On the day of the distribution Tom was not the most pleased boy in the group of fifty. In fact, when he went home he was just a little blue and that is one reason we are giving his story. He wanted one of the biggest and best Guernseys in the lot and in the drawing he got one of the smallest ones priced at $85. There were only two below her.

This is what he had to say about her in a story he wrote sometime later: "I was somewhat disappointed the day our names were put in the hat to be drawn out to tell us which calf was ours. I had hoped to get a larger and better looking calf than I did but had to be satisfied with the one I got. She was quite poor and rough in the hair but I decided to make the best of it and do what I could for her. I began feeding her skimmilk and a pint of oats twice a day. I also gave her clover hay and I watched every day to see if she was improving. I did not notice much change in her so decided to look for lice. We found an abundance of the pests. We immediately applied plenty of sheep dip and in a few days gave her another application, and soon the lice were all gone. She soon began to improve and get slick in the hair and by fall she was quite a different looking calf. At the Grove City Creamery Show in the fall she took first prize and also at the Mercer fair the same fall. She won first prize at the Mercer fair in 1918 and also first in 1919. On July 3, 1919, she gave birth to a fine heifer calf which bids fair to be as good a prize winner as its mother."

Tom's willingness to make the best of what he thought was rather a bad bargain and his perseverance in the care and management of the heifer brought him big returns. These qualifications also led him into other honors. In the summer of 1919 in a contest within the club membership

TOM KING AND HIS GUERNSEY COW, GROWN FROM A CALF OF LOW QUALITY TO A PRIZE WINNER BY GOOD CARE AND FEEDING

Yield of Each Cow Figured for You

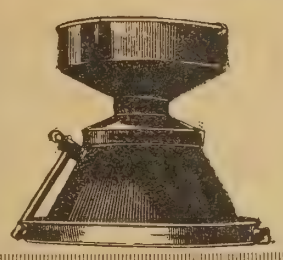
By the *CP* Pail Balancing Scale

Has two indicators. Weighs the milk in the pail. Eliminates errors. First hang the empty pail on the scale. Turn the thumbscrew in the center of the dial, which moves the red indicator until it is at the 0 mark, thus balancing the weight of the pail. Then add the milk or cream and the result shown by the red indicator gives the net weight of the milk or cream, and at the same time the black indicator gives the gross weight of pail and milk.

The capacity of these scales is 30, 60 and 120 pounds, according to size, in pounds and tenths of pounds. With each scale we furnish special blanks that will contain the record for two milkings a day for one week for 14 cows.

The scale can also be used for all weighing purposes.

Price each, 30 lbs. capacity by 1-20 lb. $4.85, 60-lb. $6.65, 120-lb. $8.85. Extra records per dozen, 15c.



Price each Postpaid (East of the Rockies) 4.85

OAKES & BURGER CO.

(Established in 1873). Cattaraugus, New York

You Need HOT WATER Your Stock Needs HOT FOOD

Heat BOTH in the Farmers' Favorite Feed Cooker and Agricultural Boiler

Don't sit by and watch your profits fall off through feeding stock chilled food and ice water. Give them warm food—they'll thrive on it and give you more and better milk. Hogs have larger frames and more solid meat; hens lay better. Have plenty of water for scalding, boil spraying mix, render lard, boil sorghum or sap, heat water for stock, for washday, preserve fruit. Burn chunks, long sticks, cobs — anything. Guaranteed. Write for prices.

BETTER FARMSTEADS

H. B. WHITE, MINNESOTA

THE farmer, with his many duties and responsibilities, has not been able to give the time and study to the arrangement and planning of his farmstead and buildings that he knows they should have. This has, in many cases, resulted in the farm home not being the attractive and convenient place to live that it might be. If the boys and girls of the rural communities are to appreciate the life in the country so that they will be willing to take up their life work on the farm, it will be necessary to improve the average farm considerably.

It is impossible to plan a farmstead and buildings that will be suitable for all farms, but satisfaction and economy may be secured if careful thought is given to the arrangement and plans of the buildings on each farm. There are many conveniences that may be easily installed later if a little planning is done before the buildings are located and erected and which it is almost impossible to secure if proper arrangements are not made when the buildings are under construction.

A study of the essentials of a good farmstead arrangement shows that there are at least ten points to be considered. They are:

1. Ease of access to the field and pastures and yet near enough to public road to not be isolated; usually this locates the farmstead near the middle of one side of the farm.

2. Good drainage around the buildings. This must be so that the water from melting snow, etc., will not collect and make the yards and roads almost impassable.

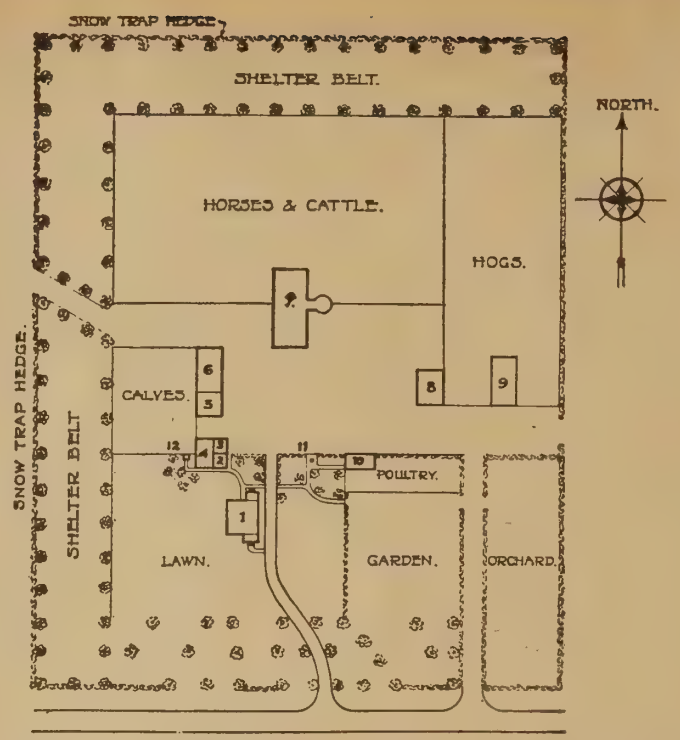
3. The size should be suited to the size of the farm and should take into consideration the kind of farming and the future development of the business.

4. Convenient arrangement of the building so that the work of feeding stock, etc., can be carried on without extra travel.

5. Proper distance of other buildings from the house so that odors, flies, and noises will not be objectionable and danger from fire serious, and yet not so distant that unnecessary time will be consumed.

6. Proper distance of buildings from road so as to avoid dust and danger from passing automobiles.

7. Proper location of trees, shrubs, garden, etc. The trees for windbreak should be in the direction of the prevailing winds in winter; in Minnesota, this is north and west. The shrubs should be located so as to improve the appearance. The garden should be near enough for the vegetables to be cared for and gathered without unnecessary travel.



8. Convenient driveways add much to the satisfaction derived from a well laid out farmstead.

9. Attractiveness of view from house. It is well to consider this point carefully when locating windbreaks, shrubs, etc., as it adds much to have the view toward the road, village, and lake left clear to be enjoyed. It is important that the view from the kitchen windows be carefully considered, as much time is spent in the kitchen of a farmhouse.

10. The attractive appearance from the public road has much to do with the value and satisfaction derived from a farmstead. The house should have the most carefully selected site and the barns and other buildings should be in the background.

Sketches and drawings help in the planning of a farmstead. A good method is to stake out on the ground the location of buildings and drives and then make a plan for future study and reference.

In order to help the farmer in his study of farmsteads, the University of Minnesota, through the Division of Agricultural Engineering, has prepared several plans of farmsteads along with farm building plans. The plans shown are typical of the farmsteads. A list of these may be secured by addressing the Division of Agricultural Engineering, University Farm, St. Paul, Minnesota.

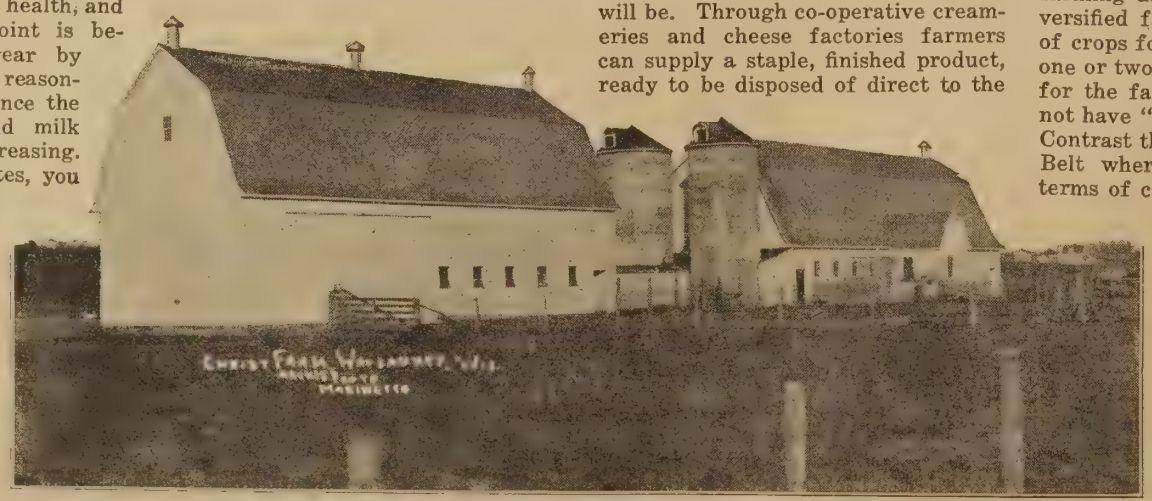
This farmstead, facing south, shows the house about 150 feet from the road and the other buildings and grove arranged as a background thus making the house the most important feature in the farm building group.
1, represents house; 2, washroom; 3, milk house; 4, ice house; 5, shop and garage; 6, machine shed; 7, barn; 8, granary and corn crib; 9, hog house; 10, poultry house; 11, well; 12, outhouse.

Dairy Farming, The Most Permanent Industry

Seven Reasons Which Prove the Truth of This Assertion

J. H. ALEXANDER, WISCONSIN

AS a secure and permanent occupation, none of the common forms of farming compare with dairying. Still, many dairymen have regarded the future of the industry with doubt. Falling prices during the past few months have led them to wonder and worry regarding their heavy investments in live stock, land, buildings, and machinery. Let them consider the following seven reasons why dairying is the most permanent form of farming. We could give more, and will gladly do so if called upon, but seven always was a lucky number with us. Besides, we rest assured that seven reasons will more than remove the last vestige of doubt from the mind of any farm reader.



First—Milk and milk products are absolutely essential to life, health, and normal growth. This point is becoming better known year by year to our reading and reasoning public; as a consequence the consumption of milk and milk products is steadily increasing. So is the use of substitutes, you may say, and you would be right. War prices and highly commendable patriotism popularized the use of substitutes. But none of the so-called substitutes, no matter how extensively advertised, dare meet pure milk products in open battle. Why? Because milk products contain vitamines, and vitamines are absolutely essential to normal health and growth. They are not found in appreciable quantity in other animal oils and in vegetable oils, and it is these oils that form the base of all substitutes on the market.

Second—During the past five years our population has increased seven per cent; milk consumption has increased ten per cent in the same period. What do these indisputable facts promise for the future? The population of the United States is increasing rapidly and history will show that it has been on the steady increase for the past century. Immigration and the natural increase through births assure further growth. Education in child welfare and general health insists on milk for the growing child. Therefore we may expect to see milk consumption increase far more rapidly and markedly in the next generation than in the decade just ended. What could be a more promising guarantee for the future than an ever increasing and expanding market.

Third—Dairy products are a source of regular and reliable profit. The market for dairy products has never been controlled by a few; it never will be. Through co-operative creameries and cheese factories farmers can supply a staple, finished product, ready to be disposed of direct to the ultimate consumer if necessary. This in a sense makes possible the elimination of the middleman, and has been used by farmers where it was found that the "split" in profits was going against them. Once a month, twice a month, or even every week or day in some cases, the dairyman receives payment for the work his cows have done for him—and cows don't work on an eight-hour day basis either. Thus the dairy farmer is enabled to pay cash for things he buys and is free to "stand from under" when hard times threaten. The fact that rural Wisconsin is better situated financially right now than any of the Corn Belt states proves the truth of this point.

Fourth—Dairying and diversified farming are one and the same. Diversified farming produces a variety of crops for market; a failure of any one or two does not mean bankruptcy for the farmer. The dairyman does not have "all his eggs in one basket". Contrast this condition with the Corn Belt where wealth is measured in terms of corn, hogs, and steers. This year has seen the "bottom drop out" of the market for the three things he produces — commodities he has always considered as legal tender. As a consequence there is no money in circulation, farmers are not able to meet their obligations, farm sales made a year ago at

at a lower degree of heat than those of high lead content.

Soldering Fluxes

Before two surfaces are soldered they should be scraped and cleaned. Then some soldering flux should be applied and the process completed.

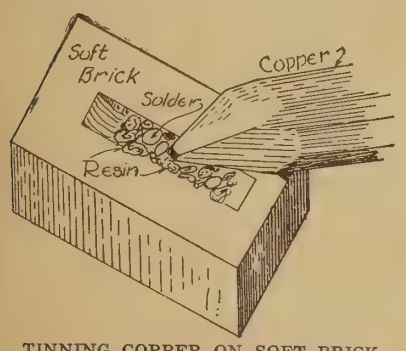
As borax and resin are the most commonly used fluxes for soldering, they may be used in dry or liquid form. The liquid is most convenient, especially for outdoor work where the wind will blow the dry powder.

Resin may be dissolved in wood alcohol and applied with a stick, brush, or feather. As the alcohol will evaporate easily, the solution should be kept stoppered up when not in use.

Borax may be had at most any drug store. It will dissolve in water and may be applied to the object to be soldered the same as the resin solution. When the hot soldering copper is passed over such a flux in solution, the liquid vaporizes and leaves the flux adhering to the material to be soldered.

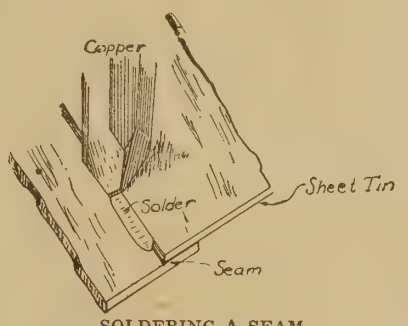
There are many soldering compounds on the market in the liquid and paste form which are satisfactory.

Use of Soldering Copper



When the object to be soldered is cleaned and the flux applied and the copper heated and tinned, the next step is to take solder with the copper. It is impossible to "scoop" up the solder with the copper. Press the hot copper on the end of the stick of solder and a small drop will be melted and stick to the copper when it is removed. If the solder does not stick to the copper it is not tinned properly. This is the secret to a good job of soldering. It is impossible to make solder stick to a poorly tinned copper by pressing it on the stick of solder. This will melt large quantities of the solder and result in waste.

When two pieces of metal are to be soldered together lay one piece on the other after they have been cleaned, apply the flux and hold the surfaces together with a file or screw and run the seam. The copper should be carried along as fast as the solder will flow.



Soldering Coppers

When one has to solder a pin hole in a tin pan, he wants a different kind of soldering copper than when he wants to run a seam on the barn roof. A small copper is the thing for fixing up the milk pails and such jobs. In fact, one can easily make a small soldering copper with a piece of copper wire. Just file one end to the shape and bend the other end in the shape of a ring for a handle.

Always keep the soldering copper in the right shape. If it begins to become round at the point, it becomes next to worthless. A round point soldering iron may be put in shape by the average blacksmith. Heat the copper to a bright red and hammer all four sides equally, and the point will come right. Probably the end of the copper may be squared off with a file.

TINNING COPPER ON SOFT BRICK

SOLDERING A SEAM

Exodus of Scrub Bulls From Missouri

Ninety scrub bulls in Missouri have been replaced by well bred registered animals as a result of the first three months' efforts in the "Two Thousand Dollar Better Bull Contest". This report is incomplete since it includes only 20 counties while there are 44 counties in the contest. This contest is conducted jointly by the Extension Service of the College of Agriculture and the Agricultural Department of the Kansas City Chamber of Commerce. Four prizes, $1,000 first prize, $500 second prize, $300 third prize, $200 fourth prize, are offered by the Chamber to the counties replacing the greater number of scrub bulls with pure-bred bulls.

Grundy County leads with 15 scrubs replaced. County Agent W. H. Kern writes that this is not all because he has been unable to get reports from some sections of the county. County Agent W. W. Merritt reports Ralls County second with 12 less scrubs. Johnson County is third with 8 replacements and the county agent, R. S. Clough, reports two bull sales arranged for in the near future. Gentry County has replaced 7 scrubs according to L. A. Saunders, county agent.

The rules of this contest define a scrub bull as one that is not registered or eligible to registry and he is replaced when castrated or sold out of the county, and an interest in the registered bull purchased. With this provision it is safe to assume that these 90 scrubs either hang in the coolers of the packing plants or they are traveling in that direction.

April and May will be hard months for the Missouri scrubs. Pettis County will sell 50 registered bulls of different breeds at auction May 11. Nodaway County has six sales arranged with 15 to 20 pure-bred bulls for each sale. Knox, Johnson, and other counties have one or more sales advertised. The sale of well bred bulls to his neighbors is one of the best advertisements a breeder can have. Breeders realize this and are offering good individuals for these sales expecting them to sell for very moderate figures. In many letters received by the Kansas City Chamber of Commerce, bankers signify their willingness to extend credit for the purchase of pure-bred bulls.

Managers of live stock shipping associations are co-operating with the county agents in locating and disposing of scrubs. Professor E. A. Trowbridge, chairman of the Better Bulls Committee which has charge of the contest, says that interest and competition between counties is becoming keen and that he hopes this contest will be the beginning of a series of such efforts to improve Missouri live stock.

Missouri. GEO. W. CATTS.

Bigger Production For Bigger Profits

More acres, more bushels raised at less cost, will determine farm profits this year. Twin City Tractor power will help you get them.

The speed, dependability and economy of a Twin City 12-20 Tractor enable you to use it on every farm job and to make the quickest time.

The Twin City 16 valve-in-head engine made the record of 45¾ cents per acre in 1920 plowing contests.

See your nearest Twin City dealer. Get the facts about Twin City organization for service in every section. The full Twin City line includes Tractors, All-Steel Threshers and Trucks. Write for catalog.

EDITORIAL COMMENT

GOVERNOR Hartness of Vermont has suggested that the Commissioner of Agriculture, E. S. Brigham, may soon be a plumber, regulating the flow of synthetic milk as it is piped from place to place. This may occur if scientists become successful in the manufacture of such milk. On the other hand, we rather believe the expense of piping milk from place to place can be saved as we expect each family will have an outfit to brew its own milk. All that is necessary it to take a little hay, silage, grain, and perhaps some of the wastes from the kitchen and put it into a kettle, stew it, then open the faucet, and draw out the milk. This would simplify our present system of milk supply and save Mr. Brigham from becoming a plumber.

SILOS ON CREDIT

Securing credit to finance farmers is receiving a good deal of attention these days by Congress and the various state legislatures. This is as it should be, but what is needed is needed now and cannot wait entirely on slow moving governmental machinery.

It is refreshing to notice that some communities are meeting the need of credit in part at least, and the latest of these to come to our attention is the plan of the Farmers' Livestock Credit Company of Marinette County, Wisconsin. This concern was primarily organized to supply farmers of that county with money for the purchase of good cows, the money to be repaid in equal monthly installments extending over a period of three years. This concern has more recently offered to loan money on like terms to farmers in its territory for the purchase of silos, the slogan being: "Good cows will pay for themselves, and a silo well filled will give them a chance to prove it".

This new plan of putting silos in the reach of farmers on an easy payment plan provides that any farmer of Marinette County who has five or more good milk cows can buy any good silo he desires and the company will loan him the money upon his giving a chattel mortgage on his live stock. This loan is payable in equal monthly installments extending over a period of three years, with interest at six per cent. It is a case of "let the silo pay for itself".

MUNICIPAL MILK PLANTS

A bill has been introduced in the Assembly of the Wisconsin Legislature which, if enacted into a law, grants a city the privilege of owning and operating its own milk plant.

Those favoring this bill hold that milk should be considered a public utility because it is such an important food product. For a city to get into the milk business the bill requires 10% of the qualified electors of the city to sign a petition. The petition is presented to the city council and, if adopted by this body, the mayor is required to appoint a commission of nine from the names that appear on the petition, and it will become the duty of this commission to make the necessary arrangements for the city to handle and distribute the milk supply.

We are opposed to such legislation. It is uneconomical and non-essential to securing a wholesome supply of milk for the people. We do not believe that cities should go into business and there is no more reason for the city going into the milk business than into the business of selling sugar, flour, etc. Those who favor this bill can not point out where any saving could be made by a city handling the milk business.

The most ridiculous thing about the bill is that 10% of the people can determine what the other 90% shall do. In our governmental affairs we believe the majority must rule but we would demand more than a majority to decide whether a city or a state is to enter business. The very fact that the bill provides for but 10% of the people to decide what the other 90% shall do, shows how unfair and inconsiderate are the persons responsible for this bill. They do not consider the rights of 90% of the people. If there is a group of persons in any city which desires to handle the milk business it can do so upon a co-operative basis, for our laws will permit them to organize a co-operative milk plant. But for 10% of the people to vote the other 90% stockholders in a business enterprise is so unreasonable and unjust as to be unthinkable. It is un-American, un-democratic, and it is adopting the rule of the few for the many. It is autocracy.

FILLED MILK INCREASES

While condensed and evaporated whole milk declined in 1920 over fifty per cent from the high record of 1919, the imitation, cocoanut product, filled milk, increased twenty-four per cent. Consumers paid nearly the same price for this imitation product that they would have paid for the genuine article and the market for the honest product was depressed by over 85 million pounds.

We have here represented the "great value" of filled milk to the dairy farmer. This hard headed individual took the glowing advertisements as buncombe, and he can now sit down and figure. This product found a market for nearly seven million pounds of fat from foreign lands at the expense of a like amount of butterfat from cows milked twice a day by the American dairyman. Not only this, but it was also the means of placing some eight million pounds of butter on the market to compete with the regular creamery supply.

Despite this injury to his business, the dairy farmer is told that this wonderful filled milk is a great aid to him because it finds a market for skimmilk. Even here, however, the argument walks on one leg. In the manufacture of filled milk the whole milk is separated and the cream churned into butter. The skimmilk and the buttermilk are then evaporated and the cocoanut oil added. Very little, if any, skimmilk is used other than would have been used had the milk originally been made into the honest product from which the consumer would get real value.

Filled milk must go, both in the interest of the consumer and the producer. It is injurious to both. Has your legislature acted on this yet? Ohio is already safe, Pennsylvania and New Jersey are on the way to safety, and New York and Wisconsin will soon act.

CLEAN HERDS FOR EXHIBITION

The American Jersey Cattle Club has expressed itself in a resolution that no cattle should be exhibited at the National Dairy Show beginning with the year 1924 unless they come from accredited herds. The Club also contemplates offering no premiums to fairs, cattle expositions, etc., unless the managements of these institutions require all cattle exhibited to come from accredited herds.

We approve most heartily of the position taken by the American Jersey Cattle Club and urge all breed associations to take the same action. It is very essential, if tuberculosis is to be eliminated, that no cattle be exhibited unless they are free from tuberculosis. The rules of many fairs and of dairy shows require cattle to be accompanied by a tuberculin test certificate before they are permitted to enter for exhibition purposes. It is commonly reported that some fairs have not rigidly enforced this rule which we consider very unfortunate for the herds exhibited.

It is to be regretted that the showing of cattle has been one of the methods of spreading tuberculosis. No one with a clean herd of cattle can afford to exhibit any of its members unless it is positively known that the managements of fairs and dairy shows require a tuberculin test certificate to accompany every animal exhibited. Tuberculosis is an insidious disease and when it once gains entrance to a herd it requires vigilance and extreme care to eliminate it. Since the advent of the accredited herd list and the large number of breeders having their herds accredited, it will work no hardship upon the various cattle expositions to require all cattle shown to come from accredited herds. We have arrived at a time, we believe, when the very life of any cattle exhibit depends upon how well these rules are enforced. Too many of the herds that were on the show circuit last year are suffering from having several of their members react to the tuberculin test. To require exhibition cattle to be free from tuberculosis is only safe and sane.

JOHN BURROUGHS

In the death of John Burroughs we are reminded of the large opportunities for gaining happiness and living a life of large enjoyment. Mr. Burroughs did not make any substantial contributions to improve methods of farming or advocate any principles of economics which would improve the income of the farmer, but by his life he taught a most wholesome lesson for every person living upon the farm.

He made companions of the birds. The trees and rocks became his friends. He studied nature in every department and so adjusted himself to her ways that he reveled in her beauty and understood her purpose. It is a wonderful accomplishment to be able to understand the language of the birds, the habits of the bees, the home of the squirrels, the meaning of the rocks, and the beauty of the flowers. When all these things are understood they bring a constant source of pleasure and make life supremely interesting and enjoyable. We must of course pay attention to the things which bring us our daily bread but at times we feel that if we were to emphasize the earning of money less and devote more time to learning of nature we would be a better people and develop a greater nation.

John Burroughs wrote many books which reveal the wonderful understanding he had of nature and her purpose. One of his volumes is devoted to weeds and by associating them with folks he gives a person an entirely different attitude toward them. He makes them human for they are not found except in civilization. To show just a bit of his conception of nature we quote a paragraph from one of his many books:

"I have loved to feel the grass under my feet and the running streams by my side. The hum of the wind in the treetops has always been music to me, and the face of the fields has often comforted me, more than the faces of men. I am in love with this world because by my constitution I have nestled lovingly in it. It has been home. I have tilled its soil, I have gathered its harvests. I have waited upon its seasons and always have I reaped what I have sown. While I delved I did not lose sight of the sky overhead. While I gathered bread and meat for my body I did not neglect to gather its bread and meat for my soul."

The farmer is constantly surrounded by the things that gave Mr. Burroughs such a delightful life, and would find his work less arduous and the world a brighter place in which to live if he would take time to observe and understand them.

STOVER SILAGE FOR MILK COWS

Recent widely diverse statements concerning the feeding value of corn stover silage has led the University of Wisconsin to make some experimental tests with this feed. The University says, "In certain advertisements of husking and silo making machinery the surprising and obviously unwarranted claim has been made that corn stover silage is equal in feeding value, ton for ton, to normal corn silage from which the ears have not been removed."

A feeding trial has been carried on in which two lots of cows were fed either corn silage or corn stover silage along with alfalfa hay and a concentrate mixture made up of ground corn, wheat bran, linseed meal, and cottonseed meal. The cows were fed all of the silage they would clean up and the amount of the other feeds was kept equal for the two lots. It was found that the corn stover

silage was eaten quite readily, but that five pounds a day less was consumed than of normal corn silage, indicating that the corn stover silage was somewhat less palatable.

The moisture content of the corn stover silage was 73%, which is about that of normal corn silage. When corn stover silage was fed, the cows gave an average yield of 24.5 lbs. of milk daily containing .97 lb. of fat. On normal corn silage they produced 27.4 lbs. of milk containing 1.05 lbs. of fat; that is, they yielded 11.8% more milk and 7.1% more fat than with corn stover silage. When the smaller production with corn stover silage is considered it is calculated that this silage is worth about 61% as much per ton as normal corn silage as shown in these feeding trials.

Clover With Soy Beans

Would it be desirable to seed clover seed with soy beans or with sudan grass? When the nurse crop is cut, should a long stubble be left? Some of my seeding failed. Which would be the most profitable for this year, soy beans, sudan grass, or serradella on heavy soil?

Sparta, Wis. A. P.

The one objection to sowing clover seed with soy beans is that the soys are not planted until the latter part of May and there is some danger that the small clover plants will be injured by the hot summer weather. It would seem preferable, if hay is desired, to sow a bushel and one-half each per acre of field peas and oats, seeding with this the usual amount of clover seed. The oats and peas will come off the ground early in the summer and will then give the clover a chance to recuperate and make a fairly good growth, providing the season is at all favorable.

We have had no experience with growing clover, either with soy beans or peas and oats. We have had, however, personal experience in seeding alfalfa with canning peas. The canning peas are cut very close to the ground and we thought, the first season, it would absolutely destroy the alfalfa. We have followed this practice for three years and we have not yet failed to secure an excellent stand of alfalfa by this method. We anticipate the same rule would hold in cutting oats and peas for hay, although it might be some additional precaution to leave a moderately good stubble. To cut as grain is cut would represent considerable loss in the first hay crop and we question whether the results would justify this procedure.

We would scarcely advise sudan grass or serradella for this section of Wisconsin, although these will make excellent growth. As previously stated, we believe the oats and peas the better crop. However, it might be desirable to try out a small seeding of these other crops and then note the results.

Human and Bovine Tuberculosis—Acidity Tests

A country physician in southern Wisconsin claims there is no danger of any person contracting bovine tuberculosis from the use of milk from tuberculous cows, except in the case of a very weak, puny infant. We claim he is not an authority on that subject. Kindly give us the results of experiments conducted along those lines by persons who are in a position to know.

How many acid tests are there for milk? Please define the best one and give formula for calculating the percentage. How do we obtain this formula?

Wisconsin. F. L.

There are distinct differences between the human and bovine types of tubercle bacteria. It is now generally believed that adults seldom become infected with the bovine variety of tuberculosis, but children seem to be particularly susceptible to this.

In a special investigation made in New York where 389 cases of human tuberculosis were studied bacteriologically, it was found that only 8 of the 175 who were 16 years of age or older were infected with the bovine type. Of the 78 tubercular children between the ages of 5 and 16, 24 were infected with the bovine variety, while of the 136 tubercular children under 5 years of age, 37 were infected with the bovine type. Dr. Park states that from 200 to 300 children die in New York City annually with tuberculosis of the bovine variety. This is a heavy toll to pay for infected milk from a disease that can be prevented by care either in securing milk only from tuberculosis-free herds or by the use of properly pasteurized milk.

There are several different methods of testing the acidity of milk and a detailed explanation of which it is impractical for us to give. "Testing Milk and Its Products", by Farrington and Woll, has a very complete discussion of these several different tests.

There has recently been considerable discussion as to whether the acidity test is a proper test to determine the desirability of milk for condensing purposes. Professor Hart of the Wisconsin College of Agriculture states that experimental work with the University herd has shown that according to this test the milk of many normal cows would be rejected, for these cows will frequently show tests of over .18 per cent acidity. He holds that the only accurate test is one which is really usable only in the laboratory and that the availability of milk for condensing cannot be accurately determined by the so-called acidity tests. However, these tests do indicate, to a certain degree, milk which is not of the right character for condensing and the test also has a place both in the creamery and cheese factory.

Contents of Silo—Value of Silage

Please give me the amount of silage in the bottom 8½ feet of a silo 14 ft. in diameter? The silo was filled last October to a depth of 36 feet deep. Corn in the field at that time averaged about 50 bus. per acre, and is now worth about 45c per bu. What would silage be worth per ton now?

Traer, Iowa. C. S.

If the 14-foot silo was filled to a settled depth of 36 feet, the bottom 8½ feet would now contain approximately 28½ tons. If the settled depth did not exceed 30 feet, then the 8½ feet left would contain slightly less than 27 tons.

The most convenient and usual way of valuing silage is to compare it with the price of timothy or other hay that is common in the vicinity. In this method of computation, it is assumed that one ton of hay in the stack is equal in value to three tons of silage in the silo. In other words, if hay is worth $15 a ton in the stack, the silage would be valued at $5 per ton in the silo. Owing to the fact that silage is more palatable than hay, it is often assumed that it does not make more than 2½ tons of silage to equal one ton of timothy hay.

Another method of computation, that has been used to some extent, is to base the value of silage on the price of corn per bushel. In a ton of corn silage there are approximately 5 bushels of corn. With corn at 45c per bushel, this would make the silage worth $2.25 per ton. However, to arrive at a more nearly correct price, take the price of corn in the local market, as it is assumed in this estimate that the cost of ensiling and storing corn just about offsets the expense of harvesting, husking, and delivering corn to the local market, with some slight allowance for the value of cornstalks as feed.

At the present time, it is more than reasonable to suppose that silage is worth somewhat more per ton than this method of valuation gives, owing to the fact that it supplies a certain portion of the dairy cow's ration that cannot be supplied adequately by either corn or corn stover. With the present prices of dairy products, we would expect cows to return a very good profit on corn silage at $4 to $5 per ton.

Seeding Alfalfa in Corn

I have about six acres of meadow sod land that I want to put in corn this spring, and some time in August I want to sow this land in alfalfa. Would it be a good plan to go through the rows with a 5-shovel, one-horse cultivator to loosen up the soil, then sow about 10 lbs. inoculated Grimm alfalfa seed per acre? I would like to do this in August as the corn will not be ripe to cut up in shocks by this time. Kindly advise me if this would be a good way to sow, or cut up to shock corn first, or sow in spring.

Festus, Mo. E. J.

A few months ago one of our Wisconsin readers gave us the following information concerning his method of seeding alfalfa in corn. He says: "We have seeded alfalfa for the third time in our corn. We do not recommend this as the best method, but we cannot seed in grain nor can we afford to miss a crop. The corn should be well worked early and kept clean. Cultivate the last time with a harrow-tooth cultivator and seed with a wheelbarrow seeder. Do not stir the ground after sowing or some seed will be covered too deep. The corn is cut off for silage and the corn stubbs are harrowed down when the ground is frozen."

This gives the usual system of seeding alfalfa in corn and some men have reported very excellent results. Unless a special form of drill is used, there may be some difficulty in properly distributing the seed, especially if the last cultivation comes when the corn has reached a fairly good growth. If this corn is to be cut and shocked, care must be exercised to get the corn shocks off the field with very little delay, otherwise they will kill out the growing alfalfa. The better system is to seed alfalfa in corn which is to be used for silage.

Another method of seeding alfalfa in corn is discussed on page 1114 of our issue for January 14.

Udder Trouble and the Milking Machine

Three Men Give Their Experiences

In a recent issue I read Mr. Larsen's reply to an inquiry on inflamed udders resulting from use of a milking machine. Mr. C. Larsen says this condition cannot directly be blamed on the machine. However, I have had the same experience as Mr. F. M. B. If the machine is handled at all carelessly, inflamed quarters will result.

Mr. Larsen may have handled the machine with extreme care and thereby avoided this condition, but I have seen several cases where inflamed quarters were caused by the milking machine, especially is this true of the machine receiving strong suction and it is mostly always caused by leaving the machine on too long. If the operator will massage each cow's udder long enough so that the cow lets down her milk before applying the machine and watches closely when the flow stops, removing the machine at once, he will have no trouble with inflamed udders. Too many dairymen think that a machine ought to work well even if not looked after, but it won't; and the way some men operate their machines with leaky hose, etc., it is no wonder that they have cause for cursing the machine. A careless man is always better off to leave the milking machine alone in the first place.

Colorado. WALTER ANDERSON.

I note some are having udder trouble with milking machines. I have had less trouble with udders since using milker than I had before. I do not attempt to use but two units and try to get to each cow before she quits milking and massage the udder. I believe Nature intended that such should be done or the calf would not do so much punching.

Iowa. F. M. EDGERTON.

I have used a milker for over four years on a herd of Guernseys and had charge of the same herd for six years previously with hand milking. In over four years of machine milking we have had only one bad case of infected udder, while under hand milking I never went six months without a case.

I have had symptoms of infection at times, but a gentle massage while milking with the machine has drawn the infection out before the milk showed any signs of clots. The infection has never spread, as I have never had two cases at near the same time since milking by machine. I have had some cases of cowpox but have milked them with the machine and never had them spread to other cows. The cause of the infection not spreading I take to be the use of the chloride of lime and salt solution in which the teat cups were kept.

I have found the use of the milker with a gentle massage the best remedy for caked udder. In several cases I have had teats stepped on and badly crushed, and on at least two occasions have saved the udder and cow when I know from past experience that it would have been exceedingly difficult, if not impossible, to have done it by hand. The milker causes intense pain when first applied but when the teat cups are once seated the cows do not even act uneasy. In my experience with milkers, do not find any drawbacks to their use whatever when they are given reasonable care.

New York. EMERY M. GROUT.

Oil Meal for Calves

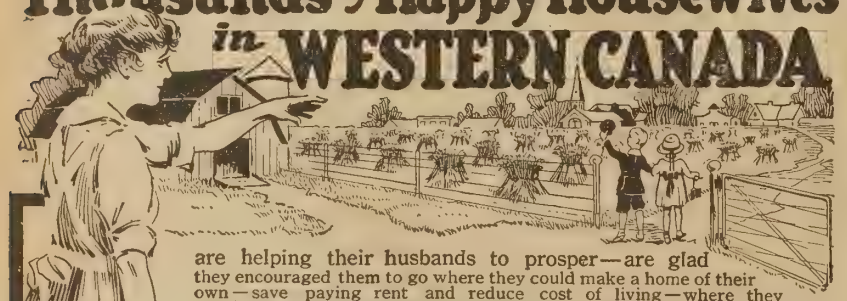
Please let me know if it is harmful to feed calves all the oil meal they will eat.

Frederic, Wis. J. B.

It is safe to let young calves have all the oil meal they care to consume, provided it is given to them as soon as they begin to consume feed. If this is done they will accustom themselves to eating considerable quantity without injury. To permit a calf several months old to eat all the oil meal it may care for will cause scours. This would produce bad if not fatal results.

We saw a group of calves at the Michigan Experiment Station being fed all the grain of various kinds they cared to consume and they were apparently in the best condition; but this system of feeding was begun when the calves were but two or three weeks old.

Lowe Brothers



There Is A Gold Mine In Your Garret

Unless your garret is different from most folks, it has a lot of old discarded furniture in it, too shabby to use. Furniture, such that love nor money couldn't buy today. It's altogether too good to have up there. Bring it down and restore its youth with Vernicol Varnish stain. Whether it's mahogany, oak or walnut, matters not, there is a Vernicol finish for each. No trick to use it. Goes on with a brush just as easy as spreading butter on hot toast. It sure does make things do by doing them over. Sold by the best dealer in each town. Send to this address for Vernicol Circular.

THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill

A year's supply of oil is sent with every Aermotor

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

Association Notes

Wausau—Marathon, Wisconsin:—One pure-bred Holstein bull was purchased and two cows were sold for dairy purposes in order to make room for better producers. The average production of the cows for this year is lower than the previous year, due chiefly to neglecting to feed last fall when feed prices were rather high and pasture very poor. Market milk testing 4 per cent sold for $2.20 per cwt. The creamery paid 45—52c per pound for fat and the cheese factory 50—56c per pound. Milk retails for 8 to 12c per quart; butter 48c per pound and cheese, 32c. Prices for feed are: Hay, $20 per ton; silage, $6; bran, $30; middlings, $30; corn, $30; corn meal, $34; oil meal, $48; Wisconsin balanced ration, $43; beet pulp, $36; hominy, $33; oats, 48c per bushel; barley, 75c.

Unity, Wisconsin:—One member raised his daily milk production over 100 lbs. in less than a week by changing his ration to conform to the tester's suggestion. Two herds in this association are doing A. R. O. work. One pure-bred Guernsey was purchased to replace a grade sire. Milk testing 3.5 per cent sold for $2.25 per cwt. Milk retails for 10c per quart; butter, 49c a pound; and cheese, 21½c. Feed sold for: Ground oats, $29 per ton; ground barley, $30; ground corn, $28; wheat bran, $28; oil meal, $44—$46; cottonseed meal, $45—$55; gluten, $48—$54; wheat middlings, $30—$33.

Fort Atkinson, Wisconsin:—During March the condensery paid $2.25 per cwt. for 3.5 per cent milk and 5c per point above. The creamery paid 50.5—53c per pound for fat. Feed prices: silage, $6 per ton; alfalfa, $24; timothy, $22; clover, $20; corn meal, $30; corn, $23; brewers grains, $42; bran, $24—$30; oil meal, $46; cottonseed meal, $42; hominy, $30; oats, 50c per bushel.

Wood County No. 2, Wisconsin:—Three cows were sold during March on the basis of their association test. Five members have been admitted which makes a total of 43. The condensery paid 57½c per pound for fat, and the cheese factory 56—63c. Corn sold for $25 per ton; middlings, $30; bran, $29; oats $30; oil meal, $45; clover, $18.

Amherst—Nelsonville, Wisconsin:—A consignment sale of Guernseys will be held at Amherst, May 25 and 26th. Six cows were sold for beef and four for dairy purposes. Four herds have been tuberculin tested. Balanced rations are being fed in this association. Oats sold for $28 per ton; bran, $26; oil meal, $43; Unicorn, $50.

McHenry Co., Illinois:—This association is being supervised by the County Farm Bureau and Soil Improvement Association. There is a Farmers' Co-operative Mill at McHenry. Nearly all members feed balanced rations and use pure-bred sires. The standard of production is being raised by co-operating with the Soil Improvement Association. During March 3.5 per cent milk sold for $2.35 per cwt. and 4c for each point above. Feed prices: Alfalfa, $28 per ton; clover, $24; timothy, $25; silage, $6; corn, $28; oats, $40; cottonseed meal, $48; oil meal, $50; bran, $33; barley, $36; brewers grains, $35.

Rutherford County, Tennessee:—Rutherford County is forging ahead in R. of M. testing. This month, 70 per cent of all cows tested are on R. of M. tests. Twenty-nine per cent of all cows tested made more than 40 lbs. of fat. This association wishes to know if there is any other county in the United States that can duplicate the two above facts. Corn still continues to sell locally for $4.00 per barrel, while it is quoted much cheaper.

Luck—Milltown, Wisconsin:—Five cows were sold for beef. One hundred per cent of the members are feeding balanced rations in this association. Official work in testing is having good effects. Two seven-day tests have been finished during the past month, with the result that there are two 21-lb. cows which were fed under ordinary conditions. Oil meal sold for $41 per ton; wheat middlings, $26; oats, $24; corn, $26.

Hillsdale County, Michigan:—During March, 3.5 per cent milk sold for $2.10 per cwt. Feed sold as follows: Alfalfa hay, $10—$12 per ton; mixed hay, $8; oats, $25; bran, $40; corn, $25; cottonseed meal, $45; oil meal, $45.

Oldham, Kentucky:—Practically every dairyman in the association has been feeding balanced rations this winter. The rations consist mainly of crushed corn, ground oats, bran, and cottonseed meal. Very satisfactory results have been obtained when these balanced rations have been fed in the proper amounts. During March market milk, testing 4 per cent, sold for 20c per gallon. The creamery paid 46—53c per pound for fat. Milk retails for 11c per quart; butter for 50c per pound. Bran costs $34 per ton; hominy, $32—$34; oats, $40; cottonseed meal, $36; oil meal, $52—$56; corn, 65c to 70c per bushel.

Knox County, Illinois:—Fifty-three cows produced over 1,000 lbs. of milk. More than 40 per cent of the cows in

this association are pure-bred. All members are using pure-bred bulls. Nine members are using milking machines and two more are planning on purchasing machines soon. Fifty per cent of the cattle in this association have been tested for tuberculosis. Two members have purchased a well bred bull co-operatively. All members are feeding balanced rations made up of home-grown feeds with the addition of a little cottonseed or oil meal. As a side line to testing, the tester of this association has been weighing babies at the various farms and recording the weights from time to time in the herd book. There is as much competition among the women about the gains the babies make from time to time as there is among the dairymen for high cows. During March 3.5 per cent milk sold for $2.43 per cwt. and 6c paid for each point above. The condensery paid 44c per pound for fat, and the creamery paid 46c. Milk retails for 15c per quart and butter for 45c per pound. Feed sold as follows: wheat bran, $34 per ton; molasses feed, $37.50; cow chow, $39; cottonseed meal, $42; oil meal, $50; alfalfa hay, $22.50; clover hay, $18; corn silage, $5.00.

McGregor, Iowa:—The members of this association are seeing the benefits to be derived from the cow testing association. Especially this spring, they see that by feeding cottonseed meal and oil meal their cows will not decrease in milk flow. One statement was made by one of the members which lets us know what he thinks of the cow testing association: "I believe the cow tester saves me enough money on my feed bills in one month to pay his wages for one year." Oil meal sold for $50 per ton; cottonseed meal, $38; bran, $26.50; clover hay, $18; timothy hay, $20; alfalfa, $23; oats, 30c per bushel; corn, 60c.

Minnesota Test Records

Professor M. H. Fohrman, superintendent of official testing in Minnesota, says that February was the biggest and best testing month his department has yet known. Both the long and short time divisions established new figures for quality. "By the end of March," says Professor Fohrman, "we will have done more testing in the nine months of the present fiscal year than was done in the entire fiscal year before."

Forty-seven supervisors were kept busy in February with 970 tests, as follows: 735 one and two-day tests; 209 seven-day tests; 8 30-day tests; 2 60-day tests; 7 retests; 9 verification tests.

The yearly tests were divided among 100 herds of the various breeds as follows:

Breed	No. tests
Holstein	515
Guernsey	149
Jersey	49
Shorthorn	13
Red Polled	4
Brown Swiss	1
Ayrshire	1
Total	735

There were 148 cows, from 58 herds, on the honor roll for February as against 100 cows on the roll in January. To get on the honor roll a cow must produce four pounds or more of butterfat in two days, or at the rate of at least 60 lbs of butterfat for the month.

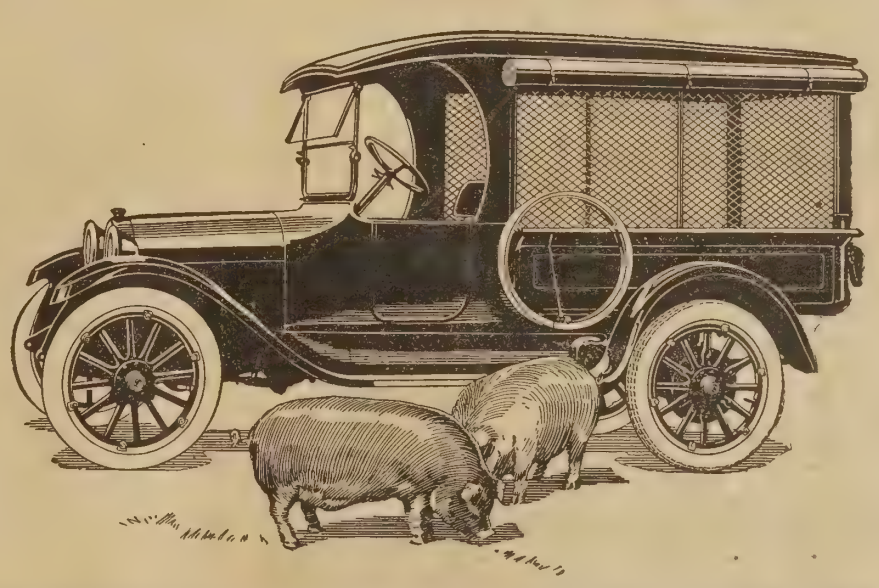
In his monthly news letter for Februray, L. V. Wilson, University Farm, state agent in dairying, says that February was also a big month for Minnesota cow testing associations. A cow owned by Marlow & Randall of the Blue Earth County Association produced 97.33 lbs. of butterfat during the month. Two hundred ten cows were tested in this association and 75 produced more than 40 lbs of butterfat each. A cow owned by P. A. Lyngen of the Chippewa County Association produced 99.9 lbs. of butterfat during the month. Another good producer was from the herd of E. J. St. Martin of the Hennepin County Association, her record being 85.2 lbs. of butterfat for the month.

Forty-one cows in the Pope County Association produced 40 or more pounds each of butterfat during February. Pope County association members have recently purchased four pure-bred bulls and six registered heifers. One member paid $400 for a yearling Guernsey bull.

The records of the Northfield Association were exceptionally good for the month. Sixty-one cows produced more than 1,200 lbs. each of milk or 40 lbs. of butterfat.—Minnesota College of Agriculture.

Wisconsin Associations

In seventy-five cow testing associations in Wisconsin, from which reports were received in February, the Holstein cow, Epa Debores in the Wood County Association, was the leader. In the 28 days of February she produced 115.5 lbs. of fat. Eighteen other cows produced 80 lbs. fat or more during the month. Of the 75 highest producers 48 were Holsteins and 20 were Guernseys. The Byron Association leads in the number of 40-lb. cows for the month, having 130 in 20 herds. In the Horicon Association, which was second, 123 cows produced 40 lbs. or more of fat.



DODGE BROTHERS
BUSINESS CAR

It is used on so many farms because it has shown itself so satisfactory in farm work

It is always ready and willing to carry the load; and the cost of its hauling is consistently low

It is essentially and primarily a work car for the farm, and it does its work thoroughly and well

DODGE BROTHERS, DETROIT

Cow Waters Herself

with this wonderful new Libbey Automatic Water Bowl. Animal moves lever, opening water valve, when it starts to drink. Lever swings back, closing valve, when animal stops drinking.

15% More Milk

Milk is 87% water, and cows cannot give their greatest yield unless they have plenty of water constantly within reach. Farmers who use Libbey Bowls report an increase of 15% to 20%, which soon pays for the bowls.

(5)

Libbey Automatic Water Bowls

are the most sanitary and successful ever invented. Each bowl controls its own water supply, operated entirely by cow, and may be put at different heights, or in any stall or pen. No float tank required. Cannot overflow; cannot get out of order. Almost no water left in bowl to become stagnant. They save labor and feed and increase milk. Prevent spread of contagious diseases, as each cow has her own bowl and no water can pass from one to another, as with old-style bowls. Very simple and easy to install. Write for circular and prices, also FREE DAILY MILK AND FEED RECORD.

If interested in Stanchions, Stalls, Carriers, etc., ask for free General Catalog.

Primrose Prices Have Been Reduced See Your International Dealer

In the unequalled success of American dairying the Primrose Cream Separator has played a prominent and deserving part. The Primrose is today the highly perfected result of many years' improvement and betterment. In design and workmanship it is a quality product entirely worthy of the 90-year manufacturing record of this Company. **With the present price reductions,** Primrose will help more and more farmers to a realization of maximum profit.

Dairying yields the utmost in final results when a Primrose Cream Separator handles the milk. The efficient record of tens of thousands of Primroses in the hands of individual owners makes that statement authoritative. Study the Primrose and take advantage of Primrose lower price at the stores of the International dealers.

Dairy Farming the Most Permanent Industry

(Continued from page 584)

high prices are falling through, and banks are unable to assist farmers by making loans. In Wisconsin, primarily a dairy state, conditions are much better in spite of decreased prices. Banks are still able to take care of the needs of farmers, and farmers seem to be able to "scare up the cash" with which to meet their debts. Why? Because diversified farming with the timely aid of dairy dollars can meet and is successfully meeting the emergency.

Fifth—The dairy herd conserves and even increases soil fertility, assuring good yields of farm crops in future years. At the same time the herd provides a sure, prompt, and profitable outlet for grains and roughage grown on the farm. Land that supports good dairy herds becomes richer year by year, whereas land devoted to raising grains and hay for market soon becomes sadly depleted unless carefully managed and unless commercial fertilizer is purchased. Every ton of corn sold off the farm, worth in normal times about $20.00, takes with it $6.50 worth of plant food; every ton of wheat worth $35.00 takes $17.00; every ton of butterfat worth about $1,000.00 takes away only 49 cents worth of plant food! Meanwhile the herd is returning many times this amount in fertility. It pays to market crops in the milk can. Keep these facts in mind when you haul away your next load of oats or hay.

Sixth—Our biggest and most successful dairymen, with years of practical experience to back up their statements, say, "The dairy crop is the only one which has never known a complete failure". They base this statement on a few simple facts. In the first place dairying is more quickly adjustable to new conditions and prices than any other kind of farming. We can easily see why. Field crops are marketed once a year, and the price is forced down—temporarily—because of the overload of any single crop on the market. The marketing period is not distributed. To purposely hold for higher prices means to wait for the money tied up in the crop. Not so with the dairyman. He markets his "crop" every day, or every few days at most, and is paid once or twice a month or oftener. His returns no doubt do vary in times such as the present when all lines of industry are being readjusted, but a few months of low prices do not condemn the industry. The reasoning farmer notes a drop of 15 to 25 per cent in milk prices, then compares this to the drop of corn from $1.50 per bushel to around 60 cents, and pork from 23 cents to 9 cents. He figures his average earnings for the last two years and is satisfied. He knows that no business is entirely free from ups and downs; he also knows that none are more highly favored than dairying in this respect.

Seventh—The dairy cow is a home builder. Farming, no matter how profitable, never reaches the position of dignity which is its heritage until the farm home becomes so attractive that it is the greatest pride of the entire family, something to be handed down from generation to generation. The growing boy or girl does not look forward with pleasure to the time when they will inherit a mortgage-ridden, impoverished ruin. They do thrill at the thought of a farm both fertile and fair, stocked with the blood left as the breeders' handiwork of father and grandfather. The dairy herd always has stood and always will stand as a symbol of permanence for the good farm, the real farm home, the farm from which the boys are not easily attracted to the job in the city nor the girls lured away to the office.

The truth of these rather strong statements may be severely attacked. They may raise a lusty howl of dissent and disapproval from the fruit farmer and from the grain grower; the corn and hog raiser of the corn belt may cuss us and threaten bodily harm. But we are in possession of facts and proofs sufficiently strong and numerous to refute any arguments they may advance.

Dairyman Uses Movies to Advertise Milk

HOARD'S DAIRYMAN:—J. Frank Frain, one of the dairymen supplying milk to consumers in Winamac, Ind., has adopted the plan of advertising milk from his accredited Holstein herd to users by way of slides run at the Isis theater, a local moving picture house. These have been running for over a month now, and Frain claims that his new customers and enlarged orders show him that this method is getting results. Frainholm is the name of the dairy and it has a peculiarly melodious sound which makes it an asset in the advertising. Copy taken from some of the slides follow:

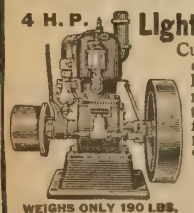
1. "We buy Christmas Seals to care for tubercular patients. To keep from making more patients, buy milk from Frainholm Holsteins—only herd state and federal tested for tuberculosis."

2. "Over 3,000 people die every week in the U. S. from tuberculosis. Children contract the disease readily from tubercular milk. Herds apparently healthy often have 90 per cent tubercular cows. Write your senator to support the bill requiring all milk cows to be tested for TB."

3. "Frainholm Sanitary Dairy uses a covered mechanical milker which excludes all foreign matter including hair, dandruff, alfalfa—even to chalk water, fish, and tadpoles. Satisfaction guaranteed. Herd TB tested."

4. "Senate bill requiring all milk cows to be TB tested has been indefinitely postponed. But death from TB was not postponed in the case of one man in the county the past week."

5. "We are glad to rectify any mistakes in our delivery such as giving a pint of cream instead of a pint of milk, or a gallon of whole milk for skimmilk, etc. Call the Frainholm Sanitary Dairy. TB tested by Uncle Sam."



6. "Doctors claim that cow TB can be transmitted through milk to human beings. Why take the risk when you can buy milk and cream from Frainholm Holsteins? Health guaranteed by Uncle Sam."

7. "Money refunded on any bottle of milk containing any foreign matter, filth, froth—frills, feathers, frogs, or fishes. Telephone your troubles to Frainholm Sanitary Dairy. TB tested by Uncle Sam."

8. "Milk from untested cows can be rendered perfectly safe for human consumption by heating to 145° for 30 minutes. Frainholm Holsteins are approaching their fourth semi-annual test for tuberculosis. Only federally inspected herd."

The local movie house runs films at least three times a week and often has extra shows. The capacity of the

house is about 350 and the management advertises the shows well so the house is usually well filled. These slides are run for $1.50 a month for the first slide and 50 cents for each additional slide. So if a dairyman runs five for a whole month, the charge would be $3.50 for the month and the slides may be changed as often as the dairyman cares to make new ones to replace those that have been run. Frain changes the slides every two weeks as he figures that the same persons do not come to the cinema house oftener than once every two weeks as a rule. He is, however, taking definite steps to find out just how frequently folks do attend.

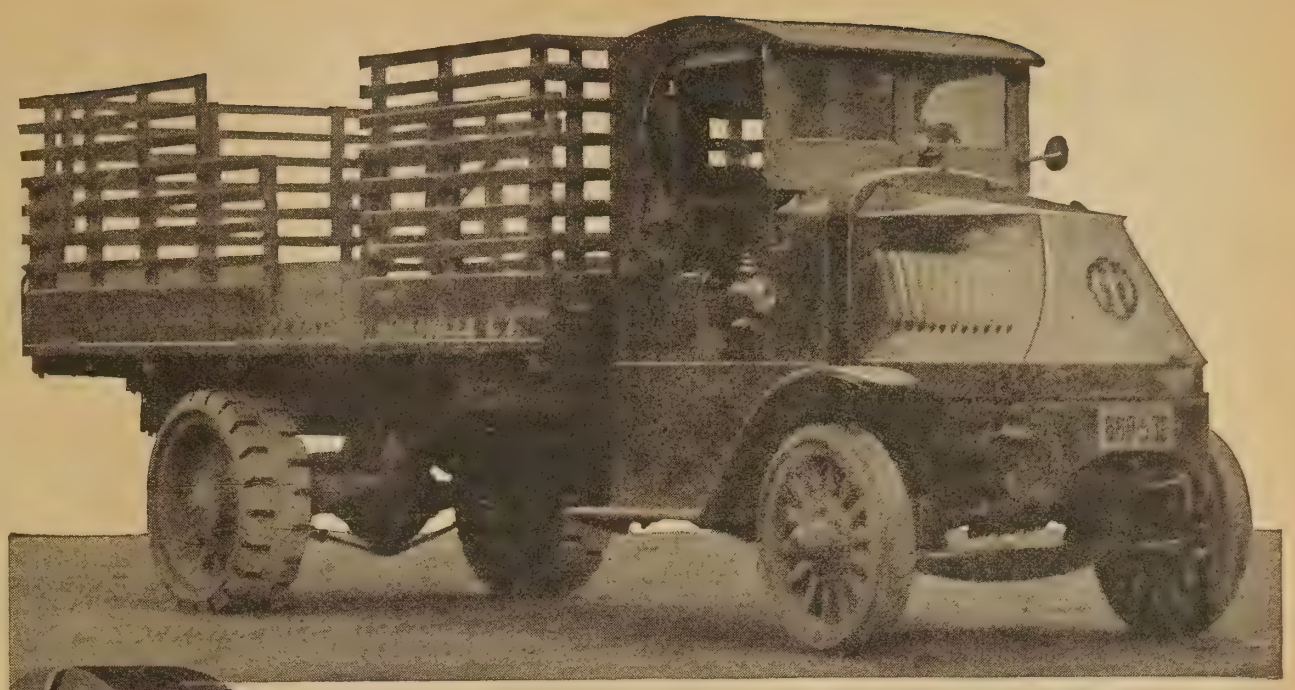
Just a word as to how the slides are made. For this particular use, window glass serves well. It can be cut into the correct size at the drug store and a few cents will buy glass enough to make several slides. Take a piece of paper the size of a slide, rule off a rectangles slide size, then lay off margins and rule lines for the writing. Put the glass slide on top of this, wipe the top surface with a cloth just moistened in turpentine and as soon as this dries, write the message, using India ink. Do not get too much turpentine on the cloth, just a "smell". A little experience and one will be able to write without having the ink run into blots. When a new slide is to be made, the old writing can be readily removed.

From the standpoint of advertising, Frain believes he gets good value. He claims that in a picture house, all the patron's attention is given to what is on the screen; it is not dissipated on other things besides the slide. From the standpoint of individual promotion work, these advertisements quoted embody some essential points:

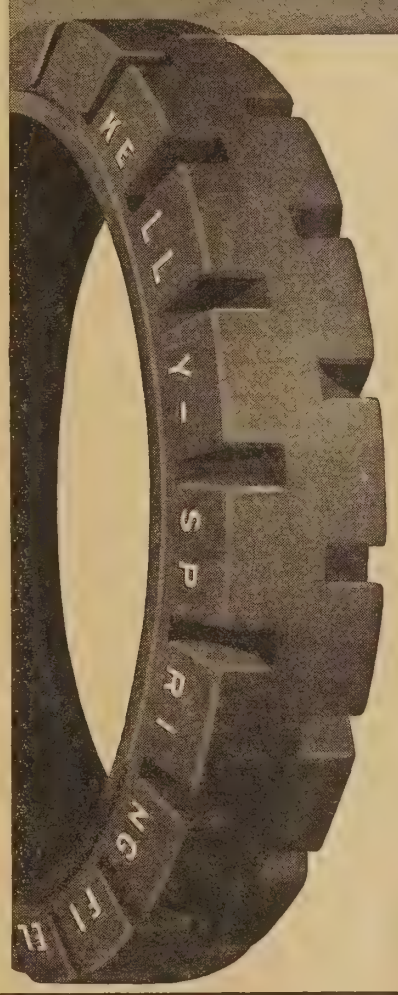
1. Each slide mentions in some way the particular dairy doing the advertising.

2. The point is made prominent that "Uncle Sam" is behind the TB test. In other words, the customer is not taking the producer's word on this vital matter.

3. The abstract facts about tuberculosis are coupled with concrete current events with which the consumer is familiar.



4. An element of humor keeps the continuous mention of tuberculosis from becoming unduly depressing. In a city where the milkman is not known personally, this humor might be harmful but in medium sized towns where the milkman is personally known by many, the humor serves a useful purpose.



Any man interested in dairying knows that three things are in order just now. One of them is to raise the quality of cows kept, the next is to raise the quality (cleanliness) of milk put upon the market, and the third is to raise the quantity of milk consumed. Frain's next batch of slides will tell the food value of milk as compared with other products, some of which are not foods at all.

In this particular case, Frain's herd is the only one on the accredited list. It is easy for him. It might not be so easy in some towns where all herds are accredited. In such a case, the greatest good would come from all milkmen going in together and having the slides run at joint expense, running one slide which listed all dairies on the accredited list. However, it would benefit all dairymen to run slides advertising the food value of milk and comparing it with other materials offered prominently in the local market.

Indiana. I. J. MATHEWS.

Uncle Ab says: Happiness is a good deal like honey; you can't hand it to others without having at least a little of it stick to yourself.

Motor trucks are seldom worn out; they are usually pounded to pieces

It is the constant pounding over rough roads that gradually weakens a truck's resistance and finally sends it to the junk pile.

Naturally the truck owner is deeply interested in anything that will minimize the effect of this pounding and prolong the useful life of his truck. This is especially true of the farmer, because the truck is usually the most costly piece of machinery he has to buy.

That is one reason you see so many Kelly Caterpillar Tires on farm trucks. Their unusual volume of rubber and patented side-vent construction make them exceptionally resilient and enable them to absorb the destructive road shocks which ordinary tires pass on to the truck.

Made in sizes suitable for trucks of all types and weights

COOL MILK INSTANTLY

Halt germ growth—remove animal and feed odors—stop waste and loss. Leading creameries and producers recommend The Improved CHAMPION Milk Cooler—Aerator. Folder free.
Champion Milk Cooler Co., Dept. D, Cortland, N.Y.

Eggs, Baby Chicks

8-week-old pullets. Won over 2,500 prizes 1917-18. Furnished U. S. Government and state schools, stock, eggs, chicks. Safe delivery guaranteed. Eggs, $8 per 100, 50 for $4.50, 15 for $1.75. Chicks, Barred, Buff, White Rocks, S. & R. C. Reds, R. C. Blk. Minorcas, Buff Orpingtons, White Buff, Silver Laced Wyandottes, S. C. Anconas, $18 per 100, $9.50 per 100, $5 per 100. 8-week-old pullets $1 each. S. C. White and Brown Leghorn chicks $15 per 100; 50 for $8; 25 for $4.50. 8-week-old pullets, 85c each. White Orpingtons, Black Langshangs, Partridge Wyds., Columbian Wyandottes, Light Brahmas, S. C. Blk. Minorcas, R. C. Anconas, chicks $21 per 100; 50 for $11; 25 for $6; 8-week-old pullets $1.25 each.

STERLING POULTRY FARMS
Box H, Sterling, Ill.

Save your temper, your cows, your milk. Does not excite the cow, nor disturb the flow of milk. Indispensible for breaking heifers, cows with sore teats, or vicious kickers. Cannot wear out. Put on or off in 15 seconds. Guaranteed to be an absolutely perfect anti-kicker, or put on loosely as hobble for cow, horse or mule. Price $1.15 Postage extra. Weight 2 lbs. Send for it **today**, when you need it you won't have time.

Subscription Rates

Subscription in United States and Mexico $1.00 per year; 3 years, $2.00; Canada, $1.50 per year.

FOREIGN SUBSCRIPTIONS may be sent through news dealers and book sellers in all foreign countries.

All foreign countries in the Postal Union $2.50 a year; not in the Postal Union $3.00, including postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittance for subscription. The receipt of Hoard's Dairyman is sufficient notification that money has been received. The label on the paper will show date to which subscription is paid. in case of renewals, if date on label is not changed within two weeks after remittance is sent, inform us at once.

We solicit advertisements of meritorious articles needed by the farmer. We try to keep our advertising columns clean and wholesome, that they may merit the patronage and confidence of our readers. Unwholesome, immoral, and quack medical advertising are excluded. A sincere effort is made to exclude frauds, irresponsible and unscrupulous firms. We will always take it as a favor to be notified whenever any advertiser's dealings with a subscriber are in bad faith or evidence a lack of business honor. Advertisers generally recognize the readers of Hoard's Dairyman as an up-to-date class of farmers, who farm with business-like methods, and we hold our columns for the patronage of only those with whom our readers can deal with profit and satisfaction.

ADVERTISING COPY must be received eight days previous to the date of publication. Advertising to be classified or changes in advertising must reach us twelve days previous to date of publication.

Entered at Fort Atkinson, Wis., as second class matter.

Uncle Ab says: The man who thinks he has a mean job has one; and the man who is proud of the place he fills in the world has a right to be proud.

New York Milk News

HOARD'S DAIRYMAN:—Was it "Uncle Ab" who observed, "if we were happy all the time happiness would lose its flavor?" At any rate we have little to fear in that line when we consider our present co-operative problems. League matters look brighter but we have had a serious time for six months or so. Doubtless we will see other troubles before we are out of the difficulties. We will never be out so long as we continue to try to have a voice in markets. There is considerable to say now in relation to milk but our more serious difficulties at present seem to be along general lines of co-operation.

The Progress of Pooling

It has seemed to me for some time that we can pool milk in League territory by May first. It cannot be done before that. At this moment it looks a very little in doubt if we can get the fifty thousand by that time. If not we wonder if our prices will have to be dropped on the first. If we pool we look for a continuance of the present prices. We are above 47,000 at this moment. Can we get the other three thousand in three weeks?

Nearly all the dealers have practically agreed to co-operate in pooling when they get the orders from the League. There are a few who haven't. One recently posted notices that they would not receive milk from any who sign pooling contracts. This we regard as bluff. Nestle's refuses to deal with the League thus far. In territory where they operate most widely the League has secured a large number of small plants and is expecting to be able to take care of nearly all the milk there. In the place of twelve or fourteen plants that are owned and have been operated by the League there are now thirty-seven either operating or ready to be operated. If the Nestle's Company continues to try the fight game, it will mean some hardships for us in the pooling contract but we are ready for the test if necessary and our members will stick.

Active Demand for League Products

In the fourteen League plants recently in operation there were a number of thousand cans of milk taken in each day. The amount is constantly increasing now. A number of other plants were opened on the first of April. Cream is also received at Auburn. About 2,000 lbs. of butter a day are made and at that rate all orders cannot be filled. Considerable milk is evaporated. Some milk is shipped to New York and goes to dealers there, while a large amount is daily shipped to the League plant in Newark to be placed in stores. Over five hundred cans are condensed.

In all lines there is now an active demand for the products. Even the dry milk situation is clearing up and accumulations are being sold or are already gone. Butter is generally being sold to grocers about League territory and the condensed and evaporated goes out through the regular channels of trade. In a few cases there seems to be some disposition to discredit the butter, but we fear it is being done in the interests of oleo which is getting quite a set-back in League territory. Not that oleo or butter substitutes get too little favor now, but less than before we began to show it up and to insist on the greater desirability of using butter.

The Filled Milk Bill

There is little doubt that we will have further trouble with butter substitutes. We are certainly having something with cocoanut oil in condensed and evaporated milk and in other ways. A car of such oil came right into our territory for such purposes recently. A bill is now before our state legislature to prohibit its use in the place of butterfats. I have a letter this morning that indicates that the bill may pass, but we do not know that to a certainty yet.

The Delaware and Greene Creamery

Much is being made by dealers, or what seems to be the dealers, relative to the big milk plant known as the Delaware & Greene Creamery Co. The statement sent out to local papers all over the territory is not signed and its authorship is unknown. The concern has proved to be in bad shape and I knew that it must come to that for it started with too little capital. It is useless to start a co-operative plant unless the members are in sufficient numbers and willing to take up the necessary burden. I do not know who are to blame and it may be no one in particular. I have reason to believe that those farmers who went into it and who have worked so hard to make it a success have been loyal men and deserve well of their neighbors. It was too big an undertaking without more support. These news items are gotten into the local papers to cast some reflection on the League.

It is not a League plant but the League did try to help them out and would have done so if it had been possible. I have a statement before me from the League office as to the figures involved. There is no blame to be placed on the League and it would be no use to mention it were it not for the anonymous news items sent out from somewhere. The figgures indicate a mistake on the part of the local people who felt that it would be possible to get ahead on the small capitalization that they had. It is worth noting, for such mistakes have been made in many cases. It is a bad idea to go in until the way can be seen clear as to support.

With milk problems looking brighter, with feed questions in the balance, and with general co-operative interests getting a rather black eye so far as the general public is concerned we have enough to keep us interested. We can be happy if we like this sort of a thing.

New York. H. H. LYON.

Washington, D. C., Weekly News

[Special to Hoard's Dairyman.]

WASHINGTON, APR. 12:—Strong efforts are in evidence to secure the appointment by Secretary Wallace of Prof. William Frear of Pennsylvania State College to succeed Dr. Carl L. Alsberg as chief of the Bureau of Chemistry. Dr. Frear is a chemist, educator, administrator, and business man of high repute. Other men mentioned for this post have been mentioned in this correspondence. The appointment is expected soon.

⚜

The opening of Congress Monday was marked by the introduction of over two thousand different bills. The one which has dairy attention is the emergency tariff bill. The butter item remains at six cents a pound, and milk, cream, and condensed milk remain exactly as in the bill passed and then vetoed by President Wilson. The message of President Harding asks for "instant action" in the passage of this bill. It calls attention to the fact that it is " for the emergency only" which means that dairy interests must redouble their energies if they wish permanent tariff equality for their products. Of all the items in the emergency bill there is not one which has a stronger continuing argument in its favor, as shown by the trend of imports from which protection is demanded, than dairy products.

⚜

The Republican membership of the House Committee on Agriculture has been announced. Hon. Gilbert N. Haugen, staunch friend of the dairy industry, remains as chairman, with his committee made up as follows: James C. McLaughlin of Michigan, Charles B. Ward, Fred S. Purnell, Edward Voight, Melvin O. McLaughlin of Nebraska, Carl W. Riddick, J. N. Tincher, Thomas S. Williams, James H. Sinclair, Edward O. Haye, Charles J. Thompson, Fred B. Gernard, Frank Clague, and John D. Clarke. The last seven are new men.

⚜

The officers and directors of the National Association of Milk Producers opened a two-day session here on Tuesday with President Campbell of Michigan presiding. Plans for increasing their Washington representation, securing a manager in place of W. G. Warber, and for participating in the inter-organization conference, were the chief items of business. In an address Tuesday President Campbell said that their reports showed that the activities of their member organizations showed a net increase in revenue of not less than $60,000,000 a year to their members, at an operating cost for the entire group of not nearly a million dollars per year. He cited this as the clearest evidence of the success of co-operative marketing, and the need for legislation to make the legal status of these organizations above criticism.

⚜

Following the farm bureau, grange, milk producers, and inter-organization conferences and meetings this week, there will be held two big meetings next week of great interest, a mass meeting of the National Farmers' Union and of the first meeting of the newly organized National Union of Farm Loan Associations. Both these sessions will open on April 20, at the rooms of the National Board of Farm Organizations.

National Dairy Marketing Conference

The American Farm Bureau Federation has issued a call for a dairy products marketing conference to be held at the Congress Hotel, Chicago, Ill., at 10 a. m., May 3rd and 4th. The program will be divided into three parts: Present methods of marketing milk and other dairy products, problems of milk producers' associations, and plans for unorganized territory.

There are a number of successful co-operative milk producers' associations and marketing companies and many of them have been invited to send representatives to this marketing conference for the purpose of giving information concerning their organizations. It is planned that both the large and the small cities will be represented. It is hoped that through the information they can give a more uniform plan of organization can be perfected and plans can be worked out for unorganized territory.

The creamery and the cheesery will be discussed as they relate to the producer and to diversified farming and methods of co-operative marketing butter, cheese, and by-products will receive full consideration. The purpose of this conference is to gather information which will assist in marketing dairy products more economically and how to obtain better returns for the dairy farmer.

Washington A. F. B. F. Conference

[Special to Hoard's Dairyman.]

WASHINGTON, APR. 12—The American Farm Bureau conference on legislative matters which has been in session here this week has developed several items in a legislative platform which are of much interest to American agriculture. President Howard is presiding and the entire executive committee is all present except one or two and a delegate is present from most of the state federations. In point of numbers and farmers represented it is the largest gathering of farm organziation representatives held here in some time.

Proceeding without a program, and in semi-executive session, the conference first discussed in a general way the problems of the farmers of various parts of the nation, as represented here, and then the various legislative propositions which might be hoped for or expected to assist them in improving social and economic conditions. It soon developed that financial legislation, better credit for farmers, occupied first place. The need of legislation clearing the right of the farmers to bargain collectively for the sale of their products was very near the front and tariff legislation, increased functioning of the department of agriculture, and export trade facilities were the other leading subjects. General questions affecting taxation were also found to be of general interest.

Following the policy of getting the highest authority possible to furnish the desired information, the conference at its opening afternoon's session heard A. F. Lever, member of the Farm Loan Board and former chairman of the House Committee on Agriculture, and Governor W. P. G. Harding, of the Federal Reserve System, on the subject of rural credits. Commissioner Lever urged the strong endorsement by the Farm Bureau of the proposed amendments to the Farm Loan law, whereby the land banks can be supplied capital for loans to farmers on commodity security, evidenced by warehouse and storage receipts. This proposal was placed before Congress at the last session as the Dickenson bill in the House, and the Kenyon bill in the Senate, and is to be reintroduced in nearly the same form. Governor Harding of the Federal Reserve system made the suggestion that a working capital and reserve fund for this purpose could be easily provided out of the earnings of the Federal Reserve system. These earnings total a hundred million dollars in the past year, it is said. The law now provides that the earning may be used only for the purchase of U. S. bonds, or to be added to reserve funds. To use this for the proper foundation and protection of a rural credit system, in Governor Harding's opinion, would be a more useful direction of these funds than in any other way.

Following this the collective bargaining situation was brought up. Great regret was expressed at the failure of Congress to enact a workable and satisfactory law at the last session. Representatives of various state bureaus spoke of the special interest of the fluid milk organizations in this subject. Representatives of milk producers' associations have more frequently than any other representatives of agriculture been subject to prosecution on charges of violating the anti-trust laws as they may apply to monopoly control of farm products. The recent Louisiana case was referred to, calling attention to the fact that the courts there had held that the present law—the Clayton amendment—was sufficient to permit farmer producers to organize and market their own products, but in other states, it was pointed out, New York, Ohio, and California, in particular, federal and state officials have made several attempts to interfere with the work of the associations in such a way as to seriously interfere with the progress of the form of co-operative marketing operations.

Assistant Chief Hiller of the Bureau of Markets discussed the legal features of this plan and its relationship to the anti-trust laws. There was much of interest in this discussion in relation both to the general question of the legal advantages and disadvantages of co-operative organizations in general, and the particular problems of the milk distributors. The conference passed on to the next subject without formulating any resolution or statements on this subject, but it is certain that a strong demand for laws which will make it possible for farmers to form co-operative organizations and sell their own products will be made.

Professor Adams, treasury expert on taxation, gave facts as to the cost and collection of the various kinds of taxes comprehended in the present tax system, and some clear statements as to what might be expected in the future, showing the dwindling of the excess profits tax, the way changes in surtaxes would work, the results in revenue of the different kinds of sales taxes, the changes which would be involved in cutting off the transportation tax and the soda fountain tax, and the other fundamental facts of this problem.

The conference finds itself embarrassed by the bigness of its problems and the sectional character of the appeal in some instances, and also by the self-evident fact that, serious as are the facts which agriculture faces, legislative remedies do not seem competent to reach very far into means of betterment.

The federation representatives, before the end of the conference, are quite likely to take action toward increasing the strength of their representation in Washington. The conference has had a very enlightening effect on the representatives present, of the size and the importance of the representation of agriculture in the capital. There have been some opportunities to see, size up, and measure the representation of other industries and organizations here, and to understand the overwhelming sweep of the recent tendencies toward organization and the industrialization of government. Regardless of the good policy of class representation, it is evident that there is a mad scramble just now for class protection and class benefit, participated in by both large and small groups, and that the participation of agriculture in this scramble is a matter of self protection and absolute necessity. The situation has reached its most acute period just at this time, and the Farm Bureau conference here has seen and sensed it. The action which will result is not settled yet. It partly depends on the result of the inter-organization conference to begin on Thursday. The result of either what the farm bureaus do, or what the whole group does, or both, is likely to be the strongest and most aggressive representation that agriculture ever had anywhere in the world. Agriculture never needed it as badly as now, and regardless, as stated, of the good policy of such representation, or its possible danger in provoking reprisals and creating internal and external jealousies, it is most likely to be brought about as the result of these sessions here now going on.

Grain Marketing Plan Adopted

Committee of 17 Plan Program

The Committee of Seventeen plan is now a program. The 99 delegates, representing all farmers' organizations interested in grain marketing in all grain growing states, unanimously accepted the grain marketing plan of their committee.

This means that the United States Grain Growers' Inc. will be organized by grain growers of the United States as a non-stock non-profit corporation. Individual farmers will hold 10 memberships in this national selling agency. They will contract to sell their grain to local co-operative elevators and the local elevators will contract to sell it through the United States Grain Growers' Inc. Each farmer will have the option of marketing his grain by the usual method of consignment and outright sale to the elevator or to put it in a pool.

The plan provides for a board of directors of 21. By resolution the Committee of Seventeen was asked to divide the United States in 21 districts, and the delegates in each district will nominate directors from their district. Probably an organization committee will be selected by the delegates in each state to carry out a definite plan of getting memberships. It is expected that a share of the 1921 crop will be marketed through the new machine.

Never for a minute in the two days' heated discussion was there a note of split or quit. The big subject of discussion was an amendment introduced by C. O. Mosher of Texas, making it compulsory for each member to pool one-third of his wheat. This amendment was principally supported by the cotton growing states of the South, the wheat growing states of the Northwest where they have had experience in pooling, by Illinois, and a few scattering votes in other states. Proponents of the amendment maintained that the only way to regulate the supply in accordance with the demand was to form a pool out of which the national sales agency could hold or sell as would be necessary to prevent market slumps and gluts, and to stabilize prices. Opponents doubted the legality of the one-third compulsory pooling plan and the willingness of farmers to sign such a contract. Wm. G. Eckhardt, grain marketing director; President Howard Leonard, and Secretary D. O. Thompson of the Illinois Agricultural Association argued in favor of the amendment.

I. A. A. for One-third Pool

"We should have a pool," Secretary Thompson declared, "in which every grower should put a part of his wheat and take even the chance of losing a little in order that he may help the other fellow to make more. All honor to the Committee of Seventeen Plan, but—I believe the one-third pool amendment is necessary. Trust in God—but keep your powder dry."

"I know that the farmers will sign this contract and deliver their wheat," declared Howard Leonard in his address Thursday morning. "Illinois will be back of this plan."

Wm. G. Eckhardt, the I. A. A. member of the Committee of Seventeen, has worked hard for the pooling plan from the very beginning.

The session ended Thursday night and was held at the First M. E. church. The meeting started with the singing of "America" and gospel hymns. Clifford Thorne began with an address in which he argued against the one-third pool. C. V. Gregory, editor of Prairie Farmer and member of the Committee of Seventeen, followed with a strong rebuttal.

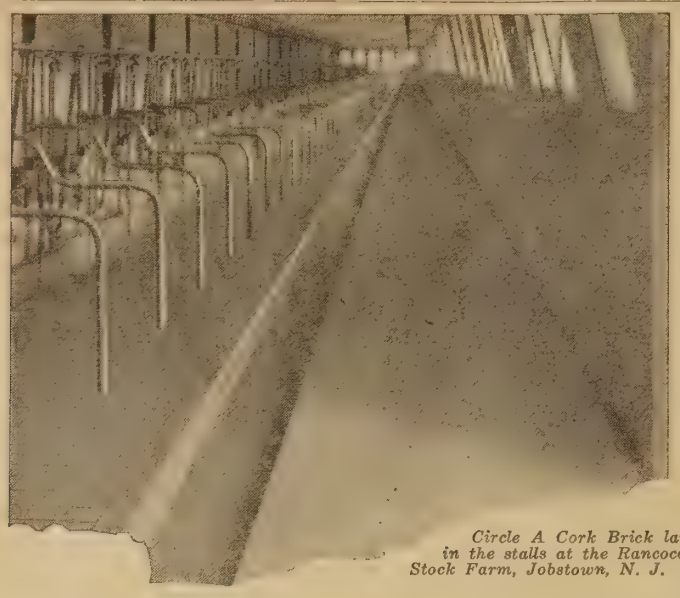
Compulsory Pool Voted Down

The vote on the amendment was 38 for the amendment and 61 against. Ten of the fourteen Illinois delegates voted for it. This question had been up before the Committee of Seventeen and they stood four for the compulsory pooling and twelve against, one member not voting.

Committee Plan Unanimous

Then the vote came on the original plan with a few minor changes. No ballot was necessary. At the call of the president, J. R. Howard, of the American Farm Bureau, for the vote in favor, there was an overwhelming outburst of "Ayes", and when he asked for the "Nays" you could have heard a pin drop. "Blest Be The Tie That Binds" was in the air. When the hymn was ended three or four men wanted the floor all at once. They were proponents of the one-third pool plan: the northwestern wheat growers, cotton growers, Illinois delegates, and all of the others that had argued for the pool plan. They stated they were behind the plan with every ounce of energy they had and would do all within their power to make it a success.

All the farmers of the United States have agreed upon a plan of co-operative marketing, by which they hope to stabilize prices and get a fair return for the grower.



H. C. Wallace—Secretary of Agriculture

"Nobody has ever disputed the right of the manufacturer to market his own products," declared Secretary Wallace, who spoke Wednesday afternoon, "and I don't see how anybody could justly deny the farmer the same right. It has too long been the case that the farmer was expected merely to produce and to take his chances on somebody else's market.

"There is just as much reason why the United States Department of Agriculture should assist in intelligent marketing as to promote increased production. It is our business to reach for methods of getting products to the consumer efficiently.

Hoped Plan Would Be Adopted

"For the good of producer and consumer, I hope you will adopt this grain marketing plan. It will put you on a basis to intelligently study marketing methods. As producers you are the best in the world, but as salesmen you are rotten. You have put all of your energy into production and paid no attention to marketing. That is the business side of the game."—Illinois Agricultural Association.

Circle A Cork Brick laid in the stalls at the Rancocas Stock Farm, Jobstown, N. J.

"For the Money there Is in It"

IF you have a feeling that Circle A Cork Brick are "fancy" equipment all right for the barn where profit is no object, but impractical for the dairyman whose herd is his bread and butter, read this letter. A. G. Stone and Son, Hudson, Mich., are business men and their experience has a practical value for you men who run dairies for profit.

"I am writing you in regard to our Cork Brick floor, which we installed six years ago. There seems to be a notion among some people that the use of Cork Brick is sort of fad, but we consider that it is an essential part of a good modern dairy barn. We follow dairying for the money there is in it, and in no sense are other than practical. Before we built our new barn, we had a good deal of experience with both wood and cement floors, and they were never very satisfactory.

"We were induced to try Cork Brick and though somewhat skeptical, finally put them in and have been more than satisfied with them. They are very easy to put down and in the six years that we have used them, there has not one come out of place or broken. The bedding stays in place, well up under the cattle's fore feet, which is not the case with cement, and I have never seen a cow slip on them since putting them in. We have never been troubled with any of the diseases common to cows that lie on cold and unsanitary floors and we most certainly recommend them to anyone who cares for the comfort and health of their cattle."

For you, as for these men, Circle A Cork Brick are protective insurance. They conserve health and increase comfort, the two factors most vital to the profitable productiveness of dairy cows.

You will want to know more about cork brick floors. Write for the 28-page book, "Better Stall Floors." There is no charge and a copy will be sent promptly with a sample brick.

Armstrong Cork & Insulation Company 112 Twenty-fourth Street, PITTSBURGH, PA.

What Drainage Has Done for Middle West

(Continued from page 580)

and the co-operative plan must be used.

First, and simplest method, is for a group of farmers to band together under a common law agreement, put in the outlet drain and connect up individually with their small farm drains, paying for the improvement outright and making an agreement among themselves as to the amount of the expense each one shall bear.

Second, is a similar co-operative plan which has some jurisdiction from the county court and,

Third, is the more businesslike and therefore the most commonly used—the incorporated drainage district.

Proceeding for forming a co-operative drainage district is started by petition of some farmer or group of farmers who feel that they need an outlet for farm drains. Petition is therefore circulated among those who it is believed will come within the required section or district. The size of the district depends largely on the area of land which falls within the given drainage area which can be served by one or a few outlets. The outlet drain must go far enough to carry them to a natural outlet for the drainage or to connect legally with an outlet from a neighboring drainage district.

If the court finds that the expense appears to be warranted, and that the improvements will exceed the amount of damages to property, etc., he is empowered to authorize that the proceedings shall progress in the usual manner. If a ditch must be cut across some farm, temporarily throwing out of use a certain amount of land, this is considered damage to that property and the owner has to be reimbursed.

One growing tendency is to eliminate almost entirely what have previously been termed damages to the land. Except in extreme cases, it is possible to use large tile instead of open drains. The sketch in Figure 1 shows comparative carrying capacity of the large tile drain with an equivalent cross-section drainage ditch which will be required to carry the same capacity under good conditions. The open ditch, however, in certain periods will grow full of weeds which will interfere with the flow or under certain soil conditions will gradually fill with silt and soil which slips from the banks under heavy rains and floods. The open ditch is the most inefficient type of drainage but of course is required under certain conditions where a tremendous amount of water must be handled at various periods. In Iowa and Minnesota, drain tile even as large as 72 inches in diameter are used for outlet drains. These ditches are then back-filled and farming goes on as usual.

An open ditch wastes valuable land. An open ditch 14 feet wide at the water line and 8 feet wide at the bottom and with sides sloped 1:1 will have approximately an equivalent carrying capacity to a 48-inch drain tile, assuming that the fall is about one foot per mile in each case. The possibilities of the tile and the ditch are figured by means of formulae in common use by drainage engineers.

Figure 1 shows the loss of tillable ground when the open ditch is used. Assuming a strip of land 80 feet wide, required for such an open ditch, an acre of ground is lost to farming for every 544 feet in length. Assuming that such a ditch were to cross 80 rods of one farm, there would be lost 2.43 acres of valuable land. In addition, there is a damage from such a ditch due to weeds, inconvenience in farming irregular areas, and cost of upkeep for bridges to cross the ditch, etc. In average soil, it would be difficult to maintain a slope as steep as 1:1 for the sides of the channel would soon fill and render the ditch inefficient. Therefore, under ordinary circumstances, an even wider trench would be necessary to handle the same amount of water.

It is common knowledge that the crop yields begin to increase almost as soon as drainage improvements are made. A fresh example comes from Chickasaw County, Iowa, a county which has unusually rich black loam soil. A fifty-acre tract upon which a crop report has just recently come in was tiled in 1916, previous to which time the ground was worthless. The 1918 crop produced 76 bushels of oats per acre, 1919 crop produced 60 bushels of corn per acre.

So extensive has this work become, that it is nothing uncommon for one county to spend one million dollars in one year on drainage district improvements. This, in addition to the small lateral tile placed by farmers, gives the reader an idea of the magnitude of the drainage development in the middle west. The reclamation of hundreds of thousands of acres annually is now going on and, in some states, the work has only just begun. The result of tile drainage in this area is the opening for service of some of the most fertile and productive land in the world.

H. J. Goelzer's Biennial Sale

H. J. Goelzer held his sixth biennial sale at Plymouth, Wis., April 1, selling 88 animals for a $236 average with $530 the top price. F. W. Traxler paid this for an excellent 7-year-old granddaughter of Piebe Champion.

Emil Zager, Wisconsin, paid the same price for Nancy Johanna Sarcastic Melchior, a very good five-year-old.

Krause, Wolf, and Schrage did the selling with J. G. Voss in the box.

Following is a list of those animals selling for $300 or more and buyers:

F. W. Traxler, Wisconsin	
Lillian Clothilde Challenge	$370
Quinello Lillian Johanna De Kol	305
Irene Johanna Melchoir	450
Pietertje Gipsy Queen De Kol	500
Segis Cornucopia Hengerveld De Kol	400
Korndyke Melchoir De Kol	305
Rosa Beauty De Kol	530
Lady Bonheur Johanna	300
Piebe Ormsby De Kol Abbekirk	350
Belle De Kol Segis Hengerveld	310
Wm. Zemke, Wisconsin	
Teddy Johanna Segis De Kol	$450
Lina Pietertje Johanna Mercedes	$430
Chas. Miller, Wisconsin	
Fanny Maudina Pietertje Johanna	$340
M. P. Andrus & Sons, Wisconsin	
Crosby Johanna Pietertje De Kol	$375
Wm. Ford, Wisconsin	
Mamie Johanna Segis	$375
Emil Zager, Wisconsin	
Tilda Pontiac Yesletine	$470
Nancy Johanna Sarcastic Melchoir	530
Arno Hueppchen, Wisconsin	
Catalog No. 30	$420
W. Krause, Wisconsin	
Clothilde Shadeland Dudley	$500
G. Y. Kempink, Wisconsin	
Johanna Mercedes Princess 2d	$300
Otto Zemke, Wisconsin	
Ruby De Kol Mechtilde Korndyke	$360
Delores Marie Pontiac De Kol	365
Otto Helmer, Wisconsin	
Scout Valley Topsy 2d	$300

Jersey Cattle Notes

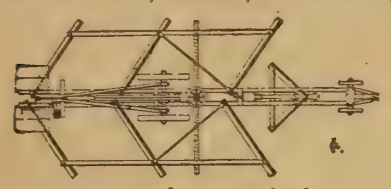
For week ending April 1:

Number of animals registered: Bulls, 189; cows, 608; total, 797. Number of transfers recorded: Bulls 155; cows, 607; total, 762.

Inventions and Appliances of Interest to Agriculture

Turning Bolster

This bolster is designed particularly for two-wheeled trailers. It is of the ball and socket type, and has two sets of springs which permit the trailer and tractor to oscillate end-

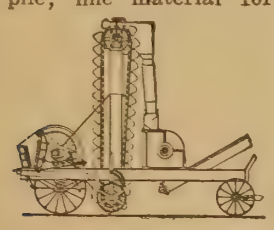


wise and sidewise without undue stress on either.

(Wm. G. Hesse and Son, Leavenworth, Kansas. U. S. Patent, 1,330,805.)

Road Scraper

The V-shaped plow here is driven by a push bar, running from behind its nose to the central frame members; this puts the strain where it belongs on the nose and central frame. The three pairs of scraper blades are carried by the main frame, and are raised, lowered, or steered by



an operator on the rear platform.

(Chase Foundry and Mfg. Co., Columbus, Ohio. U. S. Patent, 1,330,783.)

Portable Crusher

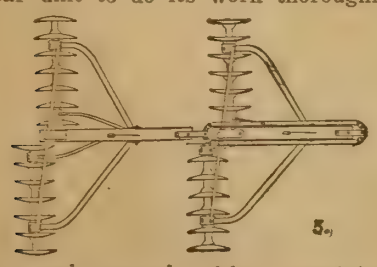
The important feature here is that the jaws are low and can be fed from the ground. Coarse material for road-making is crushed and discharged from the elevator to wagons or a pile; fine material for agri-

cultural purposes is crushed and then powdered in the impact pulverizer.

(Allis Chalmers Mfg. Co., Milwaukee, Wis. U. S. Patent, 1,331,963.)

Animal Poke

The object of this device is to prevent an animal from going through or under the wires of a fence. It is made of heavy wire and is attached



to the hide by pointed wire pins which are then bent as shown.

(D. F. Busskohl, Pedro, South Dakota. U. S. Patent, 1,332,484.)

Disk Harrow

The special feature of this tandem disk harrow is that the rear unit is connected directly to the draft point of the front unit. This permits the rear unit to do its work thoroughly

on rough ground, without straining either unit.

(Bissell Co., Ltd., Elora, Ont., Can. U. S. Patent 1,331,299.)

Canada. C. J. LYNDE.

TIMKENS MEAN - MORE *and* BETTER FARMING - BY POWER

More Extensive Yet Less Expensive Farming

Just as the reaper and binder years ago did away with the necessity of collecting, at a certain time, from six to ten extra "hands", so does the tractor replace not only horses and men, but so distributes the work that a general saving in time, men, and money results.

Whether it be a job of plowing, cultivating, threshing, potato digging, or any of a dozen and one other farm activities, the tractor must be ready at all times to take up the burden.

And so every single part of a tractor must be inherently reliable and dependable. Each part must withstand the tremendous strain to which a tractor is put. A tractor never "coasts".

When it comes to a question of bearings designers and engineers usually specify Timkens.

They know that in the wheels, transmissions, differentials, and pinion and worm mountings Timken Tapered Roller Bearings carry *all* loads no matter from what angle they are applied.

They know that when the inevitable wear that *must* follow motion does come Timkens do not have to be thrown away and replaced at considerable cost in time and money. A simple adjustment or take-up, easily and quickly made, makes a Timken Tapered Roller Bearing function as if it were new.

And they know that Timken Bearings will prolong the life of the tractor; will save time and money for the farmer; and consequently will aid in the development of More and Better Farming By Power.

The Timken Roller Bearing Co, Canton, Ohio

Timken Tapered Roller Bearings for Tractors, Farm Implements, Trucks, Passenger Cars, Machinery, Trailers, and Industrial Appliances

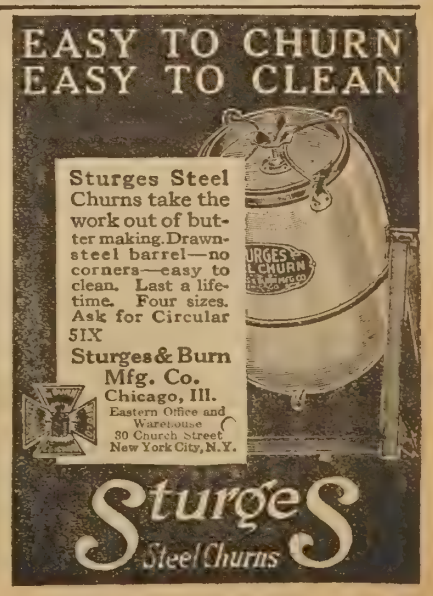
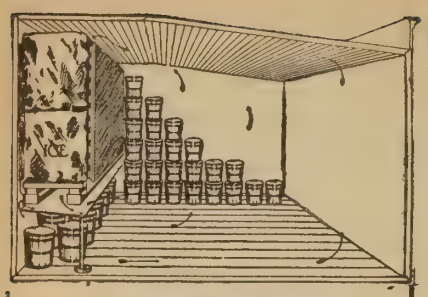
TIMKEN Tapered ROLLER BEARINGS

Tom King Makes A Start

(Continued from page 583)



staged at the Grove City dairy picnic and show he won a place as one of the members of a dairy judging and demonstration team to represent Pennsylvania at the Eastern States Exposition. This team came through with flying colors. They won first place as a team in judging and for his individual score Tom was awarded a fine pure-bred Jersey heifer calf.



Mercer County has an achievement organization of club members and vocational school boys known as the Young Farmers' Club. Membership can be gained only through some worth while achievement. The spendid showing made with his heifer and his fine record in the judging work gave Tom admission to the Young Farmers' Club and he is now serving it efficiently as secretary. Outside the field of club work he is also making good. He is in high school and is looking forward to a course in agriculture at the Pennsylvania State College.

What Tom King has done can be repeated a thousand times by other boys. There are real opportunities in the dairy club work but it requires fellows with good sticking qualities to win.

Ohio's New Jersey Champion

Miss Melia Oxford, a Jersey cow owned by L. P. Bailey of Ohio, is now junior four-year-old champion of that state. Her record is 12,391 lbs. milk, 707 lbs. fat. Her former record, begun at two years and 11 months, was 10,604 lbs. milk, 576 lbs. fat.

NORTHEY DUPLEX
Cooling Rooms
For Butter, Milk, Cheese, Eggs, Meats, Fruits, Etc.

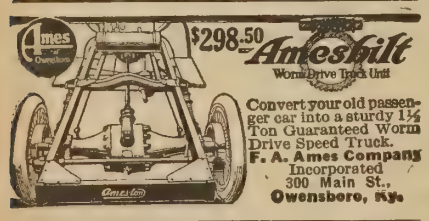
We build cold storage rooms—in all sizes—for every need of Dairies, Creameries, Fruit Growers, etc.,—arranged for side or overhead icing, and equipped for either natural or mechanical refrigeration.
The Northey Patent System saves food and ice, and gives a perfect circulation of dry, cold air which keeps all perishable food products in perfect condition—fresh and finely flavored—and prevents wastage from taint, mold or spoilage.

Write For Catalog

which gives complete information about Northey Refrigerators, Cooling Rooms, Ice Cream Cabinets, Display Cases, Cold Storage Door Insulations, etc. Our Service Department will submit plans and estimates for special work, special insulations, etc., on request.

Sold by All legitimate Dairy Supply Houses in the United States.

NORTHEY MANUFACTURING COMPANY
126 Park St., Waterloo, Iowa



Shall Your Boy Know
Modern Farming?
The Riggs Agricultural High School

For boys 14 to 17 years old prepares for Agricultural colleges. The best development of the youth. Exceptional opportunity for instruction in practical carpentry. The farm of 175 acres is fully equipped. Every facility for outdoor sports and healthful recreation is afforded. Gymnasium. Send for booklet.

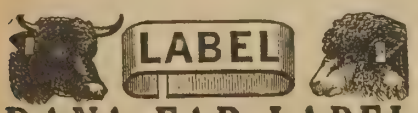
F. B. RIGGS, Headmaster,
Lakeville, Connecticut.

Learn to be an Auctioneer

Taught by the practical method. By our plan you study at home and receive a part of the commission while learning. Enroll now and be ready for the fall business. Write for our free catalog. Address
Kissling's Auction School of America, Columbus, Ind.. Dept. F, William C. Kissling, President.

Convert your old passenger car into a sturdy 1½ Ton Guaranteed Worm Drive Speed Truck.
F. A. Ames Company
Incorporated
300 Main St.,
Owensboro, Ky.

Annual White Sweet Clover
Guaranteed Seed of the Hubam or Hughes Variety



Makes growth in one season that ordinary clovers do in two. Yields under cultivation two tons hay or 300 to 800 pounds of seed. Price $1 for trial package or $10.00 per pound. A pound will seed an acre. Make a big profit growing seed for yourself and neighbors. Order before small supply is exhausted from The Henry Field Seed Company, Shenandoah, Iowa, or direct from THE GROWER WHO GUARANTEES.
THE DeGRAFF FOOD COMPANY, DeGraff, Ohio

KEROSENE ENGINES
OTTAWA LATEST DESIGN

Durable, Powerful, Reliable, Massive. Built to last; to do hard, heavy work. Uses Cheapest Fuel. Pull ¼ to ½ horse-power more than rated. **Lowest Prices. 3 Months Trial. Easy Terms.** Sizes 1½ to 22 H-P. Easy to start. No cranking. No batteries. **10 Year Guarantee.** Most practical engine ever built. Engine book free. A postal brings it.

DAIRY MARKET NEWS

New York Butter Market

New York City, April 12:—One very pleasing feature of this market of late is the improvement in quality of the butter that is being received. It is quite probable that creamery operators learned a lesson during the months which were lean for creameries which produced butter of inferior quality and have gone about it systematically to improve the quality of their butter. Reports from many sections state that systems of cream grading have been initiated in many creameries and that poor cream is being refused in other plants. While the price range between butter scoring 88 points and 92 points has been reduced to 3½c, where formerly it was as great as ten and twelve cents at times, it is quite probable that creamerymen will remember their losses during the early winter months and will attempt to keep cream grading systems in operation indefinitely. However, there is a danger that the lessons that were well learned during times of stress may be forgotten with the establishment of better times. It is to be hoped that the good work that has been started will continue as losses which will otherwise ensue during the coming fall and winter months can be avoided by so doing.

No Danish butter is known to be on the water at the present time. No other vessels will leave Denmark until April 22 and it is quite improbable that any butter will be forthcoming then as Denmark is now disposing of its entire surplus of butter to other Scandinavian countries, England, France, and Switzerland at prices above a parity with values in our market at the present time. It seems to be conclusive that we will have to depend on our domestic supply to satisfy demand during the coming season. At the present time, considerable butter is reaching this market from California but it is not expected that a sufficient quantity will be forthcoming to take the place of the Danish butter. A quantity of Danish butter, probably 7,500 casks, is still in first hands but that is moving freely and will entirely disappear in the course of a few days. There is nothing to lead one to believe that there will be a sharp break in butter prices for a considerable time.

The consumption of butter is apparently high throughout the country. Creameries in all sections report that local demand is absorbing the greater part of their output. Statistics show that there has been a material curtailment in the output of plants manufacturing butter substitutes. It is reported that several oleomargarine plants have been forced to close their doors because of the lack of demand for their products. It is quite apparent that the consuming public is beginning to appreciate the food value of high quality butter. It is hoped that dairymen and creamery operators realize that and that each will do his part to improve the butter made in our creameries.

On last week Tuesday, extras were quoted at 52c. Buyers apparently considered the price too high and ceased buying. The result was a price decline of 2½c on Wednesday. On the following day, there was a further decline of ½c. During the remainder of the week, there were no other changes and the market was steady. A firmer feeling developed yesterday and prices advanced ½c. The market is firm and active today but values have not changed. Danish butter is in demand at 47½@48c, which is the same price that is being asked for the California butter. General quotations are: Extras (92 score), 49¼@49½c; higher scoring than extras (93 score or higher), 49¾@50½c; firsts (90—91 score), 48@48½c; firsts (88—89 score), 46@47½c; and seconds (83—87 score), 38@44c.

W. B. LIVERANCE.

Cheese Trading Extremely Dull

(Report by U. S. Bureau of Markets)

Cheese prices did not show any radical changes during the week ending April 9, but the tone of the market was weak and business was extremely dull. Many distributors think the market will go several cents lower and whether their analysis of the situation is right or wrong they do not expect to buy until the drop comes or until the bottom has undoubtedly been reached. Reports from certain sections indicate that production is a month ahead of last year and that grass cheese will soon be on the market.

In the distributing markets the feeling is also weak. New York country markets are higher than Wisconsin, and considerable cheese from New York is being consigned, especially to the Boston market. The fact that so much of this is being ordered sold by shippers indicates that the feeling lacks strength. Current receipts at the different markets are irregular in quality, although on the whole quality may be classed as fairly satisfactory. The new style referred to as Sandwich cheese is becoming very popular and in certain markets is being taken by trade accustomed to buying Longhorns or Young Americas.

The average wholesale prices on American cheese (style Twins) for the week ending April 9, 1921, and for the corresponding week a year ago, were as follows:

	Week ending April 9 1921	1920
	cents	cents
New York	28.0	29.5
Chicago	20.0	29.5
Boston	23.4	30.5
San Francisco	20.5	27.5
Wisconsin	20.0	29.5

The total receipts of American cheese at these markets were 2,896,563 lbs. as compared with 1,932,562 lbs. a year ago and 2,948,160 lbs. a week ago.

Butter Prices React Downward Under Heavy Receipts

(Report by U. S. Bureau of Markets)

The firmness and good trade noted the previous week continued to advance prices on the butter markets until Wednesday of the week ending April 9. At that time a slight accumulation caused by heavier receipts and withdrawal of buying support caused a reaction. Prices have been rather high for so late in the season and in view of the recent declines in prices of other commodities buyers are operating cautiously. This has resulted in a nervous, jumpy market. Opinion generally is that the supply of fresh butter is still short and likely to be for some time yet, because no Danish is coming and only a moderate amount of Pacific Coast stock. With this in mind many look for the market to recover.

About four cars of California butter were received at New York during the week and sold at prices ranging from 1c to 2c under 92 score. The supply of Danish is working out nicely. The Frederick VIII is due but it is the general opinion that little or no Danish butter is aboard. New offerings of Danish were on basis of 49c c. i. f., but none is reported purchased.

The tone was quite a little firmer on Saturday and reports from all markets indicated that the supply of butter available was light. The net change under the Monday's price on most markets showed a decline but the difference as compared with the prices of a week previous was negligible. Undergrades have been fairly well cleared up and for this reason the range in prices between these grades and the top grades was not wide.. With the advent of more weedy butter in the market, however, this condition will undoubtedly change.

The average wholesale prices on 92-score butter at five of the principal markets for the week ending April 9, 1921, and the corresponding week a year ago were as follows:

	Week ending April 9 1921	1920
	cents	cents
New York	50.0	69.2
Chicago	47.5	65.7
Philadelphia	49.1	69.5
Boston	50.5	68.0
San Francisco	34.5	57.0

The receipts of butter at these markets were 8,251,208 lbs. as compared with 5,688,921 lbs. a year ago and 7,958,321 lbs. a week ago.

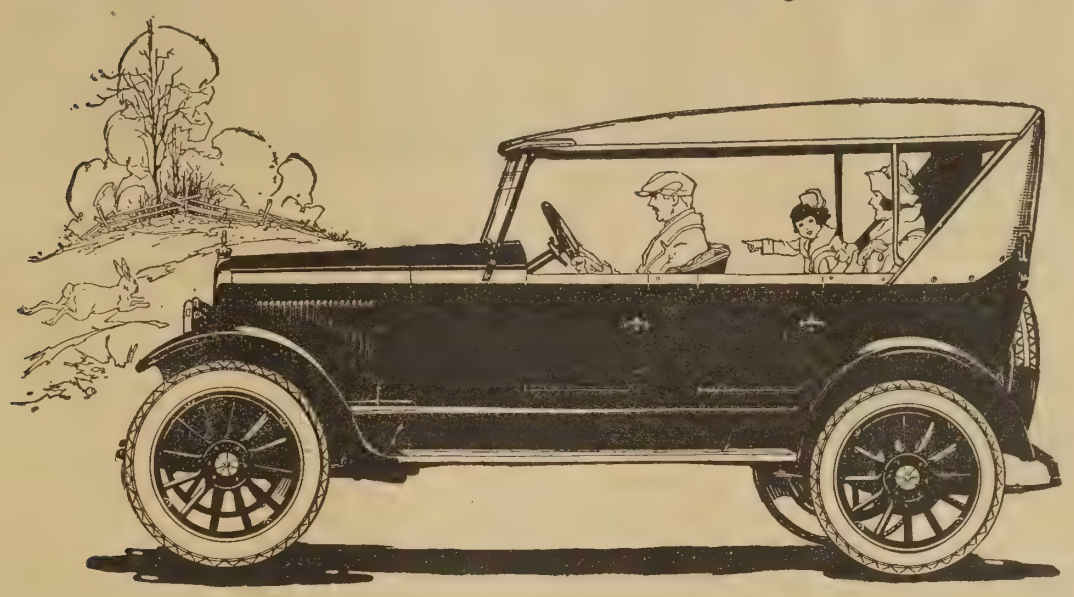
Milky Way Sells to Pabst

A transaction of more than common interest in the Holstein industry is the sale of the entire herd of the Milky Way Farms of Washington to the Pabst Stock Farm of Wisconsin.

Ninety-seven head of cattle were included in this herd which ranked second as a winner of prize money from the Holstein-Friesian Association of America in 1920.

Among the famous animals in this herd are Aurora Fobes Fayne De Kol 3rd, Lady Aggie Echo Hengerveld, Jewell Pontiac Segis, and Chimacum Spring Farm King Pontiac.



Jersey Fieldman in Louisiana

The Louisiana Jersey Breeders' Association has employed H. H. Haggard, who until recently has been the manager of A. J. Price's Jersey Farm as field secretary. Mr. Haggard fed and cared for Golden Bar's Foxy Lass, the champion producing dairy cow of the state, and placed seventeen other Jersey cows in the Register of Merit during the two years he worked with Dr. Price, which proves his ability to assist the Jersey breeders of the state in the development of their Jersey cattle. Mr. Haggard will spend his entire time with the Jersey breeders of the state and with their co-operation he can, and no doubt will, be of much service to them. His headquarters will be with the Dairy Department of the State University at Baton Rouge.

A pure-bred sire for the dairy herd can start an increase in milk production that continues through future generations.

BRISCOE

The Trustworthy Car

A Direct Statement—and a Challenge

The farmer has grown tired of the one-feature car—the car that plays up one point of satisfaction to the exclusion of all others. It is not safe to judge a motor-car merely by an unusual motor—a freak spring suspension—the winning of a race—a stunt or an unproved departure from standard design. A car should be good in everything.

Every feature of desirability must be taken into consideration. And that's why we make this positive statement,

The 1921 Briscoe

Is the Best Car Built Today

and we will prove it

What Combined Qualifications Make the Best Car

Let's put them down, and give each one the value to the average purchaser as shown by careful analysis—taking 100 points for all.

1. Reliability		
Engineering efficiency	6	
High-grade materials	7	
Accurate workmanship	6	
Balanced design	4	23
2. Power		
Ample power in relation to weight for speed, hill and road-ability, without costly excess	15	15
3. Economy of operation		
Gasoline and oil consumption	14	
Tire mileage	7	
Low cost of maintenance	6	27
4. Appearance and Convenience		
Style	11	
Comfort	11	
Ease of operation	5	27
5. Price		
Based, of course, on what you get per dollar	8	8
		100

Now take the 1921 Briscoe and measure it against perfection

1. Reliability

The 1921 Briscoe is a car light in weight, yet possessing the maximum of strength. This has meant the development of special steels; it meant the purchase of hundreds of thousands of dollars worth of machinery—much of it specially designed—so that we could make all the essential parts of the car in our own great plants. And it means now 100 per cent plus in sturdiness, strength and durability.

2. Power

The Briscoe has a remarkable reserve of power that carries it almost without effort wherever wheels will track. Hills that make most cars overheat and drop back to second speed are taken on high, with never a trace of motor-labor or boiling. Sand and mud have no terrors for the wonderful power-plant. You can readily prove this for yourself in a demonstration spin.

3. Economy of Operation

The Briscoe motor is world-famous for low fuel consumption. Owner's records of 20-25 miles to the gallon are the usual thing. The amount of unsprung weight has been so reduced and the car so perfectly balanced that tires seem almost everlasting. And the chassis is so simple and sturdy that few adjustments are necessary, and those are easily made.

4- Appearance and Convenience

It was Briscoe who originated the idea that beauty is not a matter of dollars and cents. Briscoe, too, first realized that comfort was just as essential in the low-priced car as in its expensive brother. That is why, today, you can ride all day in a Briscoe over country roads without feeling tired. And a child can operate it.

5. Price

That means not alone the actual number of dollars you pay, but what you get for each dollar. Briscoe today gives you more automobile value and more automobile satisfaction per dollar than any other car on the market, bar none.

We Challenge a Comparative Test

To any car, and all cars, we make this definite challenge. Taking the points of motor-car satisfaction indicated above, we will enter the 1921 Briscoe in a series of competitive tests, with the American Automobile Association or any other impartial motoring organization as the judge. The tests are to involve a thorough try-out of every car on every point, and each car is to be given a comparative rating by the judges on each test. Sounds fair, doesn't it?

And to every motor-car buyer we offer the same opportunity for the most thorough test. Go to the nearest Briscoe showroom and study the car; let the dealer demonstrate in any way you wish. Give him a chance to prove our statement—*the 1921 Briscoe is the best car built today*. And remember that the 1921 Briscoe price for open models is only $1285, f. o. b. factory. Most car per dollar and most satisfaction per dollar—that's Briscoe. *Free booklet mailed on request.*

BRISCOE MOTOR CORPORATION, JACKSON, MICHIGAN

REO
PASSENGER CARS

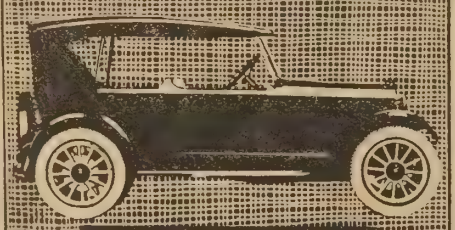
Standardiz

Time was, and not so long ago, when the farmer who owned a motor car was the exception—the envied of all his neighbors.

Today, the successful farmer and breeder who owns only one motor car, is the exception.

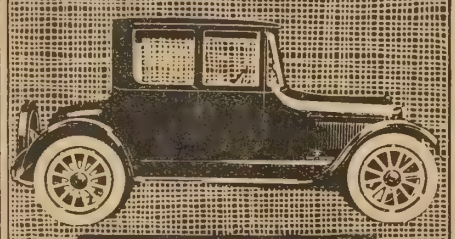
Two motor vehicles at least, are now essential on the well managed, efficiently operated farm.

A car for the family, of course.



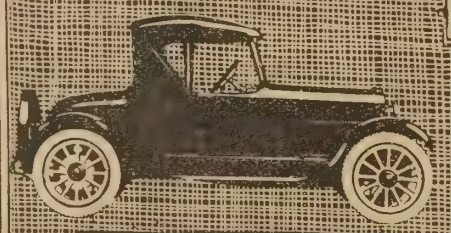
More frequently, a runabout or coupe for the busy head himself, and a five-passenger touring car or a sedan for "mother" and the rest.

And then, for all the farm hauling—all the road work—a Reo Speed Wagon.



You no longer think of using the slow team for road work—nor for the thousands of trips during the year transferring stock, tools, feed, implements, etcetera, from one part of the farm-plant to another.

That Speed Wagon must be a Reo—for "If it isn't a Reo it isn't a Speed Wagon."



Dairy farmers were the first to see and appreciate the superiority of this pneumatic-tired Speed Wagon for their special needs.

REO SPEED WAGON
TRADE MARK REG U.S. PAT OFF

Electric starter and lights make the early morning and late evening trips easy, while the speed and the sturdiness are the two qualities most needed in your work.

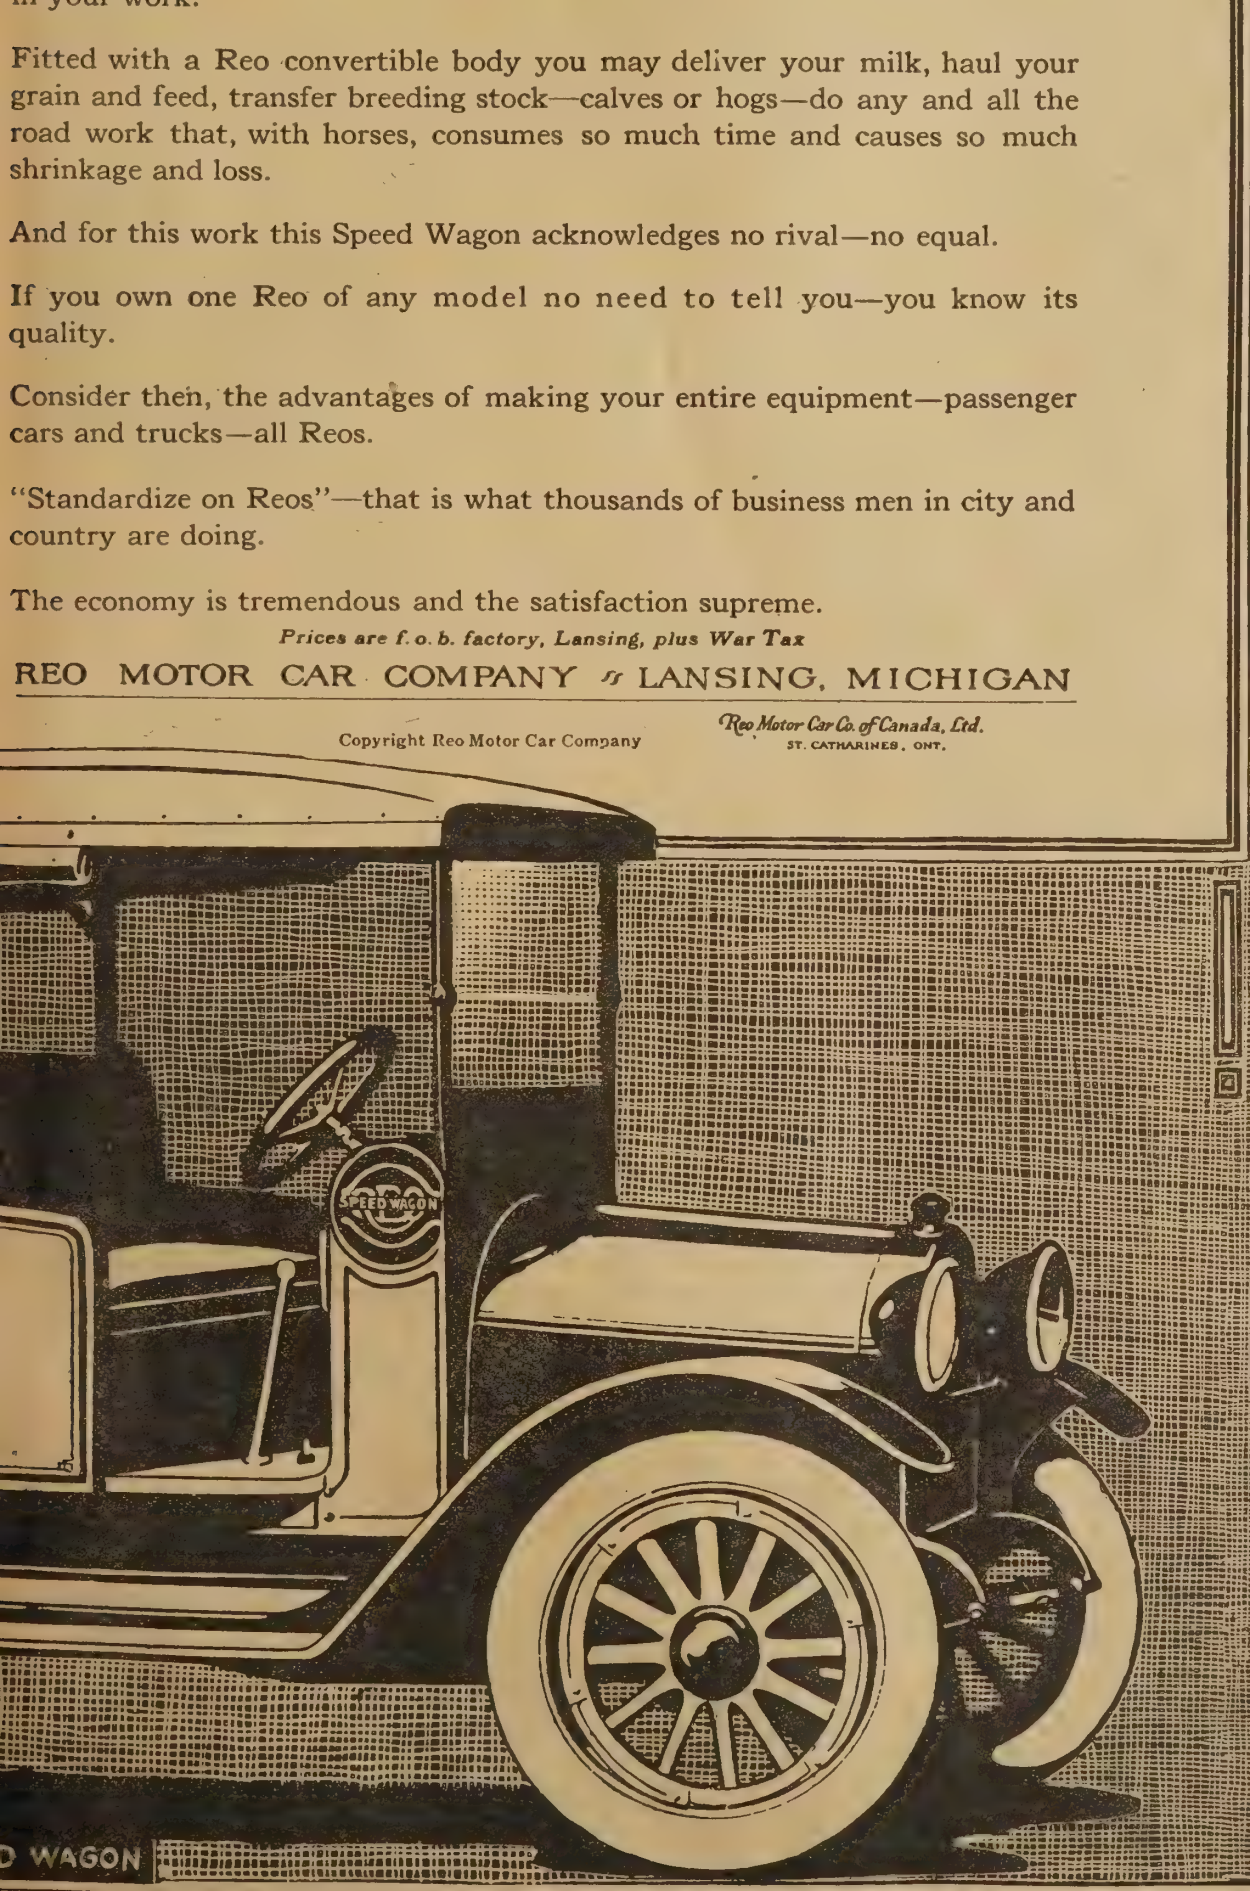
Fitted with a Reo convertible body you may deliver your milk, haul your grain and feed, transfer breeding stock—calves or hogs—do any and all the road work that, with horses, consumes so much time and causes so much shrinkage and loss.

And for this work this Speed Wagon acknowledges no rival—no equal.

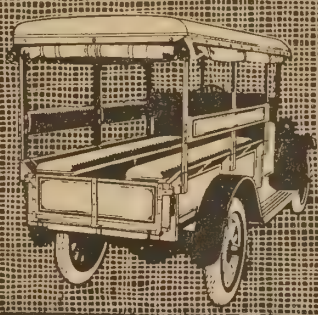
If you own one Reo of any model no need to tell you—you know its quality.

Consider then, the advantages of making your entire equipment—passenger cars and trucks—all Reos.

"Standardize on Reos"—that is what thousands of business men in city and country are doing.



The economy is tremendous and the satisfaction supreme.



Prices are f. o. b. factory, Lansing, plus War Tax

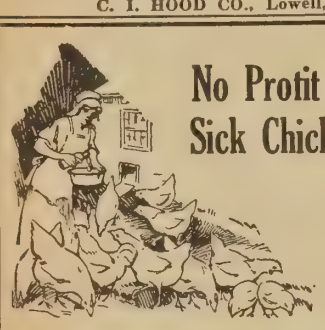
Barren Cows

Must Be Made to Breed or Your Dairy Business Will Be a Failure. They

Can Be Made to Breed

By the use of



Hood Farm Breeding Powder

We say this confidently because it has been used with such marvelous results by so many breeders. Every cow at Hood Farm is treated with the Breeding Powder, and we know that it does make barren cows and heifers breed; we know that it checks and prevents abortion; we know that it makes cows clean quickly, thereby saving us hundreds of dollars annually.

Order today, mentioning this paper.

Prices prepaid $1.15, $2.75 and $5.00. Flexible Injection Tube, by mail, 90c. Mammoth size Breeding Powder and Tube, prepaid, $5.75.

C. I. HOOD CO., Lowell, Mass.

No Profit In Sick Chickens

Keep Them Healthy

by spraying chicken houses and yards and purifying drinking water with

B-K Bacillus-Killer

Intelligent use of this powerful germicide will save little chicks from white diarrhoea and protect you against loss from gapes, pip, blackhead, cholera and the many other ailments common to poultry. All are caused by germ infections and are largely preventable.

No Poison — No Acid — No Oil

The Gallon Size is Most Economical for You. If your dealer can't supply you, write us. Be sure to ask for interesting instructive bulletin on chicken diseases.

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Hard Milkers

The inside of a cow's teat is open like a glove finger, and when not distended with milk its walls come together. Where the walls come close to form the tip of the teat there is an opening not much exceeding the thickness of the skin forming an entrance to the cavity of the teat. There is no large, strong sphincter muscle like a draw-string keeping this opening closed, neither is there a sphincter of that sort at the top of the teat where it connects with the milk sinus or reservoir or cistern, nor are there true sphincter muscles in the various lactiferous ducts which discharge into the cistern. The cow cannot willfully or purposely "hold up her milk" for the muscle fibers of the teat wall and udder are not under control of the will, nor is the "letting down" of milk under control of the cow. It is operated by the sympathetic nerve system, which is, however, intimately associated with the cerebro-spinal nerve system which operates the voluntary or motor nerves. The involuntary nerves and the muscles they supply may, however, be instantly affected by chill or shock and those influences often interfere with or impede milk secretion. Gentleness encourages milk secretion; roughness "shocks the nerves"; and the reflex influence impairs milk secretion. Muscle fibres may also become weakened so that leaking of milk occurs, or that may be due to an injury of the muscular tissues about the teat opening.

In some cows the openings of the teats are abnormally small and such cows are hard to milk. In others, the teats are flabby and weak in muscular tissues and milking then is easy or milk flows out between milkings. In most instances, however, hard milking is abnormal and has resulted from infection, injury, or growths within the opening of the teat or upon the lining membrane of the teat cavity, near the orifice, part way up or close to the udder. In some cases catarrhal discharge solidifies in the teat opening after the "drying off" process or an attack of garget and this substance has to be removed to make milking possible. It is not uncommon also to meet with a case where there is no orifice present at calving time and the attending surgeon has then to make an artificial orifice.

Warty growths are the commonest cause of partial closure (atresia) of the teat opening, or interference with milk flow. They may be removed if in the orifice or close to it, the veterinarian having special instruments for such work; but it rarely is safe or advisable to attempt by ordinary methods removal of growths that are high up in the teat or which hang into the teat cavity from the milk cistern. The right way to remedy such conditions is to cut through the teat wall when the cow is dry and that is a formidable operation only to be attempted by the trained surgeon. Sterilized dilators or expanders, properly used, often make a hard milker more easily milked, when the cause is a stricture at the tip of the teat, and teat plugs, or even a clean, fresh clove, may serve fairly well for the same purpose.

Congested Udder

I have a registered Jersey heifer one year old and by running with bull she was served to come in by next August. Please give me advice. Her udder is swelling up and is hard and she seems to have some pain in her udder. What can I do for her?

Algoma, Wis. J. J. D.

Many a heifer of the age mentioned has done fairly well, although bred so young. Let her run on grass and do not feed her heavily but keep bowels active. Twice daily, massage udder thoroughly and then rub in a mixture of 2 parts of fluid extract of poke root, 1 part of fluid extract of belladona leaves, and 5 parts of compound soap liniment.

Dysentery

I have a young cow that began scouring in January. I just about got her over it when she broke out with it again. Her hair seems to stand out straight all over her body so you can see her skin. She eats well enough and was tested last fall for tuberculosis.

Greene, Me. J. H. J.

It is to be suspected that the cow is afflicted with Johne's disease, which is incurable and contagious. Isolate her at once and cleanse, disinfect, and whitewash the stall she has occupied. Destroy or bury her feces as that spreads the disease. Have her examined by a qualified veterinarian and tell him what we have said. Meanwhile, try the effects of 20 drops of beechwood creosote and half an ounce of oil of eucalyptus given twice daily in 2 ounces of cottonseed or raw linseed oil and, if necessary, give it 3 times a day.

New Guernsey Champion Records

A number of Guernsey cows have lately completed splendid records. The following data concerns the records of four of these cows from as many different states.

Phebe D. of Maplelawn, a Guernsey almost twenty years of age, has completed a record of 7,467.2 lbs. milk, 416.7 lbs. fat. She is the oldest cow of the breed to complete an Advanced Register record, finishing at the age of 19 years and 7 months. She is owned by J. H. Seaman of New York.

A California Guernsey, Rose of the Rancho, owned by the Brant Rancho, finished a class F record of 14,731.2 lbs. milk, 707.27 lbs. fat. This gives her seventh place in this class. She ranks third in the class in milk production.

Honeymoon of Waldwic is a new champion in class EE. She is owned by Waldwic Farm of Wisconsin. Her record, recently completed, is 12,929 lbs. milk, 582.76 lbs. fat.

The first cow of the breed to complete an Advanced Register record in Idaho gained sixth place in class FF with a production of 9,583.4 lbs. milk, 562.37 lbs. fat. This cow is Edna of Mountain View owned by Leslie G. Perry.

For Perfect Grain Storage

WHEN you buy a metal crib--*any good* metal crib--you buy the best possible protection you can get for your corn and grain. Protection against losses from rats, weather, fire, lightning and mould.

But BUCKEYE gives you more than mere protection. It is a sturdy, everlasting crib that stores and cures your grain perfectly.

You draw interest on your corn and grain when you store it in a Buckeye crib or bin. For it comes out of this all-safe metal "bank" dry, sound, thoroughly cured. And you can sell it when the market is highest--at top-notch price.

There's no question about BUCKEYE superiority. Its wonderful new ventilatin gsystem gives you better ventilation than you can get in any other crib made.

Its exclusive steel rib construction assures permanent rigidity and strength. Cannot twist or buckle. Extremely easy to erect. A screwdriver and wrench are all the tools you need. Made in all sizes and styles--round or oblong and double-shed types. BUCKEYE Means Best! Write for our catalog.

100 Registered Guernseys

The two greatest Guernsey Consignment Sales ever held in adjoining counties in central Wisconsin will be conducted at Waupaca and Appleton, May 5th and 6th, respectively.

INDIVIDUALITY—The individuality of the cattle consigned is superb because the sale committees had practically a free hand in selecting the choicest animals from the best herds in these two well-known Guernsey communities.

FEDERAL HERDS—Over 65% of the animals to be sold are from Accredited Herds or herds under Federal Supervision. This means no chances will be taken in buying cattle from these two great sales.

Waupaca, Wis.

HOARDS DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

Filling the Corn Popper

[Continued]

"Well, we haven't much time tonight to talk about the details of the plans, son," he answered, at the same time glancing upward toward the clock which already had issued its musical warning that it was time for all decent farm folks to be in bed.

"Oh, let's finish the plans tonight, dad," Bruce anxiously urged, "We've got started now and it isn't going to take long when you get your head to working, dad," he flattered. "Let's see," he hurried on as he began to count those on whom he was certain they could depend. "Number one, of course, will be Jimmy Webb," he announced and he slyly glanced in the direction of his mother who recognized his first choice with an approving smile. Bruce was quick to note this. "I knew you would love Jimmy, mother. Every one does! He's a winner, he is, and the club wouldn't be complete without him. He's so full of good ideas, dad, that no matter how well we plan things, he'll have some valuable suggestions to make. All right, Jimmy's in for number one. Number two will have to be Bill—big Bill with the pug face," he reflected. "That makes a good beginning."

"How about having the girls, Bruce?" his mother interrupted. "I think it would be nice for them, too, if they want to come in."

"Oh, they'll want to come in on it," he hesitated, "but it kind a seems to me that they will be out of place with us boys," he boldly announced. "They're all right in their places and I'll bet Jimmy will agree with me that their place isn't trying to raise popcorn. Imagine Jimmy's sister, Jenny, in the club with all her bossy ways," he said in serious disgust. "Life would be unbearable and I'll bet Jimmy wouldn't consent to come in at all if she is to be a member. And we want Jimmy, so I am going to suggest, dad, that we do not allow any girls in this club. We'll keep out lots of trouble," and he laughed outright as he added, "we'll grow the popcorn and the girls can pop it for us and make the popcorn balls and if they want to form a corn popping club next winter, they can do it and we'll all keep out of it—but we will help them eat it."

And all the time that Bruce was orating upon the subject, his mother cast glances of satisfaction toward her worthy husband and undoubtedly the two were thinking the same thought—what a clever son our Bruce is. "Well, I was merely suggesting the girls, son," his mother commented, "but I see that I have met with but little favor. What do you think about it, dad?"

"Oh, maybe Bruce is right," he answered. "It doesn't make much difference though as far as I can see. What we want to do is to raise some popcorn in this neighborhood this summer and the more the merrier. But we'll see about that a little later after some other things have been decided."

"Well, let's see again," said Bruce, "who else we can bank upon, and he held up two fingers naming them Jimmy and Bill. "Yes, and there is Kenneth Sayre, that makes three, and Frank and Joe Bunce will make five and the Callenbach twins makes seven as he started to keep track of them on the other hand. We don't need to worry about not getting enough, dad, and I'll bet we will have a job keeping them out. Just wait 'til it gets noised around that you are interested in the boys and see what happens."

"We want all that we can get, son, all that will live up to the agreement of the plans we present. And now I am going to suggest that tomorrow morning you give Rex some exercise by riding 'round to see all the boys you think will be interested in our game and invite them to spend the evening with us at our home, and then we can complete our plans. The meeting place for the club can be right here," he continued, "and now I think we had better let the matter rest until tomorrow evening when we will try to complete our plans."

Bruce was out earlier than usual the following morning. The events of the past evening were uppermost in his mind as he groomed Rex so vigorously that even he became excited as he stepped nervously about in his stall to avoid his over enthusiastic master. And now and then he would enter a protest against what he thought was uncalled for kindness by nipping savagely at Bruce when he thought he was not being watched too closely. And once he really did pinch his young master on the arm which only made Bruce laugh as he continued the rubbing.

"Say, you little shaggy maned runt," he shouted at him. "Who do you think you are?" and he pushed him so hard against the other side of the stall that the horse in the next was startled. "Now you stay right there," he commanded as he resumed his work. "You've got a big job on your hands this morning, old boy, and you must look your best. Did I say on your hands, you little rascal?" he queried as he laughed aloud. "Guess I should have said your feet," and he stooped to lift one of the fore feet which he thought needed some trimming.

"Well, it does need looking after, young man," he said, "but it will have to do for this trip, because mother is calling me to breakfast, so you had better hurry up and eat yours, old fellow," he ordered, "for we'll soon be on our way."

Following a hearty breakfast which he hurriedly consumed with an appetite that only a fourteen-year-old boy knows, he was off on his mission. It would be difficult to say which was in better spirits, Bruce or Rex. There had been a light frost that night which left the morning air crisp and clear. Rex champed at his bit as he stood at the back door where Bruce had left him while he went in to say good-bye to his father and mother.

"Ask them all," were his father's last words as his son proceeded to mount Rex, who danced about more than usual in his eagerness to be off. "I'll do that, dad," he shouted back as the impatient pony dashed out of the yard. Bruce headed him straight for Jimmy Webb's home. "That's where we'll go first, Rex, and see how excited we can make Jimmy over our new stunt." Rex seemed to know where he was going and why shouldn't he, for hadn't he spent about as many hours at Jimmy's as he had at home! And what usually meant about a half hour's ride was made in fifteen minutes, according to Bruce's watch.

"Chicks hain't out yet," Jimmy greeted him at the door while he gulped down the last mouthful of breakfast.

"Well, what of it?" Bruce laughed, dismounting from his pony. "I didn't expect that they were."

"What's the matter, then?" asked Jimmy. "Some one sick at your home?"

"I should say not, are they, Rex," as he affectionately stroked the pony's mane. "We've got a new scheme at our house, Jimmy," he started. And he related in hurried breath enough of the conversation he had had with his father about the popcorn club to make Jimmy understand why he was there so early.

"Do you mean to say, Boo, that your dad has got the club fever, too?" he seriously inquired.

"That's what, at least that's what I think from what he said last night. And mother's got it too," he laughed. "They're just as excited about it as I am and just think of it, dad is going to be our leader in this club! All we've got to do is to support him and each of us do our part and he wants every one who will become a member to come over to our house tonight to talk over the plans. I think it will be lots of fun to do this and it will give us all a chance to have a little business of our own."

"Well, count me in for one, old kid," said Jimmy, "and I'll be Johnny on the spot tonight. I've raised popcorn before but I am willing to learn more about the job and I am sure that your dad has something to teach us or he wouldn't be interested. How many are you going to try to get?" he asked.

"All we can, Jimmy, and I don't believe we will have any trouble in getting enough, do you?"

"I should say not," he replied. "They'll all come in if for no other reason than to get a chance to come to your fine home. You know that will be a treat in itself for all of us and especially for the ones who have never been there before."

"Well, I'm glad you like the idea, Jimmy, and we'll count on you for one of the ring leaders. Maybe you can be the biggest popcorn grower among the bunch, anyway we'll all know at the start that you are the biggest eater," and at that he wheeled Rex about in his tracks and was off to see big Bill Horne.

Bill needed little coaxing. He had little initiative and inventiveness of mind but he was always a good follower. "Sure I'll be in," he assured Bruce. It's a good scheme and I don't see why we haven't been doing some of these things before this."

"Neither do I," Bruce returned "But now we have the chance and we better make the best of it."

"Who are you all going to have in the club?" Bill asked.

"All we can get," replied Bruce.

"Well, there's only two fellows that I'd like kept out," he sullenly suggested.

"Who are they?' Bruce quickly asked.

"Oh, them Callenbach twins! They make me tired every time I see them and they're so mighty hard to get along with."

The truth of the matter was that these same twins had at one time given Bill a licking for bullying them more than it is possible for any red blooded boy to endure. It was a bitter pill for big Bill and he swore at the time that he would get them some day for this, but in his own mind he knew that for him there was danger wherever the twins were.

"Well, we are going to ask them Bill," was Bruce's answer. They're mighty good little kids and their dad works them more than is good for them and maybe this will add a little pleasure to their lives. And it would be foolish for you not to come in. It will be a good chance to make up with them and, besides, if you stay out, every one will know the reason. You got that licking because you deserved it, Bill. You were simply taking advantage of them, one at a time, but they were clever enough to combine their forces before they attacked you and they'll do it again if they have to. So you'd better be a good fellow and make up with them and now's your chance."

"Oh, I'm coming in all right, but I don't think that I'll have anything to do with them though."

"Suit yourself about that, Bill, that's your own business and I'm glad that you will be one of us."

Bruce had made the rounds by eleven o'clock and he had been more than successful for not one of the boys he visited had said he wouldn't be a member. In fact, in more than one case, he had to be rather diplomatic in turning down the requests that came from some of the younger girls of some of the families to allow them to join too.

He was back home by noon. His success was related to his parents at

HENRY GABRIEL OF WISCONSIN AND HIS 1919 GARDEN EXHIBIT

the dinner table and was received with much enthusiasm. "That's splendid," remarked his mother, and his father added that he guessed he had taken on more work than he had anticipated.

That evening the young enthusiasts arrived in numbers that even Bruce couldn't explain, and as he afterward laughed to his father and mother. "it didn't take long for the news to travel." Of course, the whole truth was just this. This particular community was envious of the Carters and it had never had the pleasure of an acquaintance with them in a way that country folks like. To have the Carter home thrown open to the boys of the neighborhood was indeed quite a surprise so it was not unlikely that among those present there should be those to whom a formal invitation had not been extended by Bruce that morning.

The large cheery living room of the Carter home was completely filled with the arrival of the last ones and it is not going too far to say that never before had its walls had pent up within them so much of what life really is. To most of the boys it was indeed a rare treat to be entertained in so gorgeous a home, and no doubt more than one heart felt out of place as the boys' eyes gazed in wonder at the beautiful furnishings with which the room was decorated. But to Bruce there was something more wonderful. Try as hard as he might he found it difficult to engage in conversation with the boys, not even with his best friend, Jimmy. He could not keep his eyes from following his mother as she passed gracefully about among the boys, greeting them in a way that held his attention almost completely. It seemed to suddenly dawn upon him that his mother was beautiful as she mothered the household full of boys and he wondered to see all this coming from her who had always evinced a dislike for all of his friends. In fact, Bruce was not exactly himself, until he had called his mother from the room and whispered in her ear, "Mother, I never have seen you look so pretty before. You are simply lovely to these boys," and he reached up to plant a kiss on her glowing cheek.

For a moment the tears came to her eyes, and she said in return, "I see now what I have been missing all these years that I have lived among these people, Bruce. I see now what life really is and these boys are genuine. I wish that I could be the mother of them all and that each could have the benefits of our fine home. They are worth it, my boy, and from now on your mother will do all she can to help to bring sunshine into their lives, and remember, son, if at any time my boy feels that his mother is not giving him enough attention, he must remember that she is sharing herself with his friends. And when they returned to the room, his father was explaining to the boys the purpose of the meeting. He was saying to them, "and we want to go in to stick to the finish. Every one who signs up tonight to be a member of this club must firmly resolve to do his best and to work according to what all the members think is the best. I shall always be on hand to help you and from time to time we will have meetings like this one to talk over things of interest to us all and of course I shall want to visit you all some time during the summer to see how well you are growing your crop. We don't want anything like a constitution in this club. I think our word to be a member is enough to bind us all to our agreement which is simply this:

"Each member of the club must agree to grow a quarter of an acre of Baby White Rice popcorn. If any one wants to grow more he can, but we think that a quarter of an acre will furnish plenty of popcorn for each home this winter and maybe some of you will have enough to sell. I am going to furnish the seed to each of you free of charge to be sure that you are all growing this particular kind, because it is the best. How does this strike you, boys, so far as we have gone?" he asked.

"Fine," a number of the less bashful ones answered.

"What will be the name of our club?" inquired Jimmy.

"Just what we want to talk about now," answered Mr. Carter. "A club that is going to do as well as we are, must be well named," he smiled to them. "Are there any suggestions that any of you wish to make?"

"I was just thinking when I asked the question, that if we called ourselves 'The Poppers', we'd have a pretty good name," Jimmy volunteered. "How do you all like it?" he asked.

"Very good name, Jimmy," commented Mr. Carter. "And it also suggests that we will all have to hustle to do our best. Yes, I think it will be a very good name for us. How many would like that for a club name?" he asked. To which the majority of hands indicated that they agreed. "It is agreed then that we will call ourselves 'The Poppers'," he concluded, "and now that we have taken the first step and are organized, we will wait for the next meeting to learn our first lesson in popcorn growing."

There was a shuffle of feet as the boys arose to leave. But just at that moment, Mrs. Carter appeared in the doorway leading to the kitchen and said, "the meeting is not over yet, boys, I have something to say," and as she stepped aside, Bruce entered carrying a tray heavily loaded with dishes of ice cream and plates of cookies. While this greeting seemed to be highly pleasing to all as they sank back into their chairs, there was but one in the crowd who had the courage to express it, and that was the smaller Callenbach twin, Jake.

"Gee, I didn't want to go home, yet," he said as he walked forward to meet Bruce and helping himself to the biggest dish he could spy. "I'd like to stay here all the time," he added as he greedily proceeded to make away with what he had before him.

"Well, we'd be glad to have you, Jake," smiled Mrs. Carter.

"But I guess I'd get an awful licking from pa," he volunteered, which made all the boys stop and laugh. "He didn't want Pete and me to come tonight, because he said that you was all stuck up and we wouldn't be good enough. But we cried awhile and then he said we could come this time.

"The big boob," whispered Bill Horne to his neighbor. "What will she think of him!" But it was plainly evident what Mrs. Carter thought of him, for after filling his dish again, she sat down beside him to add to his pleasures by her motherly presence.

Junior Letters

Hoard's Dairyman Juniors:—I can scarcely wait until our Hoard's Dairyman comes to see what some of the juniors have to say.

My brother and I have joined a pig club. We will get our pigs soon. We are going to do our best to win the prizes. First prizes as far as I have heard yet are $10, second $8, third $2.

I would like to learn improved ways on raising hogs. They are urging a calf club, too. If they begin one father wants me to join and raise a fine cow.

I believe every junior should try and learn all he can, so I will do my best. I like to raise and see pigs and calves grow. If any junior belongs to a calf club I wish he would tell me how he raises them and the kind and what he feeds them.

I am 14 years of age and in the 8th grade in school. I wish the juniors good luck in the future and wish every junior would write me letters. I will answer. Address: Friedens, Pa. Wayne McCarney.

Hoard's Dairyman Juniors:—I have not written for quite a while as I have been busy working. I am going to have a garden this year and try to raise something to take to the fair. I have some queer seeds known as "the Chinese Yard Long Beans", also the "French Carrot" which weighs from 4 to 5 lbs. apiece. If they grow to be that large I shall take them to the fair this year.

My calves are doing fine. I feed them hay, grain, a little ensilage, and they are outside every day when it is not raining. Our cows are fed hay, grain, ensilage, and kale.

I have missed only one-half day of school. I ride my pony every day.

My mother has eleven little chickens and she has four hens set. One hen is mine and she has fifteen eggs. I will get half of the chickens and the hen.

We have three turkey hens and a gobbler. My mother is going to raise a lot of turkeys this year I think.

My father has moved our granary and is going to make a garage out of it.

I wish some of the juniors would write to me. My address is R. R. No. 2, Box 33, Gaston, Oregon. Robert L. Gibson, Jr.

Hoard's Dairyman Juniors:—I am eleven years old and in the seventh grade in school. I live on a fifty-acre farm. We have ten head of Guernsey cattle and fifteen sheep. Four of the sheep have twin lambs. The mother of one pair of lambs died so we are feeding them on a bottle. Their names are Topsy and Turvey. I have a pure-bred Guernsey heifer in the calf club. She won first prize at the fair this year. We took three of our sheep to the fair and they won the first prizes. I belong to the calf club of Chenango County. Harry L. Case is the leader. We have had an open winter but it has been very cold. I have a brother fifteen years old. His name is Alton and he is in the eighth grade. I wish some of the juniors would write to me. My address is R. F. D. No. 2, Norwich, N. Y.

Mildred Cook.

Hoard's Dairyman Juniors:—I have been a junior for a good many years and like to hear how some of the juniors are getting along in the dairy business. We have at present about thirty-five head of Holstein-Friesian cattle. I am also very much interested in our herd, because I have one cow and a heifer calf of my own. Her name is Majascala Lady Small Hopes. She's a nice, straight heifer, and perfect in every respect. She was bred April 27, 1920, to Empire Segis owned by H. A. Moyer of New York. On January 26th, 1921, she dropped a heifer calf, as nice a calf as can be found in many a herd. I am raising some calves again this year and like to see them when they are healthy and grow. I like Holstein cattle, therefore I try to make a success of them. I hope some of the juniors will write. My address is Box 242, Macungie, Pa.

Timothy H. Gehman.

Hoard's Dairyman Juniors:—We are just beginning to set eggs for hatching. We have set two hens. We have the R. C. Rhode Island Reds and White Wyandottes and our 70 hens lay from 40 to 50 eggs per day.

We have two old sows and 4 gilts; they are the big type Poland-Chinas. Thornwood's Big Jumbo and Thornwood's Big Leader are the two boars that head the herd. One of the gilts is to farrow in about 4 days and she is bred to Thornwood's Big Leader, one of the biggest boars for his age in the state. Thornwood's Big Jumbo is about 2 years old and weighs about 900 lbs. Our sows weigh from 400 to 650 lbs.

We have Guernsey cattle. At present we have 8 pure-breds, 1 bull, 4 cows, 3 calves, and the rest are grades.

Wisconsin. Henry Schultz.

Pooling Starts May 1st

Dairymen's League Concludes its Program and Says "Over the Top"

The time which dairymen have been looking forward to and working toward for many months has at last arrived. The Executive Committee of the Dairymen's League Co-operative Association at a meeting on April 12, voted to pool on May first the milk of all those members who had signed the co-operative contracts. This action of the League's Executive Committee will have to be confirmed by the Board of Directors which will meet on April 22, but, inasmuch as the Co-operative Association will have more than its 50,000 contracts on May 1st, there is no doubt that the directors will confirm the decision of their executive committee. No other decision that has ever been made in the dairy industry is of such far reaching importance as this decision to pool, and the news will be more than welcome to those thousands of farmers who have been without a regular market for their milk since October 1st.

The Dairymen's League Co-operative Association is busily engaged in hiring the necessary help and installing accounting and other equipment for the proper handling and safeguarding of the proceeds of its members' milk.

It is expected that the final decision to pool will have an immediate effect upon thousands of men who have hesitated as to whether or not they should sign the Dairymen's League Co-operative contract. Many have been waiting to see whether the campaign to get 50,000 subscribers to the contract could be brought to a successful close, and now, assured that the pooling is actually to begin on a definite date, these men will hasten to get in line with their neighbors and fellow dairymen throughout League territory in order to be assured of a regular market for their product.—Dairymen League News

Chance For Stock Man With $20,000 Cash

360 A. Finely Improved Stock and Dairy Farm in Central Michigan; prosperous, thickly settled neighborhood; near city with high school and state normal school; buildings alone worth $40,000; rich clay-loam soil. 240 A. in cultivation and meadow, balance blue grass pasture. Reliable men say this farm will make $35,000 per year clear profit as a stock breeding and dairy business. Trucks from two milk factories pass the farm daily. Worth $200 per acre; will sacrifice for $169. Will sell half interest to good stock and dairy man with $20,000 cash and give easy terms on balance. Will invest half the money needed to stock and equip the farm. Will make reasonable terms on entire farm. Address

780-Acre Washington Dairy Ranch For Sale

15 miles from Portland with Boat-Landing and Railroad Station on the place. 640 acres on bottom—140 acres on upland, all deep sandy loam which raises immense crops. 150 acres in cultivation and seeded to alfalfa, clover, grain and corn. Balance is mostly some of that great pasture, of which Mr. Aitken, the Holstein president, after his coast trip said, "Will bring, in connection with the mild climate, greater results in dairying and at a lower cost of production than east of the mountains."

THERE ARE TWO SETS OF BUILDINGS ON THIS PLACE, two barns for 75 and 50 cows each, 3 silos, etc.

THIS PLACE WOULD MAKE A FINE HOME AND PAYING INVESTMENT for someone on account of the fine view, the excellent soil, the mild climate, the good market, the very low price and would be especially adapted for breeding Registered Stock. We would either sell 500 acres of the bottom for $35,000 or the whole for $65,000.

Owners, CUENI & GASSER, R. 2, Box 49, Ridgefield, Washington

26 Registered Holsteins — 10 Grades—TO BE SOLD APRIL 30TH

The pure-breds include 17 females of milking age and 5 heifer calves. Among the grades are 8 of milking age and 2 bred heifers. Sold subject to a 60-day retest. Write for further information.

FRED GOLDBERG, Owner **East Palestine, Ohio**
L. M. FOX, Herdsman

British Condensed Milk Standards

HOARD'S DAIRYMAN:—England is not only the biggest consumer of condensed milk, but she also imports the largest quantity of this produce. Consequently the new regulations governing the sale of the product are of the greatest importance to those interested in the condensed milk industry. The most important provisions are as follows:

"No person shall sell or expose for sale or deposit in any place for the purpose of sale or dispatch or deliver to any purchaser, broker, or agent, any condensed milk intended for human consumption unless the condensed milk is of a composition complying with some one of the standards set forth in the first schedule to these regulations and is contained in a receptacle which is labeled in the manner prescribed in the second schedule to these regulations.

"When a sample of condensed milk has been taken in pursuance of the provisions of these regulations, the local authority or the medical officer of health, pending the receipt of a report on the result of the chemical examination of the sample delivered to the public analyst, may by notice in writing, addressed to the owner of the condensed milk or the occupier of the premises where it is deposited, require that for a period not exceeding ten days the consignment of condensed milk from which the sample has been taken shall not be removed from the place where it has been deposited without the consent in writing of the local authority or the medical officer of health.

"Where a sample of condensed milk does not comply with the required standards, the local authority shall not consent to the removal of the condensed milk unless it is satisfied either that the requirements of these regulations have been complied with, or that it will be exported or disposed of for manufacturing purposes or that it will not be used for human consumption.

"The import (otherwise than for re-export for use for manufacturing purposes) of foreign condensed milk intended for human consumption is forbidden, unless the same satisfies the demands of the standards and labels."

All condensed milk must comply with some one of the following minimum standards:

Type of condensed milk	Milk fat per cent	Total solids per cent
Full cream, unsweetened	7.8	26.5
Full cream, sweetened	9.0	30.0
Skimmilk, unsweetened		20.0
Skimmilk, sweetened		26.0

Every receptacle containing condensed milk shall bear a label upon which is printed such one of the following declarations as may be applicable or such other declaration substantially to the like effect as may be allowed by the Minister:

"Condensed Full Cream Milk Sweetened. About — per cent of the contents of this receptacle consists of added sugar.

"The contents of this receptacle are equivalent to — pints of fresh milk with added sugar. For use in the place of fresh milk with added sugar. This condensed milk should be mixed with — times the quantity of water (i. e. — spoonfuls of condensed milk to — spoonfuls of water)."

The labels for the other descriptions are nearly the same; in the case of skimmed milk, sweetened or unsweetened, there must be added: "Unsuitable for infant feeding." The prescribed declaration shall be printed on a label in dark black type upon a light colored ground within printed lines, forming a rectangular parallelogram in letters not less than one-sixteenth of an inch in height, and no matter other than the prescribed declaration shall be printed within such parallelogram. If there is attached to the receptacle a label bearing the name trade-mark or design representing the brand of the condensed milk, the prescribed declaration shall be printed as part of such label. There shall not be placed on any receptacle containing condensed milk any name, statement, design, or representation, in words or symbols, which is false or misleading. A person who neglects these regulations shall be liable to a penalty not exceeding £100, and, in the case of a continuing offense, to a further penalty not exceeding £50 for every day during which the offense continues.

It seems to us, that these regulations will turn out to be of the greatest importance for the bona fide condensed milk trade. The United States is especially interested in this matter as it delivered nearly 91 per cent of the total import of condensed milk in the United Kingdom.

Holland. N. H. BLINK.

Soybeans for Hay

Soybeans for emergency hay purposes have grown rapidly in favor during the last 10 years, especially among those who are farming the sandier soils where clover and alfalfa are not likely to do so well. Unlike millets and Sudan grass, both relatively low in protein, soy bean hay is very high in digestible protein, being about equal to alfalfa hay. Although it is a little difficult to cure, the palatability and high feeding value of this hay make it a very desirable forage.

Wisconsin varieties, such as the Ito San, Medium Early Black, and Medium Early Green, are among the best. They can be cut earlier at a time when the weather is better for hay making. Seeding broadcast or drilling in at the rate of 4 or 5 pecks an acre is a good method when growing soybeans for hay, because the plants are finer stemmed when grown under these conditions. However, they may also be drilled in cultivated rows. By using a special soy bean plate and setting the wheels of the corn planter 44 inches apart, rows 22 inches wide can be made by straddling every other row. From 20 to 30 pounds of seed an acre are required for row plantings. Everything considered, the first method is preferable. Seeding should be delayed until about corn planting or a week or so later.

Soy beans make the best hay if cut when the blossoms are fading and the pods are forming. In order to save the leaves, the most valuable part of the crop, the plants should only be allowed to wilt well in the swath. Then they should be put up in small cocks and left to cure, which usually takes about a week in good hay-making weather. Although peas and oats or Sudan grass may give larger yields, the high protein content of soy bean hay is a big advantage. The soy bean, being a legume, has the special advantage of enriching soil with nitrogen, providing the seed has been inoculated.—Wisconsin Special Circular.

The Farmer and His Friends

(Continued from page 579)

as evil. But do we recognize that good is also contagious? Good health is contagious. Success is contagious. Joy and happiness are contagious. Do I need to explain? You will understand this better as you think about it.

We are social beings and have to mingle together in order to be comfortable and happy. And since, if you have enough character to deserve the name of man, you have an influence for good or evil, there arises before you a responsibility. Probably there are at least a few lives upon whom you can exert the deciding influence between good and bad, between success and failure. It is one of the finest things in life for a man to rise up out of his own cares, his private duties, out of his own failure and gloom or out of his own happiness and lend a helping hand to the man within his reach who needs him.

There is no general rule regarding the depth of planting, as different kinds of vegetables and different soils necessitate different practices. The smaller the seeds the shallower the covering should be as a rule. In heavy soils the covering should be lighter than in light soils.

JAMISON BROS., Appleton, Wis.

Anton's Starlight of Prospect 67294

SIRE—ANTON'S KING CONFIDENCE NO. 43517
DAM—ARVILLA OF PROSPECT 71589

This young bull is one of the big boned type. He is well filled out and his quality is excellent. He is the right kind of a sire to build up a herd and to instill some of the best blood of the breed into their veins.

His sire is Anton's King Confidence 43517, our present senior herd sire, who traces six times to May Rose 2nd.

The dam of Starlight is Arvilla of Prospect A. R. She is one of our grand old cows and has a record of 335.91 lbs. of butterfat in a year as a two-year-old on twice a day milking and regular herd rations.

This bull is an excellent buy for the man in search of an A-1 at a reasonable price.

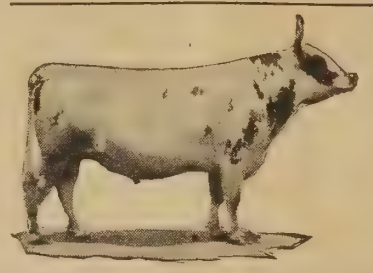
MIDDLESEX MEADOWS FARM

OFFERS

Two outstanding AYRSHIRE BULL CALVES for sale for immediate shipment

No. 1—MIDDLESEX WHITE CHANCELLOR 25273, born September 17th, 1920.
Sire—Cavalier's Netherall Chancellor 21216, who sired the winning bull calf at this year's National Dairy Show.
Dam—White Heather of Highland 42752, who stood 2nd in the aged cow class at the same show (this year's National) and who has two good Roll of Honor records.

No. 2—MIDDLESEX MANCHESTER, born March 10th, 1921.
Sire—Auchenbrain Toreador (Imp.) 24761, record priced bull of the breed and Grand Champion at Maryland, New York, Connecticut, and New Jersey State Fairs this year.
Dam—Bida Clinton 31489, who has three A. R. records that average 11,000 lbs. of milk, 453 lbs. of fat, 4.17%; and whose two-year-old daughters will have records of over 10,000 lbs. of better than 4.00%.



Both bulls have excellent individuality, and are fit to go into any show ring and hold their own. They should develop into extra good herd sires. Prices reasonable—we KNOW you can't get as good as these two for any less money elsewhere.

A Quality Sale

De Pere, Wisconsin

Monday, May 9, 1921

84 HEAD

The Brown County Holstein Ass'n

plans a rare treat for Holstein enthusiasts on the above named date. The word "quality" has been used freely in connection with sales but we want every reader of this ad to be thoroughly convinced that the word applies to this sale in its fullest significance. Not only will it be a quality sale but a sale of above board and absolutely square dealing. Have you heard of many one-day County sales which boasted of 20 A. R. O. cows including a 28½-lb. four-year-old daughter of a 29-lb. cow bred to a 37-lb. bull who is by a good 34-lb. sire? Another good cow that is bred to a bull whose dam and sire's dam average 1,329 lbs. for yearly butter production. Have you attended many one-day sales of this character that could include in their catalog 35 daughters of A. R. O. cows? We think not. Brown County has done it. On top of this Brown County feels proud to announce that 45 of her cows in the sale are bred to 30-lb. bulls.

THE BULL OFFERINGS are splendid, including as they do a son of the Mighty Monarchy out of a 37-lb. dam; a son of King Segis Pontiac Superior out of a granddaughter of King Segis Pontiac Count; a grandson of 37th's through Sir Pietertje Ormsby Piebe whose six nearest dams average over 31 lbs. in 7 days and whose seven dams average 831.85 lbs. for yearly butter production—his dam a good 20-lb. three-year-old daughter of Johanna King Segis. Five other good bulls will be sold whose dams have records above 24 lbs.

REMEMBER that Brown County boasts, and justly so, of the health of her herds; that the cattle in this sale will be sold under the Wisconsin Federation rules, which includes the 60-day retest.

COME TO DE PERE ON MAY 9TH and participate in the benefits that this sale holds out to you, by making selections from as choice an assemblage of cattle as Wisconsin can offer you.

Clark County Quality Holstein Sale

Owen, Wisconsin, May 3rd, 1921

60 Head Selected Pure-bred Holsteins

The Cream of Clark County's Best Herds

These cattle were selected by the three officers of the Clark County Holstein Breeders' Association and nothing but two or three head of the best of each herd were permitted to be entered.

The quality and type of these animals is as good as any found in any show ring. If you want to buy come and see Clark County's best animals. To show you, most of the cows are bred to the following reference sires:

1—**King Korndyke Haidee Ormsby,** an $8,500.00 bull. His 2 nearest dams average butter, 365 days, 1,137.61 lbs.; milk, 23,860.85 lbs.; butter, 7 days, 32.58 lbs.; butter, 30 days, 135.45 lbs.

2—**King Hendricke of Piebe** a $5,000.00 sire, a son of Piebe Laura Ollie Homestead King out of a daughter of King Segis Pontiac Count, butter, 365 days, 966 lbs.; butter, 7 days, 32.9 lbs. as a 3-year-old.

3—**Producer**—His two nearest dams average **1,191 in one year; his four** nearest dams 30.26 in 7 days.

4—**Sir Bess Ormsby Starlight**—a son of 37th whose three nearest dams average 1,048.

We have the best bred 6-month-old heifers at this sale ever dropped in Clark County, sired by Reference Sire No. 1.

Also we have two of the best bred bull calves ever born in Clark County.

No. 1 sired by Reference Sire No. 1, out of the full sister to Prospect Johanna Posch, Champion 4-year-old butter cow in the state. Dam is making over 900 lbs. butter this year.

No. 2 sired by King Pietertje Ormsby Piebe, show bull winning 4th at Waterloo Cattle Congress, also at Chicago, whose 4 nearest dams average over 1,000 lbs. Dam of calf a 2-year-old daughter of Duke Pietertje Korndyke Ormsby 8th, whose two nearest dams average 1,056 lbs. This heifer is making a fine yearly record. Calf is almost perfect individual.

Also a number of heifers whose dams milked 100 lbs. milk per day on official test, records 20 to 30 lbs. of butter.

Most of the cows with records from 20 to 30 lbs. showing fine breeding all through pedigree, bred to Reference Sires. All animals tuberculin tested, sold subject to 60-day retest. This is Clark County's first quality sale. You can close your eyes and bid and get every dollar's worth you pay for.

2nd Spring Sale

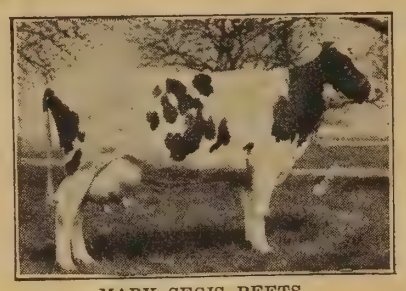
May 10-11, Fond du Lac, Wis.

150 Head Pure-bred Holsteins

All animals over 6 mos. tuberculin tested and a 60-day guarantee given

This sale will include the dispersal of the good herd of H. L. Pieper, Brownsville, Wis., with cows with records up to 24 lbs. This herd has been built up with the aim of type and production.

We will sell 50 cows, many close springers, bred to bulls with records up to 37 lbs.



We will sell heifers of all ages. Here is a good opportunity to buy calf club calves and yearling heifers. These heifers are out of dams with records up to 25 lbs.

We will sell 25 bulls whose dams have records up to 25 lbs. and 657 lbs. yearly.

Now is the time to start that Pure-bred Herd

S. H. Bird, Sales Mgr., So. Byron, Wis.

Her Son Is For Sale

MARY SEGIS BEETS

She a 32-lb. 1000-lb. Cow

He is just past a year old, well grown and a splendid individual. His dam, Mary Segis Beets, has twice made over 31 lbs. and has just finished a 1000-lb. yearly record. His sire is King Pontiac Artis Sadie Vale, a 34-lb. son of the great K. K. S. V. Several of his daughters are doing very well on yearly test in our herd.

He'll suit you for a herd sire. Write us about him today or come and see him.

Remember the Holstein Banquet 6 P. M., May 4th

A five-year-old cow, holder of three Ohio State records for milk and butter.

Two granddaughters of Early Dawn Peep 2d, who has 33.32 lbs. butter, 634.1 lbs. milk in 7 days; 1,287.73 lbs. butter, 26,204.0 lbs. milk in 365 days. One an 18-lb. 2-year-old, the other a 16-lb. two-year-old.

A ten months bull calf from the heart of the Ona Family. His five nearest dams average 1,150 lbs. butter, 25,000 lbs. milk.

A show calf, son of a former world record cow, with 1,198.3 lbs. butter, 28,801 lbs. milk in 365 days.

Four yearling heifers sired by sons of Lindale Bonnie Pauline, Ohio's only 30,000-lb. cow and all out of tested dams.

A son of Lindale Bonnie Korndyke, with 914.16 lbs. butter, 23,038.3 lbs. milk. His three nearest dams average 24,000 lbs. milk, 1,000 lbs. butter in 365 days. Three daughters of Fairview Pontiac Beets Korndyke, sire of 5 cows with over 30 lbs.

A daughter of Nina May De Kol of Cooley Farms, 1,047 lbs. butter, 23,221 lbs. milk, as 3-year-old.

A daughter and granddaughter of Aroc Edna Pietertje, 1,130.21 lbs. butter, 26,529 lbs. milk in 365 days.

Two 25-lb. sisters. Splendid cows of the best type that promise well on semi-official test.

An excellent 3-year-old son of K. P. Princess Bettina, 31.09 lbs. butter, 625.7 lbs. milk in 7 days, 1,027 lbs. butter from 21,641 lbs. milk in 305 days as a 4-year-old. She is one of the good daughters of King of the Pontiacs.

A show cow with an 18-lb. 2-year-old record. She is from a 29-lb. daughter of King Hengerveld Model Fayne.

We could say something good about every consignment if space permitted. HERE'S THE POINT: you buy in this sale animals that breeders would not price in their barns.

Facts about Ohio Holsteins

Ohio has more 1000-lb. cows, more 1100-lb. cows, and more 1200-lb. cows than any other state.

Ohio has three 1300-lb. cows. This is equaled only by two other states.

Ohio has more cows with 25,000 lbs. milk in a year than any other state.

Ohio stands third as a HOLSTEIN state with over 30,000 pure-bred HOLSTEINS.

Ohio has more than 200 fully Accredited Herds and over 1000 that have successfully passed one tuberculin test.

Ohio HOLSTEINS will make DOLLARS for you.

MINNESOTA-HOLSTEIN-BREEDERS THIRD ANNUAL CONSIGNMENT SALE

The State Sale Classic of the Year

Faribault,

IN THE THIRD STATE SALE Minnesota offers as usual the best she has. The sale's committee has searched the State and 80 head selected from 55 herds represent the most desirable Holsteins to be found in Minnesota. Type, Quality and Breeding were given first consideration—not an animal was accepted that would not strengthen any herd, —the sort that is always in demand, but is very hard to buy.

FARIBAULT
is on the C. R. I. and P. R. R. and C. M. & St. P.—60 miles south of the Twin Cities on the Jefferson Highway

Annual Pow Wow, May 3d
We'll be looking for you—
Make your reservations early

Among the offerings are:

The 1,015-lb. cow, **Brookings County Maid**—an outstanding individual, just fresh and again on test.

A daughter of **Sir P. O. M. 41st** from a 1,000-lb. daughter of **Sir Fayne Concordia.** She is bred to **Sir P. O. M. 37th.**

A daughter of **Sir Ormsby Hengerveld Korndyke** (son of **Mother Ormsby**) from a daughter of **King Segis Pontiac Count** and **Wisconsin Bess Piebe Laura 2d,** 34-lb. maternal sister to **Piebe Laura Ollie Homestead King.** She is bred to **King Segis Pontiac Count.**

A 21-lb. junior 2-year-old daughter of the $33,000 **Duke Pietertje Korndyke Ormsby,** son of **Sir P. O. M.** and the 3-time 1,000-lb. cow, **Jenny Wren Korndyke Hengerveld.** Bred to **Sir Pietertje Ormsby Mercedes 37th.**

A 30-lb. 4-year-old daughter of **King Segis Pontiac** from a 20-lb. 2-year-old daughter of a 30-lb. cow bred to **Duke Pietertje Korndyke Ormsby.**

A daughter of **Piebe Laura Ollie Homestead King**—a typical show daughter—that has 15,702 lbs. of milk and 726 lbs. of butter at 2 years, 11 days. She is bred to the wonderfully bred show bull, **Sir Inka Superior Segis.**

A daughter of **King Bess** (2 nearest dams, 1,243 lbs.) from a 20-lb. 2-year-old daughter of **King of the Pontiacs,** bred to **Sir Pietertje Ormsby Mercedes 37th.**

A 31-lb. junior 4-year-old daughter of **Sir Korndyke Glen** (652 lbs. of milk) bred to **Sir Hengerveld Pietertje Ormsby,** the son of **Chloe Pietertje Ormsby.**

THIRD ANNUAL CONSIGNMENT SALE
The State Sale Classic of the Year

May Fourth

A 28-lb. junior 3-year-old daughter of **Bessie Fobes Oak Homestead** bred to **Johanna Bonheur Champion.**

A 33-lb. daughter of **North Star Johanna De Kol Duke.**

The 30-lb. cow (586-lb. milk), **Marie Princess Hartog 3d,** bred to a 31-lb. son of **Duke Pietertje Korndyke Ormsby.**

Bess Johanna Oak, 967 lbs. butter, 22,224.9 lbs. milk at 3 years; and bred to **Sir Walker Segis Homestead,** son of the former world's champion, **Beauty Beets Walker Segis** and **Piebe Laura Ollie Homestead King.**

One of the greatest show daughters of the famous show sire, **Sir Pietertje Ormsby Mercedes 14th,** due at sale time to a son of **Ormsby Korndyke Lad** that is from a 1,000-lb. 2-year-old.

A daughter of **King Korndyke Colantha Ormsby** from a 27.5-lb. granddaughter of **Hengerveld De Kol** that should produce over 30,000 lbs. of milk this year. Bred to **Duke Pietertje Korndyke Ormsby.**

A daughter of the great show bull **King Segis Johanna Grahamholm** that as a junior 2-year-old produced in 7 days 20.27 lbs. butter from 479 lbs. of milk; in 365 days, 719.5 lbs. butter from 17,782 lbs. of milk. She is bred to **Dutchland Creamelle Colantha Lad.**

A daughter of **Ormsby Sensation** from a 22-lb. 2-year-old.

Daughters of **Sir P. O. M. 22d,** one from a 28-lb. dam, one from a 959-lb. 10-year-old dam, both bred to **"37th."**

A 1,000-lb. son of **S. P. O. M. 41st.**

A 34-lb. cow—**Sir Rag Apple Pontiac Segis Marie.**

And among the rest are some of the very best daughters of **"41st"**; a daughter of **College Cornucopia 2nd** from a 29-lb. 3-year-old dam and bred to **"41st"**; a n800-lb. jr. 3-year-old daughter of **King Korndyke Pontiac Lass** bred to **"Count"**; a daughter of **Sir P. O. M. 38th** bred to **Sir Ormsby Akkrummer Hengerveld**; a son of **Ormsby Sensation**; a son of **Piebe Laura Ollie Homestead King,** etc. We can't list them all here, though they are all "tops." Just the best specimens we have of Minnesota.

Breeders' Association
Minneapolis, Minnesota

Rice County (Minn.) Holstein Breeders'

First Annual Sale

Faribault, May Fifth

In the same Pavilion and on the Day Following the Third Minnesota State Sale

70 Head
All Females

70 Head
All Females

There are always some people who meet with disappointment at Minnesota's Annual State Sale. There are never enough cattle to go around in that great one-day event. And then, there are always some who attend that Sale that are not in a position to buy animals of the truly remarkable quality that goes to make up the Sale that is each year the classic of all state Sales.

In order that the needs of every man may be met, the Rice County Holstein Breeders' Association will hold a Consignment Sale of young cows and bred heifers the day following the State Sale.

A Sale Well Above the Average

In Type and Quality the offerings will very nearly match those of the State Sale. Rice County is the oldest established Holstein section of Minnesota and many of Minnesota's greatest herds are located here. It is from these herds that the entries have been selected. They represent years of careful breeding for Type combined with Production—the big, straight, deep bodied, square kind that are a credit to any herd.

Among the Offerings—A 25-lb. daughter of Sir Natsey De Kol Pietertje bred to a 34-lb. son of Ormsby Korndyke Lad; a daughter of the 1,000-lb. bull, Schilling Colantha Langtry from a sister to Sir P. O. M. 14th, bred to North Star Sir Fobes Homestead; a 535-lb. (305 days) yearling due in June to King Segis Pontiac Fayne Star; a 16-lb. 24-month-old heifer bred to "Fayne Star"; three heifers of exceptional type bred to the 37-lb. bull, King Echo Johanna Sylvia; a daughter of a 900-lb. 3-year-old and Sir Johanna Glen Ormsby, the son of the 1,323-lb. Glen Canary De Kol 2d; two daughters of the show bull, Nockdair King Segis Combination bred to Sir Walker Segis Homestead, son of a World's Champion daughter of "Count"; a 15-lb. junior 2-year-old due at sale time to the 1,200-lb. son of "Count", Col. Abbekerk Pontiac Segis; etc.

Size, Type and Quality—Mark every animal that will enter the ring. The sale offers a first class opportunity to the beginner in search of foundation stock. And a large share of the offerings are due to freshen shortly after sale date.

Spend May 3, 4 and 5 in Faribault

The Rice County Holstein Breeders invite you to spend May 3d, 4th and 5th in Faribault. Attend the big meeting of Minnesota's Holstein breeders on the 3d and visit the herds of Rice County. And then stay over for the two big sales, both managed by the

Minnesota Holstein-Friesian Breeders' Association

406 Market Bank Building, Minneapolis, Minnesota

SIR JOHANNA FAYNE

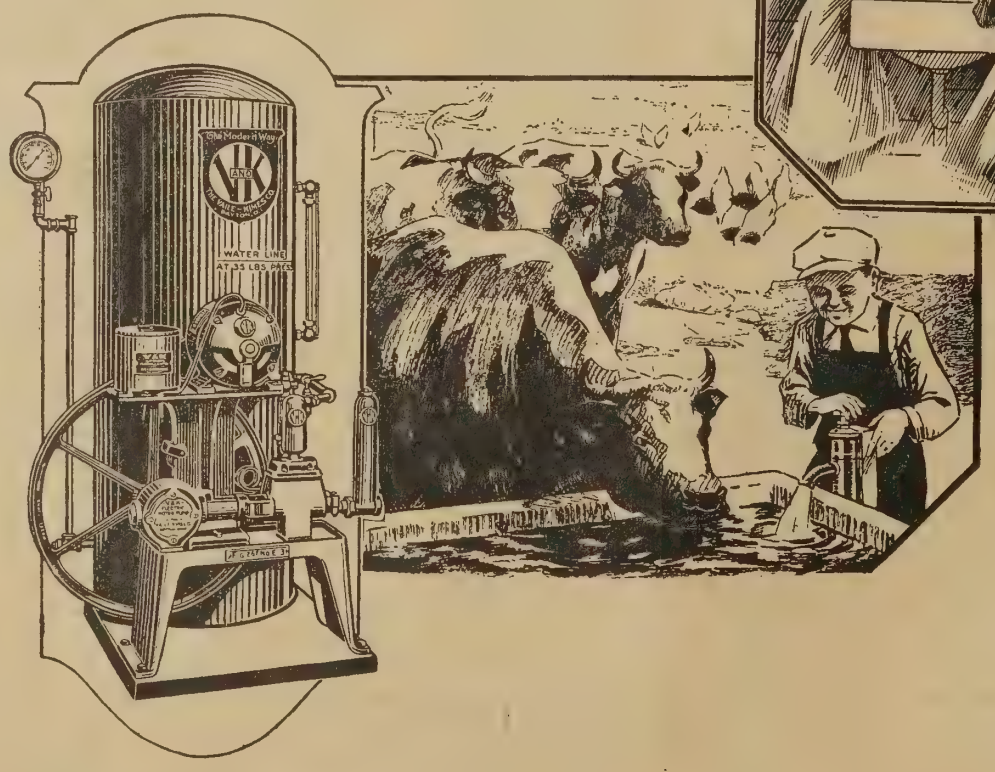
Good Plumbing In Country Homes

CRANE SERVICE

Makes it possible to select, through one central source of supply, practically everything needed for the extensive heating, plumbing and sanitation systems, the refrigerating and water plants, and piping installations for use in the country and may be secured through the plumbing and heating trades.

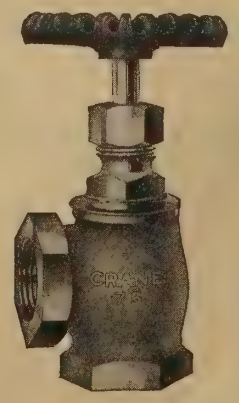
Means as much in the matter of comfort, health and convenience as anything else on the farm, especially when it is so easy to have

Running Water



— In the kitchen,
— In the bathroom,
— In the milkhouse,
— In the barn, etc.

by the use of a modern



WATER SUPPLY SYSTEM

Easily installed.
Fits any home.
Economical to operate.

The increased use of piping material in homes, on farms, and water systems where the pressure does not exceed 75 pounds has created a demand for these valves. They can be repacked while under pressure when the valve is fully opened.

HOARD'S DAIRYMAN

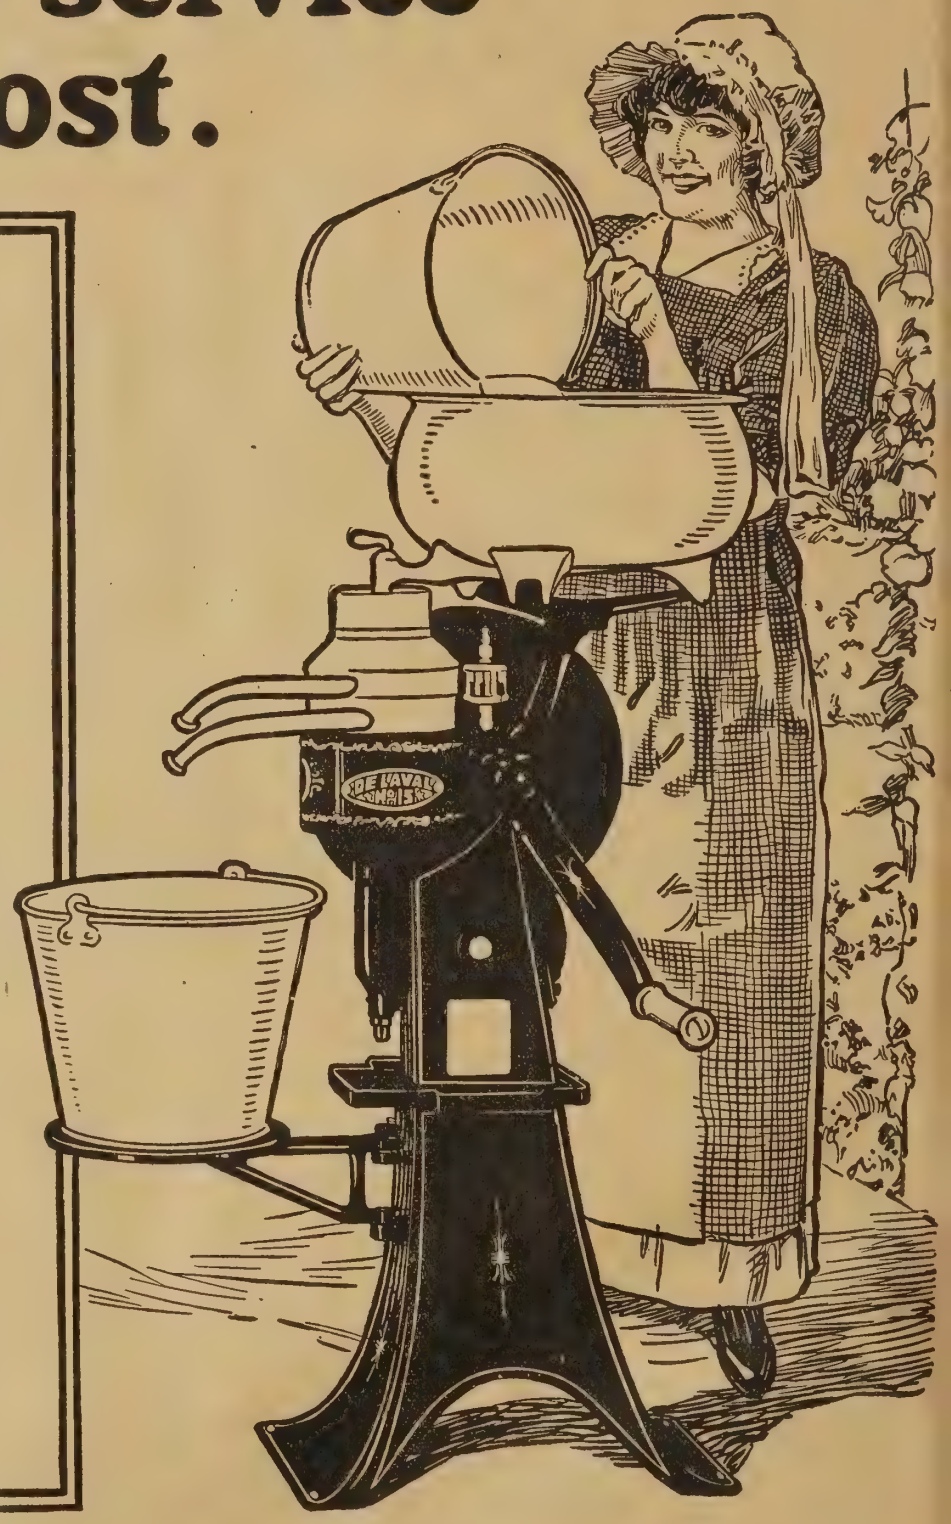
A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Fort Atkinson, Wisconsin Volume LXI, No. 15 April 29, 1921

Divide the price of a De Laval by its years of service for its real cost.

THAT the best is the cheapest in the long run is doubly true of the De Laval Cream Separator.

Divide the price of a De Laval by the years of use you will receive—there are thousands in use from ten to twenty years, and even twenty to thirty years is not an unusual life for a De Laval—and you get a yearly cost that is much lower than that of any other separator you can buy.



Consider also that during all these years of use the De Laval will skim with the utmost efficiency; that it will save instead of waste cream; that it will pay for itself over and over and return you the greatest cash income; and you will readily see why it is the most economical separator to buy.

The De Laval serves the longest time and saves the most cream; that's why there are more than 2,500,000 in use the world over.

Furnished with hand, power or electric drives; sold only through agents, and if desired, on such terms that it will pay for itself

The De Laval Separator Company

Possibilities of Irish Dairying

A. C. McCANDLISH, IOWA

SOLVING the Irish question is one of the most popular of indoor sports at the present time. Yet few realize that the main problem of the Emerald Isle is an economic rather than a political one, the political question being a result of and not a cause of the economic. It is not within our present scope to solve the troubles of Erin, but rather to show the relative economic position of Ireland compared to her sister countries in so far as these relate to dairying and other agricultural undertakings.

Ireland, with its encircling mountains and central plains is a great pasture country, though plenty of variety is introduced by barren hillsides and bleak bogs. The meanderings of the Shannon and Ban and other rivers of fame lead through fertile valleys; in Cork and Kerry and parts of Tipperary and other illustrious countries there are fertile loams; and even on many of the untillable hillsides the pastures are luxuriant.

The climate is equable, surpassing that of the remainder of the British Isles. The remarkable uniformity of climate can be seen from the fact that the average temperature varies only from 40 degrees F. in January to 60 degrees F. in July. Surely such conditions are well suited for dairying, and yet it is seldom that Ireland is even mentioned as a possible producer of dairy products.

Intensive Agriculture

Too often Ireland is looked on as the original home of the politicians and police of the world, while Irish agriculture is regarded as primitive. Primitive it is in many ways, but, when all the facts in the case are considered, it must be admitted that Ireland compares well with many other countries that have been given more publicity. The agriculture of Ireland that is primitive is picturesque and for this reason lingers long in the mind of the loiterer.

The agriculture of Great Britain, which includes Scotland, England, and Wales, is generally held up as one of the marvels of intensive agriculture, but in many ways it becomes rather insignificant when compared with the results obtained in Ireland. Ireland is little more than half as large as the state of Iowa and yet its population is double that of the "greatest state in all of the West", and this in spite of the fact that the population of Ireland has been decreased by one-half since the black days of the potato famine in 1847.

The great difference between Ireland and the remainder of the British Isles is that the major portion of the Irish population is directly dependent on agriculture; of the people in Ireland, 55 per cent of those over 10 years of age are actively engaged in agricultural pursuits, while in the other countries of the United Kingdom only 9 per cent of the population is similarly employed. This is further emphasized if the relative areas of cultivated land and of live stock be considered:

A Comparison of the Agriculture of Ireland and Great Britain on the Basis of 1,000 Acres of Land

	Ireland	Great Britain
Area cultivated, acres	703	566
Horses	27	23
Dairy cattle	77	53
Other cattle	171	79
Sheep	174	383
Pigs	48	34
Total population	222	568
Agricultural population	125	59

Although Ireland has only 222 people for 1,000 acres compared with 658 in Great Britain, yet the fact that it lacks large cities and their connected industries results in there being 125 per 1,000 acres connected with agriculture in Ireland as compared with less than half that number in the remainder of the British Isles. A greater percentage of the Irish land is also cultivated and the density of the live stock population is greater in every case, with the exception of the sheep, than that in Great Britain.

Dairy Cattle

When the dairy cattle are considered it is found that in 1920 Ireland had 1,580,734 coming under this classification. This group is quite broad but is comparable to that used in the United States. It is seen therefore that Ireland has more dairy cattle than any of the states of the American Union with the exception of Wisconsin. Ireland has never been noted for its native breeds of cattle; the only ones now in existence being the Kerry and Dexter. At one time, however, there were about four races of cattle in Ireland, ranging from the Longhorn to the polled or Maol. The Longhorn was somewhat similar to the Longhorn of England and, though it has practically been exterminated, traces of it are to be found in parts of Cork and Limerick. A curved-horn race was the predecessor of the miniature Kerry and Dexter, while the short-horned and polled races have been absorbed by the breeds imported from Great Britain.

The Kerry and Dexter are therefore practically the sole remnants of the original cattle of Ireland. Shorthorns appear to predominate now, but Ayrshires, Aberdeen-Angus, and other British breeds are to be found. The Kerries and Dexters form a small proportion of the total cattle of the country but they are to be found on many of the small farms, in fact, the Kerry is generally known as the "poor man's cow" as she can subsist on scanty fare and is quite a fair producer. The average annual production per cow in a number of herds tested by the Irish Department of Agriculture is 5,905 lbs. of milk and 251 lbs. of fat with a butterfat content of 4.2 per cent. This is a very good average for herds that are relatively unimproved but the claim that the cows with the highest yields of milk have the highest percentage of butterfat does not appear to be justified. The Kerry cow is small, weighing about 800 lbs., while the Dexter or Dexter-Kerry is even smaller and is a chunky individual not as well adapted to milk production as is the true Kerry.

Dairy Products

The chief industry of Ireland is agriculture. Its other staple industries are the manufacture of linen and whiskey, shipbuilding, and, to a lesser degree, the manufacture of woolen goods. With the exception of one primal industry, shipbuilding, the others are dependent on agriculture.

The income of Ireland is derived largely from her agricultural exports which go mainly to England and Scotland. The greater part of her export trade is devoted to feeder cattle which are one of the mainstays of the cattle feeders in other parts of the British Isles. Her dairy products also reach considerable proportions. In the last year for which full information is available there were 506 dairy factories in Ireland and of these 190 were co-operative undertakings owned by the farmers. The general practice is to haul the whole milk to the factories. Only two of them handled cream and nine of them milk and cream. Some of the milk is made into cheese but by far the greater portion of it is made into butter. In the factories under consideration, about 1¼ billion pounds of milk were used in the year being discussed.

The general conception of Ireland is that dairying is practiced mainly in the north, but, though Ulster is the main center of the linen and shipbuilding industries, yet the dairy industry is most prevalent in the South. Of the total number of dairy factories in the country, 333 are located in the southern province of Munster, while Leinster, Connaught, and Ulster contain relatively few.

The main outlay for Irish creamery butter is the populous centers of Great Britain and those who are not accustomed to consider Ireland as a dairy country are perhaps surprised when told that the greater part of the Irish butter ranks in the British markets with the far famed Danish butter. The main reason that it is not heard of more frequently is the fact that it has not been properly advertised whereas Danish butter has obtained fulsome publicity. Much of the Irish butter is considerably better in flavor and texture than the average run of Danish butter offered on the British markets.

Five 700-lb. Cows in Herd of Fifteen

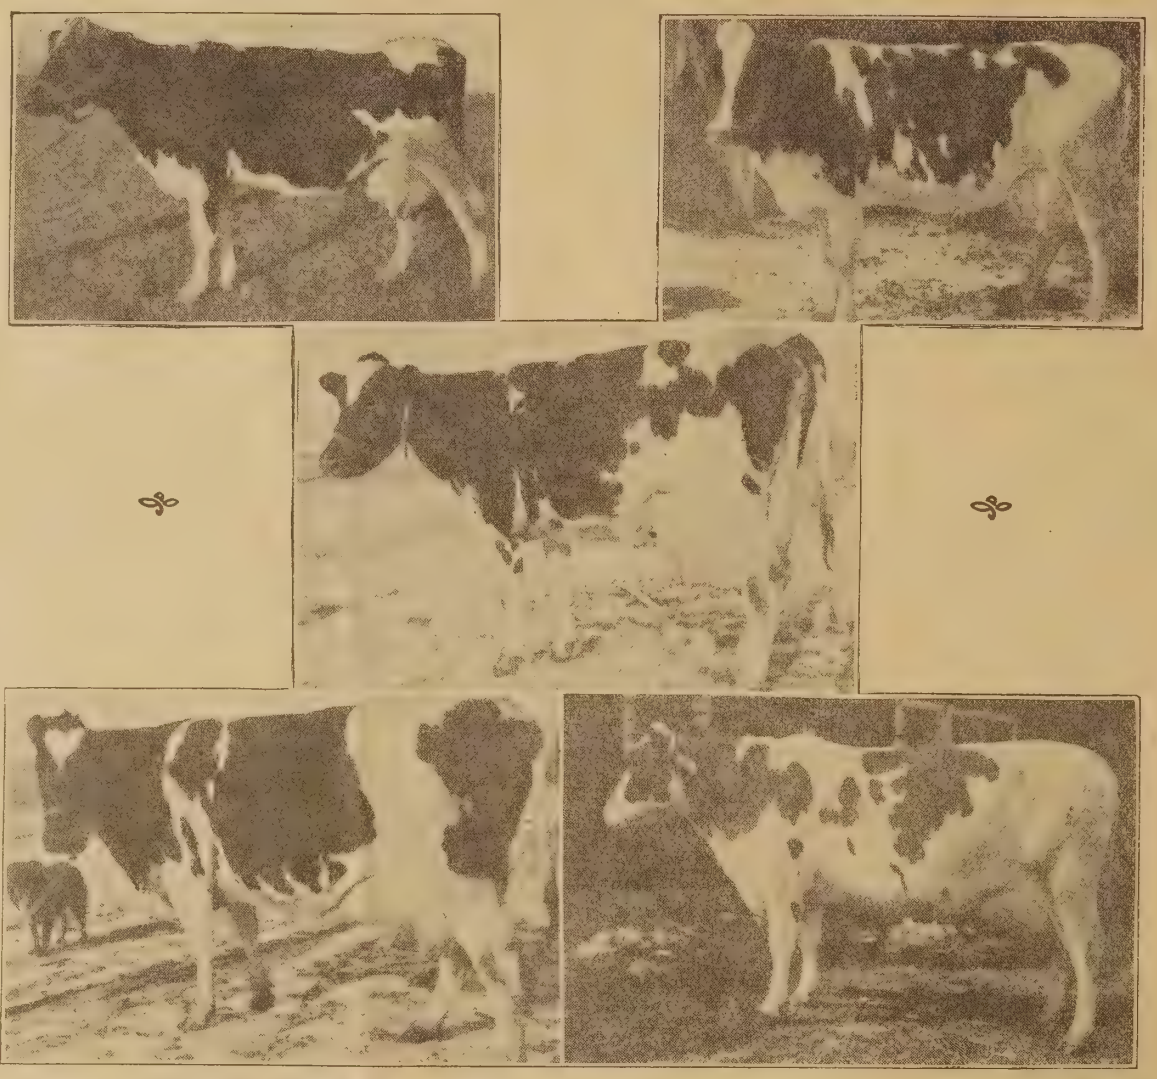
H. W. NORTON, JR., MICHIGAN

ASK any member of the firm of H. D. Box & Sons of Lansing, Michigan, the question, "Does Official Testing Pay?", and he will answer "yes" and invite you to the farm, where they have abundant proof of the correctness of the assertion.

The farm is about five miles southeast of Lansing, almost directly south of the Michigan Agricultural College campus. The buildings are not at all pretentious, just good, substantial farm buildings; but Messrs. Box & Sons are good, thrifty farmers and their cattle are well cared for. However, I doubt if there is a herd in existence which is more remarkable from the standpoint of milk production than this one.

The herd was established in 1913 but no attempt at official testing was made until two years ago. Yet when I was there recently five of the fifteen cows and heifers of milking age had produced above 700 lbs. of milk in seven days—five cows that had each produced more than one hundred pounds of milk per day for a week standing side by side in a herd of fifteen.

This herd, unknown outside of the immediate vicinity, became famous over night when Lady Clio Pauline De Kol produced 842.1 lbs. of milk in seven days and 3,394.8 lbs. in thirty days and her daughter, Model Lady De Kol, finished a record of 820.4 lbs. of milk in seven days and 3,228.7 lbs. in 30 days. Lady Clio is the only cow in the world that has produced above 800 lbs. of milk in seven days and has a daughter with a similar record. She was bred by M. J. McPherson of Michigan, and was nine years old when she made her record. Her sire, Pietertje Hengerveld Mercena King, was a grandson of Pietertje Hengerveld's Count De Kol, the great milk sire, and her dam, Calliope Pauline De Kol 2nd, is a daughter of Winnie Wayne Sir Paul De Kol, a grandson of De Kol 2nd's Paul De Kol.



Flossy Hengerveld Johanna Fayne, the second daughter of Lady Clio, is a full sister of Model Lady De Kol and has recently finished a record of 726.2 pounds of milk in seven days and 2,711.7 pounds in thirty days, at five years of age. Another member of this remarkable family is Queen Model Johanna De Kol with a record of 729 pounds of milk in seven days and 2,907.5 pounds in thirty days at five years of age. She was sired by King Model Johanna Fayne, the sire of Model Johanna De Kol Lad.

Queen Model Johanna De Kol is a daughter of Calliope Pauline De Kol 2nd and therefore a half sister of Lady Clio. Thus Queen Model Johanna De Kol is related on both sides to the two daughters of Lady Clio, her sire being their paternal grandsire and her dam being their maternal grandam.

This remarkable family of cows, with the exception of Lady Clio, were bred there on the farm and all four were raised and developed by H. D. Box & Sons. In addition to the two daughters with records above 700 and 800 pounds respectively, Lady Clio has two other daughters there at the farm, one a three-month-old calf and the other, Mabel Segis Fayne Johanna, with a junior two-year-old record of 459 pounds of milk and 16.4 pounds of butter. Mabel Segis will freshen again soon and gives every indication of upholding the family record when tested in her three-year form.

These cows are all large, deep-bodied cows of strong constitution and great capacity, and, needless to say, they are enormous eaters. Of the younger members of the family the one which attracted our attention more especially was the heifer calf from Lady Clio. This heifer was sired by King Lansing, a son of Sir Korndyke Veeman Hengerveld, one of the best bulls ever used in Michigan and the sire of seven thirty-pound cows, and out of Dora De Kol Oosterboom, a 32.5-lb. cow with milk records of 745 lbs. in seven days and 3,022 lbs. in thirty days. The two nearest dams of this calf, therefore, have records averaging 793.5 lbs. of milk in seven days and 3,208.4 lbs. in thirty days.

One other member of the herd, Midnight May Johanna De Kol, a six-year-old cow, had just finished a test at the time of my visit, making 714.4 lbs. milk in seven days, with 112.7 lbs. of milk for the best day. This cow represents a different line of breeding from the other four, but was bred and raised there on the farm. Her sire was Karl Midnight Johanna 2nd and her dam Ianthe Maid De Kol.

Above—Left, Flossy Hengerveld Johanna Fayne, daughter, 726.2 lbs. milk in 7 days, 2,711.7 lbs. milk in 30 days; right, Model Lady De Kol, daughter, 820.4 lbs. milk in 7 days, 3,228.7 lbs. milk in 30 days. Center—Lady Clio Pauline De Kol, dam, 842.1 lbs. milk in 7 days, 3,394.8 lbs. in 30 days. Below—Left, Midnight May Johanna De Kol, 714.4 lbs. milk in 7 days; right, Queen Model Johanna De Kol, 729 lbs. milk in 7 days, 2,907.5 lbs. milk in 30 days.

Keep the Soils Fertile

A. R. WHITSON, Wisconsin College of Agriculture

IT takes at least one-quarter of the cultivated land in clover to supply the hay for cattle and sheep. Clover not only makes more milk than timothy, but it makes better manure, and that means more corn and oats. Good clover fields show where the good farmers live. We ought not to buy nitrogen in fertilizers when we can get it incidentally in growing the feed we need; and even if we did not need the clover for feed we could gather the nitrogen by growing clover to plow under cheaper than we could buy it in fertilizers.

When Soils Need Lime and Phosphorus

The soils now growing heavy crops of clover and alfalfa do not need lime for these crops, but when these crops do not do well it is a pretty sure indication that they need lime and phosphorus.

The first application of ground limestone on such soils should ordinarily be at the rate of two tons for clover and three or more for alfalfa for the first rotation. After that, one ton every three or four years for the rotation in which clover is grown, and two tons per acre every time a field is reseeded to alfalfa, should be applied. Limestone should be applied after plowing, either in the fall or in the spring.

We Must Buy Phosphorus

One of the greatest opportunities for increasing yields of crops is through the use of phosphate fertilizers. Phosphorus is leaving the farm constantly in concentrated form in the bones of animals, even if grain is not sold, and soils all contain so small an amount of this element that we must replace every bit we sell, or the fertility standard will be lowered. Governor Hoard realized that fact and used phosphate fertilizers on his dairy farm regularly.

First Rules for Maintaining Fertility on the Dairy Farm

1. Not less than one-fourth of the cultivated land should be in clover or alfalfa.

2. Use lime when needed to keep clover or alfalfa growing well.

3. Use every three or four years from 200 to 300 lbs. of acid phosphate, or 125 lbs. of treble superphosphate per acre.

4. Use carefully all manure produced.

Should We Buy Feeds to Get the Phosphorus?

On the ordinary dairy farm where little grain is sold, and where only a moderate amount of bran, or other concentrates, is purchased, the practice of applying 200 or 300 lbs. of sixteen per cent acid phosphate, or 125 lbs. of "treble superphosphate" per acre every three or four years will maintain the phosphate supply in the soils, and aid in keeping the yields up to a high standard.

Farmers who buy large amounts of concentrates and sell little or no

BACK TO THE FRIENDLY FARMHOUSE

HELEN S. K. WILLCOX, NEW YORK

LIVING ROOM

PER LEE PLACE—HOME OF THE AUTHOR

PARLOR

THERE has been much discussion of late years as to why our farms, here, there, and everywhere, are daily being deserted by those born and bred in the country who would naturally remain to inherit and carry on the good and necessary business of feeding the world. The blame has been placed first on one cause and then on another, but it is left to the U. S. Department of Agriculture last year to put its finger on one of the best reasons, and one heretofore apparently ignored—the fact that eight out of ten farm women are not only deathly sick of their endless hours and arduous labor, but particularly because they are sickest of their unattractive, inconvenient houses which, even in the enlightened rural-America of today, compare too unfavorably with many moderately crowded urban flats.

The average farm house is not half convenient enough and so far as its one peculiar charm and appeal goes, too often hasn't any. The truth is that almost every farm house, no matter how much it may tower above its neighbors because of this or that improvement, can be made more appealing and more attractive from a good-looks standpoint, while the ninety and nine which lack any pretense at such much needed reforms offer striking material for radical changes. It was thus strangely left for agriculture's own farmer to corroborate what every farm woman instinctively knows—that she is not going to stick contentedly to her big job any longer if the house, among other things, must continue to repel instead of attract.

But, someone says, if you don't like your home as it now is, why not change it to suit rather than envy the city woman's? If she were consulted probably you would listen to a tale of insufficient, restricted spaces, of steep stairs to climb or of irritating elevator service, of dark hallways, of indifferent plumbing and outrageous gas bills! It is almost certain that Mrs. City Woman would vehemently deny that her house is a veritable paradise on earth just because it boasts a multitude of labor-savers and several specimens of smart looking installment furniture, without which Mrs. Farmer sometimes mistakenly feels that she can never be really happy. On the other hand, Mrs. Farmer Woman owns to coveting our big farm yards so full of alluring possibilities in the way of flowers, fruits, trees, shady walks, and beguiling gardens; also the big house with its high-ceiled rooms and generous spaces—a house sizable enough to call a bedroom a bedroom, instead of bringing forth a temporary guest room out of thin air by waving the living room divan into a full fledged bed with all accoutrements!

Yet the fact remains and will not be downed; our farm houses are several decades behind our progressive farm times and although some of us are happy at last with electricity and hardwood floors and so on, the majority of us are still engaged in hunting the real secret of why we want to get away and stay away, and this secret is: our homes simply lack that friendly, knowing touch which magically combines good taste, individuality, and charm—three indispensable virtues which are the rightful heritage of every faithful old dwelling in the countryside.

It is trite to remark that the house is the heart of the farm, yet we too often insist upon forgetting it and are content to complain because we do not inhabit the home of our dreams, the counterpart of which some other woman may have transformed from far more humble beginnings than the one with which we must deal. At the same time it is apparent that a surprising number of us take too little constructive thought for the place where we spend the greater part of our lives and although our excuse is that we are the busiest creatures on earth and the regular work must come before house hobbies, yet such seems strange and illogical reasoning when a woman and her home bear such close and intimate relations.

There is an old saying to the effect that everyone finds time somehow to do in this world what he most wants to do. Judging, then, by the thousands of farm houses which show not a trace nor spark of beauty and charm, we must conclude that their mistresses do not regard them in the light of pleasurable possessions, but rather irksome duties not worth the "tackling".

In a recent Woman's Home Companion an article entitled "Through English Eyes," by Mrs. Irvine, corroborates this indictment of American farmers where their "earthly mansions" are concerned. Says Mrs. Irvine, "I remember the flat fields about Chicago, dismally brown where they were not deep under snow; and then gazing out of the train that carried me from Southampton to London, I could hardly contain my amazed joy at the very vivid green of the hedge rows and the fields that flew past me. And I thought to myself how proud I should be to take my American friends into English villages, that they might contrast our picturesque cottages with the dull wooden farm houses, suffering apparently from a paint famine, gardenless, and ungracious, that one sees between New York and Chicago."

Mrs. Irvine went on to say that the interiors of American farm houses were often far more inviting, from the standpoint of doing work handily, than is the average British living place, but this advance over our cousins across the sea cannot entirely excuse our manifest lacks in the matter of charm and hominess as such virtues are sized up by the passerby or the transient within our gates. The writer's home ten years ago this spring could well have been numbered in the houses "suffering from a paint famine, gardenless, and ungracious" as described by the lady from England. The house as we came to it possessed the same good lines—rectanglar post-Colonial—as shown today in the photograph, but the rear where the greatest changes took place fails to reveal its transformations as caught by the camera, so a description a bit later on in our house narrative will have to convey how these things were brought about.

We started in on the old homestead's interior on the theory that it is indeed hard on the traveller to witness the gradual decaying and going down of folorn old farm dwellings, but at the same time it is much harder on those who must abide within their walls and daily reflect the gloomy atmosphere thrown off by such homely unattractiveness.

As we found our home-to-be typically uninteresting and down-at-heel, while means to change it for the better were at the time typically lacking, a great deal of thought and makeshift and ingenuity were required to at all satisfy the house standards we had set for ourselves. The two large front rooms, divided by a wide, long, old fashioned hall, were extremely good in their proportions, each containing an original fireplace which only needed uncovering to add its wonderful bit; so plain oatmeal paper in a soft tan with harmonizing ivory paint transformed parlor and living room and hall into liveable, enjoyable rooms—contrasts indeed to the same walls done in hideous "figured" wall paper. As the house is a century old, the floors were made of foot-wide boards which, of course, had always been hidden from view by carpets. But it was not my plan to use carpets in this day and age, and, as we could not afford hardwood floors, the problem was to make the best of the rough, bare boards without resort to artificial wood-like linoleums or expensive carpet fillers. Upon the advice of a certain interior decorator who is supposed to know her business, I was urged to paint around the rugs in soft gray, olive green, or tan and in no wise attempt to cover the old boards which had done such long and arduous service.

I was told that ancient floors so treated were considered rightfully correct and proper today and to replace them with oak or birch (as I had yearned to do) would not be at all in keeping with the old time atmosphere of the house. So to this day our floors are as they were over a hundred years ago, and rivals of hardwood are denied all entrance. So you farm folk who lack money to put in modern floors, take this "tip" from a professional decorator as I did and keep your old ones, painted in dull, unnoticeable colors, while your dollars go into some other part of the house needing more attention.

Like the little girl who, when she was good, was very, very good, our three main rooms—living room, parlor, and big hall—were now very, very good from an artistic standpoint, but the back of the house contained a baffling assortment of closets, small, odd rooms, and additions, including one immense unhandy kitchen, as horrid as the little girl when she became thoroughly naughty. It was obvious that we could not live in our pretty main part all the while and blissfully ignore the awful kitchen-dining room and its surrounding territory, so there was but one thing to do—wade in, cut out partitions right and left, insert others where needed and pray for eventual organization to emerge from the chaos and confusion.

The white paneled dining room which shows its lower end in picture was the most satisfying result we achieved from this grand fix-over. This was once the old, discouraging kitchen, with a little sink far from any window and all other work room

(Continued on page 635)

EST ROOM, SHOWING FAMILY CRADLE AND FOUR-POSTER

DINING ROOM WITH FIREPLACE AND BRICK OVEN

EDITORIAL COMMENT

A SOUTHERN Wisconsin creamery, recently reorganized, remodeled, and equipped with up-to-date machinery, has contracted its butter with a Chicago firm at a price which will give it one cent above the quotation for extras. The firm buying this butter furnishes the cartons and pays the freight and drayage. The firm buying this butter knows that this creamery is in position to manufacture an extra fine quality of butter and is willing to pay a substantial premium for such butter. We have many times pointed out the necessity of producing high quality dairy products because it is one of the ways of increasing the dairyman's income.

THE severe liquidation of farm products would be accepted more gracefully by the farmer if the finished product which he must purchase were reduced in price in keeping with the commodities produced.

Corn, for instance, is selling below "pre-war prices", yet corn starch is selling for 12c a pound and before the war six pounds of starch could be purchased for 25c. In other words, the farmer is selling his corn cheaper and paying close to three times as much for starch. If everyone were taking a loss the same as the farmer, there would not be a basis for complaint.

It is expecting too much to have everything adjusted at the same time, but it would seem that the products made from what the farmer sells should not be 2½ to 3 times higher than they were before the war when his products are selling below pre-war prices.

DIRECT RATIO PAYMENT

Many Wisconsin condensers have just adopted the "direct ratio" in payment for milk. A certain definite price is fixed per hundred for 3.5 per cent milk and for each point (one-tenth per cent) in test above or below 3.5 per cent there is added or deducted an amount equal to the price per hundred divided by 35.

Stated concretely this means that if the price is fixed at $2.10 per hundred for 3.5 per cent milk, there would be added 6 cents ($2.10 divided by 35) for each point the milk tested above 3.5 per cent, a like sum per point being deducted for test below 3.5 per cent. The following table gives the prices per hundred that would obtain when $2.10 is set as the basic price per hundred for 3.5 per cent milk:

Test of milk, %	Price per cwt.	Test of milk, %	Price per cwt.
3.0	$1.80	3.9	$2.34
3.1	1.86	4.0	2.40
3.2	1.92	4.1	2.46
3.3	1.98	4.2	2.52
3.4	2.04	4.3	2.58
3.5	2.10	4.4	2.64
3.6	2.16	4.5	2.70
3.7	2.22	4.6	2.76
3.8	2.28	4.7	2.82

If the price of milk is set at $2.45 per hundred for 3.5 per cent milk, the price per point would be 7 cents; if set at $3.00, it would be 8 cents; and if set at $3.15, it would be 9 cents.

In actual practice this new method is the same as the payment for milk on the basis of its actual butterfat content, just as creameries pay for cream. The basic price of $2.10 per hundred for 3.5 per cent milk is identical with paying 60 cents a pound for fat, and the person delivering 10,000 lbs. of 3.8 per cent milk would receive $228, or at the rate of 60 cents per pound for the 380 lbs. fat it contains.

This system of payment is quite a radical departure from what has previously existed, but our best authority on condensed milk, Professor O. F. Hunziker, has repeatedly said it is the fairest and best system of paying for milk that is to be condensed. The old system of payment has merely been the means of putting low testing milk at a premium, has engendered the breeding of low testing cows, and has made it a decided temptation to partially skim all milk delivered to the condenseries. The result has been that the average test of milk at condenseries has dropped in many instances to as low as 3.3 per cent. To produce legal condensed milk from this low testing produce has necessitated the addition of cream to bring the average test to not less than 3.5 per cent, and some condenseries standardize to as high as 3.75 per cent.

Argument for and against the proposed system will wax warm. It will be acclaimed by the partisans of the higher testing cows and damned by the partisans of the low testing cows. It is, however, a step in the right direction, but time will doubtless bring some modification. Condensers assert that the price they pay for milk should not be based on the butter and cheese market, but only on the market for their own product, condensed milk. Others argue that the condensery really requires milk of a certain test, say, 3.5 per cent, and that they should set a basic price per hundredweight for such milk on the basis of the prospective market, demand, and supply. For tests above or below this they should make additions or deductions on the basis of the prevailing quotations of butter.

THE DAIRY SITUATION

A subscriber asks us to discuss the dairy situation and desires to know whether dairy farmers are satisfied with the prices received for milk and fat.

The milk situation in sections supplying cities with market milk is not as satisfactory as could be desired. There is a wide variation in the prices paid for market milk throughout the United States. Some sections are receiving very good prices considering the decline in other farm products, and in some sections prices are too low. In fact the creamery, when the feeding value of skimmilk is considered, is giving the farmer better returns than is received in many sections for market milk. We cannot recall any section where the prices of milk have declined as much as the prices of corn, cotton, hogs, and cattle. In this respect the dairy farmer is much better situated than the farmer growing grain or producing meat. On the whole, the patrons taking milk to creameries and cheese factories are in much better position than any other class of dairymen.

The prices of both butter and cheese have not declined as much as other farm products, and since there has been a large decrease in the prices of mill feeds, the patrons of creameries and cheese factories receive a larger return from their cows on feed consumed than at any time in several years past.

Bran is selling for $20 and less per ton. Corn ranges from $14 to $24 per ton. Oil meal can be purchased at less than one-half of its highest price. Hay has remained rather firm, but corn silage is being calculated on a much lower basis this year than last, since corn is selling at the farm for 40 to 50 cents per bushel.

On most well managed dairy farms hay is produced for feeding cattle and in some cases there is a little surplus to sell. There is no question but that in sections where dairy cows are kept hay is bringing a much larger price than where there is not enough live stock to consume what is produced. In dairy sections hay is worth in the neighborhood of $25 per ton and where not many cows are kept, good alfalfa hay has sold at $8 to $10 per ton.

The prices of mill feeds are not much, if any, higher than they were in the years 1913-1914, and butter and cheese are selling at much better prices, This is why we take the position that the dairy farmer is receiving more for his feed marketed to the dairy cow than in several years past. The prices for dairy cows are good. Recently a herd of 48 grades sold at an average price of $168. Several carloads have been shipped out of one community at an average price of $175. Well bred pure-bred cattle are selling at good prices. demand for both grade and pure-bred dairy c indicates an improvement in the dairy situation an increased interest in the production of mil farmers who have been engaged in other bra es of agriculture. These men would not be t ing toward the dairy cow if they had not com the conclusion that she was a better market the elevator for their farm products. It is opinion, based upon the prices of dairy prod and feeds, that the dairy cow offers the best ket for farm products.

COMMITTEE OF SEVENTEEN

The chairman of the Committee of Sevent Mr. C. H. Gustafson, in presenting the plan marketing grain, enunciated what we consid very important principle for every one intere in the improvement of marketing farm prod In referring to the plan of the Committee of enteen, he said:

"It is purely a co-operative plan offered in petition with existing unsatisfactory method marketing. The success of the plan does not upon the bestowal of special privilege, class leg tion, or governmental appropriations. It is a ness proposition—on a co-operative basis. The tire plan rests purely on business principles a is based on the fact that the farmer is as ab commercialize his products and conduct his business as are the producers of any other ucts."

We like the spirit expressed by Mr. Gusta Too many farmers have been looking to the ernment and to outside agencies for carryin affairs which rightly belong to them. The far of this country have sufficient brain power initiative to perfect a system of marketing products without the assistance of the govern or any other agency. It is our hope and d that the American Farm Bureau Federation continue its efforts until every branch of ag ture is so organized that farm products ma marketed in an orderly manner and upon the basis as is carried on by other enterprises.

The Committee of Seventeen has done a piece of work and the results accomplishe their plan will depend upon the support whic grain growers give to this new method of mark grain. It offers the farmer a sane and sen plan for marketing his grain but, unless he advantage of it, it will not bring relie place him in control of marketing his own modities. If it fails he cannot blame the sy big business, or any other agency. He alone be responsible because he has not accepted plan which makes it possible for him to be m of his own marketing affairs.

NATIONAL DAIRY CONFEREN

The American Farm Bureau Federatio calling representatives of the various bra of the dairy industry together to s information that will assist in its dev ment. This conference will be held in Chi May 3 and 4, at the Congress Hotel. The farmers have come to believe that since they duce milk they should have something to say a the price of market milk. Until recently carried their milk to the distributor, and a "What will you give us?" They now have agents, in many places, who meet the distribu and discuss market conditions and deter prices. This is logical and fair. The metho arriving at the prices of market milk and han surplus is not uniform and there is opportuni least to have a better understanding of the m ods in vogue and perhaps in the end adopt a form plan of selling market milk and handling plus.

Besides the market milk industry we

meries, cheeseries, and condenseries which titute the larger part of the dairy industry. nost instances these institutions are located ide the milk shipping territory and are rally considered in the unorganized territory. desirable that the creameries and cheeseries rganized into federations that their products be graded and marketed to better advantage. value of such organization and co-operation be thoroughly discussed at this conference everyone interested in these institutions is come to this meeting.

his conference will discuss present methods of keting dairy products, opportunity for improv- marketing, the relation which one branch of rying bears to another, the value of by-prod- s, and why creameries and cheeseries should be erated. It is an opportunity to discuss the im- fections of the present methods of marketing ry products and to lay plans for conducting the ry industry on a more satisfactory and efficient is.

Every farmer who can spare the time and desires help make dairying a better industry and to rect bad and uneconomic practices should at- d this national conference. Our dairy problems l never be solved by complaining about the sent system of manufacturing and marketing iry products, but by obtaining information of bad and uneconomic practices. We must first ve definite knowledge of our dairy conditions fore we can proceed intelligently and safely to rrect the evils of the dairy industry.

Moldy Silage

Last fall I filled silo with corn that was dead pe and frosted, consequently it was very dry. I t a tank of water and run a stream of water into ower, used a distributor inside silo and had it ell tramped. When I took it out, here and there rough the silage would be moldy cakes and as I eared the bottom a large part of the silage was oldy. As I used it off it seemed to heat readily nd what was not already moldy would soon start mold.

Quite a number of the silo owners are complain- ng of moldy cakes through the silage this year particular; in fact, the trouble has been preva- nt for the past two or three seasons. It does ot seem to make any difference what kind of silo used as there are various kinds and it does not eem to make any difference how green or how ipe the corn is when put in. I helped fill silos last all with corn in all stages of ripeness and it seems o have made no difference.

Any information you can give us would be reatly appreciated by your readers in this com- nunity as nearly every one reads the Dairyman.

My opinion is that there is some kind of bacteria causing the trouble that is uncommon to silage. Another theory is that the machine may have been run at too high a speed and the air was concen- trated on a certain spot by the aid of the distribu- tor inside when the machine was idle during the time of changing wagons. The air may not have all been squeezed out and left a sort of air pocket which helped cause the molded cakes.

Slippery Rock, Pa. J. C. D.

We cannot give a better reply than that given by Professor Eckles in our issue for March 18th. He there speaks of the necessity of a sufficient amount of moisture and sufficient packing in order to overcome the mold formations. We anticipate that one reason for both these requirements is to insure that the corn ferments rapidly and reaches a high heat 12 to 24 hours after ensiling. This high heat not only sterilizes the silage material but the fermentation itself consumes the air which the silage molds require in order to grow.

Our inquirer asks for the experience of other readers of Hoard's Dairyman. What have they to say?

Acid Phosphate and Soil Acidity

Referring to the article, "Grow More Clover Seed", it is stated that growing clover is not difficult where manure, acid phosphate, and lime are used. If clover is so susceptible to acidity, how can the acid phosphate be beneficial? It seems to me that the amount of lime used was not more than enough to counteract the soil acidity.

Mondovi, Wis. A. K.

Acid phosphate is applied to clover because of the demands of that crop for phosphorus. The amount applied (about 200 lbs. per acre) is not sufficient to make any great difference in the acidity of the soil. The Hopkins' theory of soil fertility holds that phosphorus, lime, and clover are all that is necessary to maintain and improve the fertility of our soils and insure maximum crop yields at a minimum of expense and they rely on rock phosphate. There is some controversy between the two forms of supplying phosphorus to the soil, but it has always been our opinion that either one is reliable and desirable and is a profitable investment for any farmer whose soil may be lacking somewhat in available phosphorus. The majority of investigators are of the opinion that acid phosphate is more readily available to the growing plant and for this reason its use is, perhaps, somewhat more generally recommended.

No person can recommend the actual amount of lime to use per acre. This is due to the fact that it is not known in any given case just how much acidity there may be in a particular soil nor what the quality of the particular lime may be that is applied. With the Truog acid test, the amount of acidity of the soil can be ascertained and, with a guaranteed analysis as to the lime to be used, it can be reckoned with a fair degree of safety as to the total amount of lime that should be applied per acre over a period of 3 to 5 years.

Silo Too Large

About two years ago an agent sold me a tile silo 12 feet in diameter and it is much too large for my small herd, half of the ensilage spoiling as I have not enough stock. I have thought of putting a brick partition across, making two small silos out of the large one. The partition would be cement coated on both sides so as to make it air and water proof.

La Crosse, Wis. C. G. Z.

The suggested partition of the silo will possibly work out all right, particularly if the corners are rounded out. It will be necessary in filling, however, to exercise particular care to see that these corners are properly packed as otherwise the silage will not settle evenly and there will be considerable spoilage at these points.

The worst feature of the partition is that it must be sufficiently strong to withstand the outward pressure of the ensiled material, and it is doubtful whether a brick wall will do this unless each side of the divided silo is filled at the same time. During the filling process and prior to the time the silage is fully settled, there is a considerable lateral pressure exerted by silage. This is sufficient to bulge out walls unless they are strongly reinforced.

There have been several methods suggested for handling silage to keep it from spoiling where a relatively few head of stock are being fed. One of these is to feed down one-half of the diameter of the silo for a week or more, and then clean off what is spoiled on the other half and feed this down, alternating in this manner from side to side. There is, of course, spoilage in this manner of handling but it can be partly obviated by covering the unused half with tar paper, canvas, feed sacks, wet straw, or other material which will exclude the air. If paper or canvas is used, it may be necessary to put on some weight such as silage or something else that will hold it down tightly to the surface and exclude the air. It would be desirable to wet down the top of the silage with a few buckets of water before putting on the extra cover; the purpose here is merely to exclude the air, and anything that will answer this purpose will help to stop any excessive spoilage.

Other men have used the system of taking off alternate halves of the silage every other day, keeping the unused half covered as under the previous plan. Some of our readers have suggested the sprinkling of two or three pails of water over the silage after taking off one feeding. This seems to help if care has been exercised in not loosening up the silage left in silo after taking off the layer for feeding purposes.

Cows Need Succulence

Please give me a balanced ration of the following feeds: Corn, kaffir, oats, cotton cake; all of these being ground thoroughly with plenty of alfalfa and roughage. Do you recommend feeding a cow on natural pasture? If so, what of the above would be suitable for such?

Oakhill, Kansas. F. S. J.

The combination of feeds being fed will easily provide a good balanced ration, for with alfalfa hay it would be difficult to get a combination of grain that would not supply an adequate amount of protein. The chief weakness is the lack of succulence. Dairy cows do better when they can be fed silage or roots. They not only desire this bulky succulent feed for doing their best work and for keeping their digestion in good condition but they will make better use of the other feeds given them. Cows fed upon dry feeds very often become constipated unless they are fed a pound of oil meal daily. Oil meal is better than cottonseed meal where the roughage contains no succulence.

Cows, on pasture, as a rule can be fed some grain with profit. When first turned out in the spring and grass is very tender they may not care for any concentrates for a few weeks or so long as the grass remains exceptionally good. A little roughage like alfalfa hay will be very acceptable to them at this time and will help to prevent severe scouring. When the grass begins to get a little old, and particularly if short, the feeding of a mixture of ground corn and oats, equal parts by weight, will be advantageous. It will help to increase the milk flow and prevent a rapid decline in milk production which is a factor too often overlooked in the care of dairy cattle.

Killing Crows

Can you suggest an effective remedy to prevent crows from destroying a corn seeding? Have tried shooting them for two seasons but acreage is large and crows many.

Toledo, O. J. S.

Perhaps as good a method as any is to make use of a poison bait, mixed in the proportion of 20 quarts of corn, 1 oz. of strychnine, 2 tablespoonfuls of starch, and 1½ pints of water. Mix the starch and strychnine in the water and heat to boiling, stirring thoroughly after the starch begins to thicken. Pour this mixture over the corn and stir until every kernel is coated. The corn may then be spread out and dried.

Whenever a feeding ground of the crows is located, the poison bait should be distributed if it can be done without danger to domestic animals. The crow is a wary bird and after treatment has proven effective on one ground the birds that do not get the poison are likely to avoid that field. Heads of cattle or other fresh carcasses may be treated with strychnine and placed in trees or places frequented by crows.

Amount of Cottonseed Meal to Feed

Kindly advise us what capacity of cottonseed meal could be fed to one cow, without injury, giving three gallons milk per day. Our ration consists of one-half gallon hominy meal, one pint cottonseed meal, and balance bran (one gallon in full with all three).

Georgetown, Ind. E. N.

Under ordinary feeding conditions we would not advise feeding more than one pound of cottonseed meal per day per cow. Two pounds may be fed with perfect safety to very large cows producing exceptional flows of milk. We appreciate that there are those that feed 3 and 4 lbs. of cottonseed meal per day per animal and in the South it is not uncommon to find feeders using as high as 7 or 8 lbs. We consider this unwise feeding and it would be especially so in the North where the animals are not as accustomed to cottonseed meal as those in the South. Taking it by and large we would not recommend feeding more than 1 to 2 lbs. of cottonseed meal per day per cow.

Valuing Corn Silage

Please furnish me with the present market prices on corn silage.

Milwaukee, Wis. E. G.

It is very difficult to estimate a fair price for silage because there is no genuine market on this feed. In addition, prices will, in part, be determined by the quality of the silage itself.

In calculating costs of milk production it has become the practice to fix the price of a ton of corn silage at one-third the price of a ton of hay; that is, if hay in the mow or stack is worth $18 a ton, corn silage in the silo, if of good quality, would be valued at $6 a ton. In actual feeding practice and because of the greater succulence of corn silage, we have estimated that one ton of timothy hay will displace not over 2½ tons of corn silage.

Another system of estimate, that has been used occasionally, has been to multiply the market price of corn on the local markets by 5, accepting this as the valuation of a ton of corn silage. This is based upon the average content of five bushels of corn to a ton of silage and the assumption that the value of the cornstalks offsets the extra cost of harvesting and marketing the ear corn.

We find that, as a general rule, Wisconsin farmers are this year estimating good corn silage at about $6 per ton, the range being from approximately $5 to $8 per ton.

Manufactured Dairy Products for 1920

A Decrease of Three Billion Pounds of Whole Milk Used in the Manufacture of Dairy Products is Registered

THE following table gives the amount of butter, cheese, condensed milk, etc., produced in factories in the United States during each of the past three years as reported to the United States Bureau of Markets. It does not include dairy butter or cheese made on farms, market milk, milk consumed by calves, etc., which accounts for over 50% of the total milk production of the country. The figures are preliminary and are not complete, but it is believed they are comparable and will come within five per cent of the actual total milk used in manufacture:

Whole Milk Products	1920 Lbs.	1919 Lbs.	1918 Lbs.
Creamery Butter	835,604,418	851,269,140	793,275,309
American Cheese	242,194,615	288,025,207	256,378,662
Swiss Cheese	18,679,073	20,387,306	18,586,505
Brick and Muenster Cheese	40,685,380	37,521,004	43,332,215
Limburger Cheese	7,169,871	7,625,541	8,808,140
Cream and Neufchatel Cheese	6,857,847	5,500,639	5,774,630
Italian Cheese	4,675,485	3,987,361	2,042,284
Other Full Milk Cheese	12,085,681	9,661,497	11,088,236
Condensed Milk	359,338,990	609,575,717	458,354,600
Evaporated Milk	534,772,547	1,234,202,722	1,090,049,868
Sterilized Milk	4,288,855	4,420,713	6,257,710
Malted Milk	19,631,554	17,495,887	15,654,243
Powdered Whole Milk	10,313,443	8,660,785	4,164,334
Powdered Cream	327,594	592,070	654,360
Ice Cream (gals.)	140,932,268	127,810,204	122,900,106
Dairy By-products			
Whey Butter	3,083,665	5,597,308	5,510,213
Renovated Butter	7,528,196	12,188,779	19,257,322
American Skim Cheese	10,708,833	6,985,356	6,610,993
Cottage, Pot and Bakers' Cheese	29,037,796	29,785,329	27,802,037
Dried Casein	10,492,736	13,924,836	8,755,100
Powdered Skim and Buttermilk	46,081,944	38,354,958	29,773,164
Condensed and Evaporated Skim and Buttermilk	182,168,867	130,630,363	130,322,099
Milk Sugar	4,733,614	6,615,874	2,749,928
Imitation Dairy Products			
Filled Milk*	85,581,787	65,010,345	48,625,037
Oleo (combined animal and vegetable oil)	174,601,104	224,061,770	262,253,014
Oleo (animal oil)	4,581,904	4,556,569	4,309,535
Oleo (vegetable oil)	191,536,926	142,698,848	88,973,966
Total Oleomargarine	370,719,934	371,317,187	355,536,515

*Evaporated skimmilk and foreign (cocoanut) oil.

By computing the above tables on the basis of the amount of whole milk used to produce the several manufactured dairy products, it will be found that in 1920 there was slightly less whole milk used than in 1918 but the decrease from 1919 amounts to nearly three billion pounds, or the equivalent of the annual production of 750,000 cows. The most decided decline from the 1919 figures was in condensed and evaporated milk, amounting to over 50 per cent or about 2½ billion pounds of whole milk equivalent. The production of creamery butter declined about two per cent and American cheese about 16 per cent. Foreign type cheese increased slightly, but the only material increase was that of 15 per cent for ice cream.

Filled milk increased 24 per cent over its 1919 production and is nearly double the 1918 production, now amounting to 16 per cent of the production of evaporated milk. In 1920 it found a market for nearly seven million pounds of cheap cocoanut oil at very near the price of butterfat, and at the same time placed over eight million pounds of extra butter on the market to compete with the regular supply of creamery butter.

Oleomargarine just about held its own in total production, but animal fats lost materially in the increased product made from vegetable oils. The ratio between creamery butter and oleo still continues at about 2¼ pounds of the former to one of oleo.

Corn and Oats at Record Low Prices

SANDERS SOSLAND, MISSOURI

DAIRYMEN eager to reduce their feed bills can find encouragement in the market for corn and oats which are frequently termed the "key" feeds. In recent weeks the coarse grains have assumed their leadership in the downward trend of prices for feedstuffs, with the extreme weakness in the market for the coarse grains wielding tremendous pressure on the feed commodities in which the dairyman is interested.

The weak tone of corn and oats has extended over a period of several months, virtually since the opening of the 1920-21 crop year. Prices are now at the lowest level of the season; in the case of corn, values are down to the lowest point reached since November of 1912, and not since March of 1911 have oats sold on a more depreciated basis than on the current market. On most Middle West markets corn is selling at a range of 40 to 50 cents a bushel, and oats are between 32 and 36 cents a bushel. On the basis of the terminal quotations, producers are selling corn between 25 and 30 cents a bushel, with the net prices paid to farmers for oats between 20 and 25 cents a bushel. Less than a year ago, in June of 1920, corn sold up to $2 a bushel and oats were well above $1 a bushel on Middle West markets at that time, ranging up to $1.25 a bushel, the highest price on record.

The readjustment in corn and oats has been one of the most remarkable price movements in the history of agricultural markets. Having already witnessed the unexpected in price fluctuations, observers of the trade are hesitant to venture a forecast on the probable trend of values until another crop of the grains becomes available. For a considerable period there was strong buying support in the coarse grain market on the theory that values had declined sufficiently and were as low as warranted. However, operators have since learned that prices, though already low, can easily go lower. With most of the important commodities at extremely low price levels and still tending downward, sentiment of the trade in the coarse grains is naturally friendly to the bearish side of the market.

Outstanding among the influences making for weakness in corn and oats are the abnormally large visible stocks in the United States. The stocks of corn at terminals amount to approximately 33,000,000 bushels, compared with 5,500,000 bushels a year ago, 2,350,000 bushels two years ago, 17,500,000 bushels three years ago, and 10,500,000 bushels at this time in 1917. The oats holdings are relatively as great, amounting to 33,400,000 bushels, compared with 8,000,000 bushels a year ago and 21,000,000 bushels two years ago. These enormous stocks of corn and oats have been accumulated by elevator operators on markets and their purchases hedged or re-sold in the future pits. For example, the elevator operator has been able, because of the wide discount on the cash under the future quotations, to buy the actual grain on the cash market, place the grain in the elevator for storage, and sell a similar quantity to speculators in the future pits at a price sufficient to cover storage and interest charges and then permit of an excellent profit for the handlers. The speculator bought future corn, not with the idea of demanding delivery, but with the hope that he would later be able to re-sell his purchase at a substantial profit. However, no cash demand has developed from the actual consuming trade, including feeders, corn products industries, and other buyers, and elevators are naturally preparing to unload their millions of bushels to speculators on the future contracts. Without any prospect for a consumptive outlet, it is apparent that the market is in an extremely bearish position.

Little coarse grain is moving from farms, yet the fact remains that even the insignificant offerings available from day to day are more than the trade can absorb, with the result that prices remain sufficiently attractive to permit purchases by elevators on a hedging basis. The producer is keenly disappointed over prices and is refusing to sell. But the trade realizes that stocks are of enormous proportions on farms, the largest on record for this period of the year, and belief in the possibility of a heavy carry-over into the new crop year as a result of the holding tendency by farmers tends to stimulate selling pressure on markets. There is an enormous supply of feeds other than corn and oats, and favorable weather and excellent pasture conditions as a rule are further restricting the demand for the grains.

Cattle and sheep prices offer no great incentive for strengthening corn. One of the prominent features of the trade in cattle is the repressive influence of tight money on the purchase of stockers and feeders. Naturally, with prospective feeders unable to acquire the number of cattle they desire owing to the lack of credit, consumption of corn and other feedstuffs will be held in check. In the hog market, declining wages at industrial centers are affecting prices of the fed animals. However, hog feeding is still attractive. Offsetting this in a measure is the moderateness of the supplies of hogs on farms.

Another influence must be considered in the prospective trend of corn and oats prices. The cotton belt, ordinarily an enormous consumer of the coarse grains, particularly at this season and well into the summer, is buying very sparingly. Depression in cotton and the resulting serious credit strain have reduced sharply the purchasing power of the southern planters, and they are now buying on a smaller scale than in many years.

Easy to Make up Jell-

For making the newest things desserts and salads, Jell-O is bei used by the best cooks as well as women in millions of homes who all of the work about the house well as the cooking.

Cooks use Jell-O because it is mo satisfactory than anything else f the finest desserts and salads.

Women generally use

JELL-O

first of all, because better things ca be made of it, at the price, tha anything else.

In homes of the well-to-do Jell- is popular because it is too good "go without."

With people of moderate mea it is a part of the noon-day or ev ning meal regularly for the reaso that it costs only a few cents an can be made up into the most del cious and beautiful desserts an other dishes by any woman, cook o no cook.

Jell-O is sold in all grocery store and general stores, 2 packages fo 25 cents. There are six different fru flavors: Raspberry, Strawberry Lemon, Orange, Cherry, Chocolate

The new Jell-O Book describe new Jell-O salads, "whips," knick knacks, and dainties of almost un limited variety. Recipes for every day salads and desserts are give first place in it, and particularly th new things in fruity Jell-O dessert A copy will be sent to you free if yo will send us your name and address

Have you talked with your neighbors about subscribing for Hoard's Dairyman? Why not do it now? Make up as large a club of subscribers as you can and send them in.

Corn chop manufacturers, many of whom are almost entirely dependent upon the South as an outlet for their products at this season, have been forced to shut down for lack of buying power. Mixed feed manufacturers who use large quantities of corn in their commercial products and who have developed a large southern trade also are operating on a very small schedule. The export demand for both corn and oats also is insignificant.

An extremely bearish attitude toward the prospective trend of prices for the feed grains in view of the abnormally low level already prevailing is no longer advisable. Yet the position of the market is of such a character which offers little hope that sufficient buying power can develop to cause any material rallies in prices or even halt abruptly the declining trend. Somewhat lower prices are probable when elevators begin to make corn and oats deliveries.

Books by Parcel Post

HOARD'S DAIRYMAN:—As we have come to look to Hoard's Dairyman for clarifying discussion of other matters regarding the farmer's family beside the income through the medium of his cow, I wish the courtesy of your columns for a partial analysis of the possibilities of the rural delivery in its daily service to its 30,000,000 patrons. There is many a service that the rural delivery might well perform to the joint benefit of farm home and postal revenue, as well. One tremendously vital use might be the transportation of public library books at times when the farmer, his wife, son, or daughter wish to borrow and return a book, but when the trip of two, four, or even eight miles to town cannot be made. How foolish that this great and growing class of convenient parcels should be virtually excluded by the inadvertent working of the local rate. Thus it now would cost five, six, or seven cents each way to borrow or return a book just from the village. No one will pay that much, the farm home loses the reading, and the rural delivery its revenue.

What the National Grange, the Farm Bureau, and the American Library Association are now asking is simply that we have the privilege of borrowing by mail from our nearest library at, say, one, two, or three cents each way. This would be above the cost of handling, figured at two cents a parcel for all parcels big and small, all shapes and sizes, handled by the post office in a year. It would take up a slight per cent of the slack in the rural mail service, now a dead loss and would give, as no other means can, the privilege of daily library service at the farmer's door. Could anything be more sensible?

In contrast to some other theories of utilization of the rural delivery, this works and would meet a popular demand. I have proved this out on the ground, not theorizing in a city office, and have tried it out (with complete success) in a typical farm section. When this matter comes up at Washington may we not have the support of every farm man and woman who wants cultural equality for their boys and girls with the young people of city and town?

New York. ALFRED L. SPENCER.

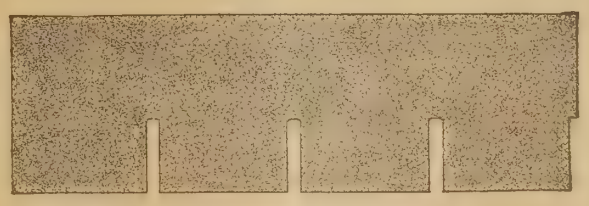
Mississippi Creamery Men Meet

The Mississippi Creamery Association recently held its sixth annual meeting at the Mississippi Agr'l. College, H. F. McWilliams was elected president for the forthcoming year; A. G. Brush, vice-president; and L. S. Edwards, secretary and treasurer.

In a butter scoring contest samples from about half of the creameries of Mississippi were scored by Professor M. Mortenson of Iowa, Mr. Clevenger of the U. S. Department of Agriculture, and Mr. L. S. Edwards. They pronounced the average quality of the butter to be superior to that in the creamery sections of the Northwest. The Mississippi Co-operative Creamery of Brookhaven was awarded the highest score.

Professor Mortenson addressed the association on the subject of creamery management in its relation to the consumer, the producer, and the manufacturer. He emphasized particularly the profits from the production of a high quality product, drawing numerous illustrations from his wide experience in manufacturing work.

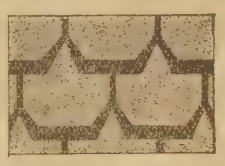
J. H. McClain, formerly of the U. S. Department of Agriculture, told of the ways in which a creamery can serve its patrons. He showed the wisdom of a creamery maintaining its plant in the most sanitary condition as an incentive to its patrons to adopt improved methods on their farms.



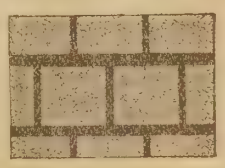
R. S. Wilson, Director of Extension in Mississippi, called attention to the work which that department is doing in bringing in good dairy cattle, in promoting bull associations, and in encouraging better feeding of dairy cattle.

P. C. Cromer, State Dairy Inspector, reported on the conditions found at the present time in Mississippi dairies.

Mr. Clevenger compared the progress of creamery work in Mississippi with that in other southern states and warned his hearers that Mississippi must continue to make progress to keep in the lead of other states.



Mississippi. J. S. MOORE.



MULE-HIDE Four-Unit Asphalt Shingles.
Easier to lay; made in red or gray-green slate surfaces. Size 10 x 32 inches; 112 strips to the square.

MULE-HIDE Shingle-Craft Roll Roofing.
Especially recommended for use over old wooden shingle roofs. Made in the Cut Shingle design and the Square Butt, as indicated.
Both designs may be purchased in either unfading red or gray-green slate, and in the Vertical or Horizontal style.

MULE-HIDE Smooth-Finish Roll Roofing.
Makes good, tight roofs—any building with a sloping roof. Made in three different weights—Extra Heavy, 60 lbs. per square; Heavy, 50 lbs.; Medium, 40 lbs. Directions for applying, with Nails and Cement, packed in each roll of MULE-HIDE Roofing.

MULE-HIDE Slate-Kote Roll Roofing.
Contains the same extra strength and wearing qualities as MULE-HIDE Smooth Finish Roll Roofing with the added advantage of its slate surface. In red or gray-green; Heavy, weight 90 lbs. per square; Extra Heavy, 115 lbs.

Why They Insist On MULE-HIDE

MANY, many property owners persistently buy MULE-HIDE. They won't accept any other roofing protection. Their insistence is based on their confidence in its additional protective power.

They have found that in the battle with the elements, MULE-HIDE has greater stamina, because it is "stronger and lasts longer"—less expensive because of its long life and freedom from repair.

Home and building owners appreciate the roofing with that remarkable service record:

"Not a Kick in a Million Feet"

There is a MULE-HIDE roof covering for every requirement, and your dealer will gladly show you samples of any of the following varieties.

MULE-HIDE Smooth Finished Roofing.
MULE-HIDE Slate-Kote Roofing furnished in Green and Red Slate.
MULE-HIDE Shingle-Craft Roofing furnished in Green and Red Slate.
MULE-HIDE Individual Asphalt Shingles in Standard and Double-Thick Weights furnished in Green and Red Slate.
MULE-HIDE Four-Unit Asphalt Shingles furnished in Green and Red Slate.
SEAL-SKIN and BLACK-BEAR Waterproof Building Papers.

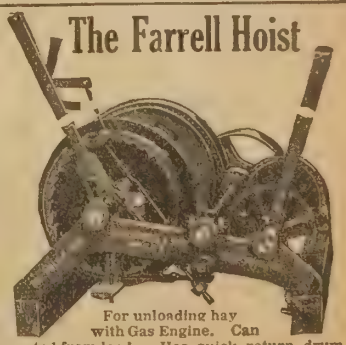
MULE-HIDE

Ready Roofings and Asphalt Shingles



Harris Governor Pulley Line Shaft Set

Enables you to run cream separator and all other machinery from one line shaft. Governor absorbs sudden jerks and shocks of engine—saves machinery, time, money. Simple, efficient, strong—no frail parts. Easily attached to floor, wall or ceiling.

Fully equipped to run 5 machines besides cream separator and mounted on substantial wood base for only $36.25. Smaller outfits, as low as $9.75. Each guaranteed 5 years. *Write for complete details.*

U. S. TRACTOR AND MACHINERY CO., 644 6th St., Menasha, Wis.

The Farrell Hoist

For unloading hay with Gas Engine. Can be operated from load. Has quick return drum and band brake. Price right. For information address
JOHN FARRELL & SON, Newton, Sussex Co., N. J.

Larro

The Ready Ration For Dairy Cows

The Cheapest Feed you can buy

Which is the feed for you to use?

The feed for which you pay the least money?

Or the feed which produces biggest profits?

Figure it out for yourself. You may save three or four cents on a cow's daily feed with a low price ration.

Or you may get one, two, or three quarts more milk every day with Larro.

Which pays best?

Write us for names of successful dairymen in your neighborhood who use Larro because it's the cheapest feed they can buy —the feed for biggest profits.

Association Notes

Kent County Co-operative, Michigan:—One of the members purchased a very good registered Holstein bull. March market milk, testing 3 per cent, sold for $3.20 per cwt. The condensery paid 56c per pound for fat and the creamery, 46—53c. Milk retails for 15c per quart and butter 50c per pound. Oats sold for $30 per ton; corn meal, $30; oil meal, $50; cottonseed meal, $45; Unicorn, $45; barley, $40; silage, $7; clover hay, $15; timothy hay, $10—$12; corn stover, $8.

DuPage County, Illinois:—One member bought a pure-bred bull to head his grade herd; another member purchased his first pure-bred cow. Two pure-bred cows were sold for breeding purposes and 17 grades were sold for dairy purposes. Considerable official work has been done during the past month by members of this association and two outstanding records were made. Yma Pearl Pontiac, owned by W. A. Rogers, made 24.89 lbs. butter in 7 days at 7 years of age. Illiona Alcartra Belle Pontiac 2nd, owned by A. W. Fischer, milked 29 days in March and made 1,548.6 lbs. milk containing 83.6 lbs. fat and later made an official record of 471 lbs. milk and 26.20 lbs. butter in 7 days. This was done at the age of 2 years 10 months. A number of the members are getting consignments ready for the Illinois State Holstein Sale to be held May 6th and 7th. Market milk, testing 3.5 per cent, sold for $2.35 per cwt. and 4 cents were paid for each point above. Milk retails for 14c per quart. Feed prices are: hay, $25 per ton; silage, $6; corn, $25; oats, $28; barley, $35; bran, $28; cottonseed meal, $38; oil meal, $44; gluten, $40.

Lake County, Illinois:—Mr. L. G. Hutchings sold 14 head of good pure-bred Holsteins at $4,500. Thornbury Farm finished two semi-official records during the month with 846 lbs. butterfat and 676 lbs. butterfat. One of John Nichol's pure-bred Holsteins produced 71 lbs. of milk a day from a three-quarter udder. This is the third month she produced more than a ton of milk per month. She gave over 600 lbs. in 7 days on official test. During March market milk testing 3.5 per cent sold for $2.35 per cwt. and 4c for each point above. Silage sold for $8 per ton; hay, $18—$24; corn and cob meal, $18; ground oats, $26; bran, $27; cottonseed meal, $40; oil meal, $48.

Macoupin County, Illinois:—Adjie Inka Countess, a pure-bred Holstein owned by F. J. Slivka, is high cow this month for the third month in succession. When fresh she made an A. R. record exceeding 28 lbs. of butter in 7 days. During the month, 10 unprofitable cows were sold and one pure-bred bull was purchased. The average cow produced 55½c worth of milk per day and her feed cost 35½c. During March market milk sold for $2.23 per cwt. Three cents were paid for each point above 3.5 per cent, the required test. Alfalfa hay sold for $25—$28 per ton; clover hay, $23; silage, $6; soy beans, $23; oats, $18.60; bran, $1.50—$1.70 per cwt.; cottonseed meal, $2; oil meal, $2.80; brewers grains, $2.40; hominy, $1.50; corn, 50c—70c per bushel; oats, 50c.

First Rock Island County, Illinois:—Five unprofitable cows were sold during March. All herd averages are higher than in February due to the feeding of balanced rations; nearly all herds are receiving balanced rations. One pure-bred Holstein bull was purchased by W. H. Newton, Jr., and another pure-bred Holstein bull was purchased by Carl Crampton. One carload of alfalfa hay was purchased co-operatively with good results. The creamery paid 47c per pound for fat. Milk retails for 12c—13c per quart; butter, 45c per pound, and cheese, 40c per pound. Bran sold for $30 per ton; cottonseed meal, $34; oil meal, $42; gluten, $48; alfalfa, $24; corn stover, $2.25; prairie hay, $14; clover, $22; silage, $6; corn, 63c per bushel; oats, 45c.

Elkhorn—East Troy, Wisconsin:—One more herd is on the accredited list. The average returns for each dollar expended for feed was $1.70. The average feed cost of a pound of butterfat was 37c and $1.38 for 100 lbs. of milk. Six cows were sold because they were found to be reactors

when tested for tuberculosis. Four more cows made over 20 lbs. of butter on 7-day A. R. O. test. Sixteen unprofitable cows were sold during March. Market milk testing 3.5 per cent sold for $3.20 per cwt. and 4c for each point above. The condensery paid 56c per pound for fat and in addition 25c per 100 lbs. milk. Milk retails for 12c per quart and butter for 52c per pound. During March bran sold for $26 per ton; middlings, $26; brewers grains, $34; oil meal, $43; gluten feed, $46; alfalfa meal, $30; hominy, $27; silage, $6; mixed hay, $22.

Amery, Wisconsin:—Four unprofitable cows were sold and three pure-bred Holstein cows were brought into the association. All members deliver cream to the creamery.

Delaware County, Ohio:—Last year 37 "boarder" cows were sold and 15 pure-bred cows and heifers were added. Four pure-bred sires were added during last year. Two have been added already this year. Milk retails for 14c per quart and butter for 55c—58c per pound. During March bran sold for $38 per ton; oil meal, $52; cottonseed meal, $42; corn, 50c per bushel; oats, 35c.

Posey—Gibson, Indiana:—Two Guernseys are on A. R. test. One Guernsey in Robert Black's herd finished her test with 576 lbs. fat, Class B. which makes her state class leader. Seventeen per cent of the cows on test produced over 40 lbs. fat. During March, 4 per cent milk sold for $3.20. The creamery paid 39c—43c per pound for fat. Milk retails for 15c per quart; butter for 45c per pound and cheese for 35c per pound. Corn and cob meal sold for $18 per ton; bran, $30; oats, $30; cottonseed meal, $45; hay, $15; silage, $7.

Tillamook, Oregon:—The Tillamook Association started its tenth year with many new members, there being 48 herds entered and over 1,100 cows, with bright prospects for a few more herds. Cheese has not taken a slump here as yet and at present the cows are being pressed to the limit.

East Aurora Dairy Improvement Association, New York:—Several new members will be taken on during the month of April. In a recent drive by city milk distributors to improve the quality of the milk shipped to them, dairy improvement work proves its value as a means of discerning which cows are desirable from a fat producing standpoint, and the elimination of the low producers gives a much more satisfactory herd average. During March, market milk testing 3 per cent sold for $2.38 and 4c was paid for each point above. The creamery paid 50c—55c per pound for fat. Milk retails for 9c per quart; butter, 58c per pound; and cheese, 37c per pound. Hay sold for $20 per ton; silage, $6; gluten feed, $45; ground oats, $42; corn meal, $38; wheat bran, $36; oil meal, $48; cottonseed meal, $45.

Salem County, New Jersey:—Three silos have been purchased and two farmers have installed drinking cups. A bull association has been organized consisting of 4 blocks. A young bull sired by Sir Inka Prilly Segis and out of the highest record junior two-year-old of King of the Pontiacs was recently purchased by S. L. Moore for $2,000. Corn and cob meal sold for $26 per ton; gluten feed, $48; linseed oil meal, $52; beet pulp, $40; brewers grains, $40; cottonseed meal, $43; distillers grains, $48; bran, $36; hominy feed, $35; molasses, $11 per barrel; mixed hay, $20—$25 per ton; clover, $24—$28; alfalfa, $26—$30.

Canaan, Connecticut:—During March 25 scrubs were sold and replaced by profitable cows. The members of this association are feeding their herds better and the number who mix their own balanced rations is increasing. Market milk testing 3 per cent sold for $2.25 per hundred pounds. Stock hay sold for $20 per ton; silage, $8; bran, $42; gluten, $45; cottonseed meal, $45; oil meal, $49; beet pulp, $40; hominy, $40; oats, $40.

Fairfax, Virginia:—This association began September 1, 1920. Three hundred and one cows were tested that month, while 398 were tested in March, 1921. The average production per cow in September was 518 lbs. milk and 20.7 lbs. fat. In March the production was 580 lbs. milk and 24.8 lbs. fat. Since September 1st, 29 poor cows have been sold. Only one scrub bull is used in the association. Seventy of the 398 cows tested in March are pure-breds. The members of this association making the most money are those that give the best individual care to each cow. One member of the association took charge of a herd four years ago where the cows produced only 2,500 lbs. milk per year each. Some of these cows were sold, but he still has most of them, and by proper treatment has raised the production to 8,000 lbs. per cow per year.

Claremont and Lebanon, New Hampshire:—Due to the fact that Lebanon passed an ordinance requiring all milk sold to be from tuberculin tested cows, a large amount of accredited herd work has been done since that time. At present all money appropriated by the state has been spent so the work has been discontinued. During March, market milk testing 3.7 per cent sold for $3.50 per hundred lbs. Milk retails for 12c per quart and butter for 60c per pound. Bran sold for $40 per ton; cottonseed meal, $42; oil meal, $53; corn and cob meal, $30; ground oats, $40; corn meal, $34; silage, $9; mixed hay, $20.

Lebanon Valley, Pennsylvania:—During the month of March, 8 unprofitable cows were sold. One pure-bred bull was purchased, replacing a grade. Pure-bred cows were introduced into two herds. Market milk, testing 3.5 per cent, sold for $1.95 per hundred lbs. and 4c were paid for each point above. Milk sold for 10c per quart and butter for 65c per pound. Feed prices are: Unicorn, $58 per ton; bran, $40; cottonseed meal, $40—$50; oil meal, $55—$60; corn, $20; oats, $30; gluten, $50—$60; Larro, $58; silage, $8; hay, $18; beets, $10; corn stover, $5.

Oneida County, New York:—June 2nd the registered Holstein two-year-old, owned by Clifford Gallup, produced in 5 months approximately 6,115.7 lbs. milk and 201.3 lbs. fat and at the present time is milking around 40 lbs. per day. Clifford is only 15 years of age and he raised this heifer and has milked and fed her during the time she has been on test.

Rosendale-Eldorado, Wisconsin:—During the month of March 19 cows were sold. Thirteen were sold for dairy purposes and 6 for beef. Market milk testing 3.4 per cent sold for $1.82—$2.02 per hunderd pounds and 4c for each point above. The condensery paid $2.08 per hundred lbs. for milk. The creamery paid 54.4c per pound for fat. Feed sold as follows: oil meal, $46 per ton; gluten, $42; bran, $30; Wisconsin Balanced Ration, $45; oats, 32c per bushel.

West Branch-Tri County, Iowa:—Market milk sold for $2.80 per hundred lbs. The required test was 3.5 per cent and 8c were paid for each point above. The creamery paid 80c per pound for fat. Milk retails for 14c per quart and butter for 15c per pound. Corn sold for $20 per ton; oats, $30; bran, $32; oil meal, $55;

Gift Corn on Way

Two solid trainloads of shelled corn, given by the farmers of America to relieve the starving children of Europe and the Near-east, started from Chicago last week for eastern mills.

Oneida Holsteins Average $425

HOARD'S DAIRYMAN:—The late sale in New York of the Oneida Community herd of 145 high class pure-bred Holsteins was a notable event among eastern Holstein breeders. The highest prices were received that have been noted in this territory for over a year. The sale was out of the ordinary in that nearly every animal dispersed had had official butter and milk records made.

Buyers came freely from other states and a spirit of confidence in the stock's quality prevailed. Few herds can show so splendid a health record, every animal being sold on a 60-day retest guarantee. The herd was built up by H. V. Noyes, who was last year president of the New York State Holstein Breeders' Association and who was owner of the herd. M. G. Adams has been the manager of the farm.

The herd had been maintained to supply the community with milk. Officials found the care of pure-breds involved too much labor and, though these animals have made wonderful production records, they will be replaced with grades which do not require the maintenance of testing stalls and other forms of labor and expense.

Of the 145 animals sold 63 left the state, 82 remaining to help build up other herds of the state. They brought a total of $61,765, or an average of $425. The highest price paid was $3,000 and the lowest was $20 for a young calf.

Two families led in good prices that related to the foundation cow, Onyx Pledge Dawning who, with five daughters, five granddaughters, and her only male calf, brought $13,245; and the Jennie Grant family.

The heaviest state buyer was Maikenshof. The following is a list of animals that sold best with their buyers:

Maikenshof, New York	
Onyx Pledge Dawning	$3,000
Queen Gale Reliance	1,525
Twin sisters of this family	2,500
M. L. Jones, Pennsylvania	
Male calf of Onyx Pledge Dawning	$1,000
Jennie Grant De Kol 2d	1,120
Jennie Grant Lilith	700
Mountain View Farm, Maryland	
Onyx Pledge Alma	$2,600
Korndyke Viola Reliance	1,000
Jean Jerold Farms, Ohio	
Jennie Grant Aaggie	$ 660
Ten head went to this farm for	3,190
H. C. Shepard, New York	
Onyx Segis Reliance	$420

Illinois—Missouri Milk Producers' Association Organized

HOARD'S DAIRYMAN:—For some time the milk producers in Southern Illinois have realized that individually they have had very little bargaining power but collectively they have bargaining power on the level with that of the purchasing power of the dealers. This latter condition is important in order to make the law of supply and demand operate fairly and freely.

Secondly, the milk producers have realized that unless they themselves handle and take care of the surplus milk in the territory, the market price for milk cannot be stable.

During the last four months the milk producers co-operating with the Illinois Agricultural Association have been selling stock in the proposed co-operative milk marketing organization. The milk producers quickly saw the advantage of such an organization and have subscribed freely. In addition they have signed a contract agreeing to market their milk through this marketing organization for a five-year period. The capital stock of this marketing organization is $500,000. About 2,200 milk producers have taken at least one share at the par value of $100 in this co-operative milk marketing company, which means that about $220,000 has been subscribed. About 1,000 more than this number have signed the five-year milk contract.

On Thursday, April 14th, a subscribers' meeting was called to perfect the permanent organization. This meeting could have been called very early in the period of the stock subscribing campaign and the organization could thus have been controlled by a few of the men on the inside. It was, however, thought that as many milk producers and shareholders as possible should have a voice in the formation of the permanent company. This plan was carried out so as to make the organization strictly representative. The milk producers on the Illinois side were divided into five districts, each district having about an equal number of stock subscribers. The subscribers on the Missouri side were classed as one district. It was agreed that the Missouri producers should have two representatives on the board of directors and each of the other five districts on the Illinois side should have three representatives. These representatives on the board were nominated by the stockholders in each district. When this was accomplished there was full accord as to the personnel of the new board, and every milk producing section would be represented on the board. After the different districts had caucused and agreed on their candidates, a motion was made that the secretary cast a ballot in behalf of all the stockholders present for those nominees and they were elected unanimously to the board.

All of the various articles of the constitution and by-laws were gone over by the whole body of stockholders and after certain changes had been made all were unanimously adopted.

The personnel of the new board is as follows:

District one, including all of Madison and part of Bond Counties; D. A. Brooks, Fred Henke, and George Cassins.

District two, including Macoupin, part of Jersey, Greene, and Montgomery Counties: Horace E. Drennan, H. J. Schultz, and John Foster.

District three, including parts of Montgomery, Fayette, and Bond Counties: O. K. Allen, Percy Alexander, and W. J. Goers.

District four, including all of Clinton County and parts of Marion and St. Clair Counties: John Dousman, N. E. Baum, and Herman Imming.

District five, including Washington County, and parts of St. Clair, Jefferson, Randolph, and Perry Counties: John Koeningsmark, Fred Hemminghouse, and John Oaks.

District six, including all on the Missouri side of the river: A. S. Ennis and Abe Argent.

Two important things acted upon in connection with the by-laws as submitted by the organization committee were:

First, a change of the name of the association proposed by the by-laws committee. It was suggested that the permanent name of the Southern Illinois Co-operative Milk Producers' Association, on the request of the Missouri representatives, be changed to the Illinois—Missouri Co-operative Milk Producers' Association. Secondly, the stockholders increased the number on the board of directors from 11 to 17.

Mr. Fred Henke, chairman of the organization committee, called the meeting of the stock subscribers to order. Mr. D. A. Brooks was selected temporary chairman. Credential and resolution committees were appointed. Mr. Henke explained that the committee had in mind to district all of the milk producers so that every territory would be well represented. He also told of other important things included in the by-laws.

Professor Roy C. Potts, in charge of the dairy marketing work in the United States Bureau of Markets, gave a short talk. He said there were four things important to the success of this new marketing company, namely: first, there should be a desire to do; secondly, there should be right action and right plans; third, there should be ample finances; and fourth, they should select the best brains to manage the organization.

Mr. J. C. Sailor of the organization department of the Illinois Agricultural Association emphasized the importance of throwing away all personal desires and feelings. He said that if the organization was going to be a success and a model, all should assume the spirit of mutual service. He stated that the Illinois Agricultural Association was very anxious to see his marketing company a great success and would continue to do everything possible to assist along that line.

The very best spirit prevailed throughout the whole meeting. Everybody seemed to realize that an important enterprise had been undertaken.

The board of directors will meet shortly to elect their officers. It was authorized by the convention of subscribers to definitely incorporate and secure a permanent charter.

Illinois. C. LARSON.

Holstein Breeders Midland County, Michigan, Organize

The Holstein-Friesian breeders of Midland County, Michigan, met at Midland March 26th and completed the organization of the Midland County Holstein-Friesian Breeders' Association. Roy Walker was elected president; Chas. Lauphierd, vice-president; Erwin C. Smith, secretary-treasurer; and Geo. H. Bergtold, F. Trombley, E. L. Richardson, Earl Peters, and Chas. Barkley, directors. Probably the first project to be undertaken will be the organization of a calf club.

Much interest in the breed is being manifested and several non-members are already looking about for heifers as foundation stock. This is the first breed association to be formed in the county.

Michigan. ERWIN C. SMITH.

Two New Guernsey Class Leaders

California has a new Guernsey champion in class CC. Escalon Princess 62332, owned by A. B. Humphrey has completed a record which gives her ninth place in this class.

Governess Louise, owned by Mr. F. J. Rueping of Wisconsin, has completed a record of 14,198.3 pounds of milk containing 800.74 pounds of butterfat in class C. She is by Imp. Cora's Governor of Chilmark 8971. Fifty-nine records made by forty-four daughters of this bull average 472.08 pounds of butterfat.

More money should be spent for fruits, vegetables, and milk, and less spent for "spring tonics".

Wisconsin Filled Milk Hearing

Filled milk must go. This was the sum and substance of the testimony given before the committee of the Wisconsin Legislature that has in charge a bill that forbids the manufacture and sale of condensed skimmilk to which a foreign fat has been added. The bill was proposed primarily to prevent fraud and to protect the health of consumers. The testimony was convincing as to the fraudulent sale of the imitation product and also as to the danger to public health. The concern of the producer was held to be secondary to that of the consumer, but the producers' interest was held to be vital, that it was a case of the cocoanut cow vs. the dairy cow of Wisconsin, a case of the cocoanut farmer of the South Sea Islands vs. the dairy farmer of Wisconsin.

In presenting the case of fraud, Mr. Cramer testified that he had visited 35 stores in Milwaukee, Racine, and Kenosha where the imitation product was sold. In only one instance was it sold as a compound, in every other case it was sold as evaporated milk. In many cases the prices for the imitation product and the genuine were the same, and in no case was the filled milk sold at more than two cents a pound less. In some cases the request for evaporated milk was complied with by handing over a can of filled milk with a statement that it was the best. In one case the clerk even went so far as to say, "Hebe milk is more like fresh milk than Carnation milk."

Mr. Cramer substantiated his case by presenting to the committee the cans of filled and genuine milk, together with the purchase slips. His testimony was reinforced by that of other gentlemen appearing before the committee and also by newspaper advertisements in which the filled article was advertised as milk, establishing the case of fraud. The question of health was next presented in most convincing manner by Messrs. Glover, Hart, and Fisher. The nature of this testimony as to the value of the fat soluble vitamine is well known to readers of Hoard's Dairyman, so we give only one or two high points.

Dr. Hart of the Wisconsin College of Agriculture, under whom much of the McCollum work was done and who stands as an authority on nutrition, gave a most excellent exposition of the necessity of such legislation as that called for. Among other things, he scotched the argument that skimmilk contained this vitamine to any considerable degree. He said that it did not contain over one-tenth, and probably not one-twentieth of the vitamine in the original whole milk.

Dr. Fisher of the University of Wisconsin, food chemist of note, also gave unqualified endorsement to the proposed bill. He drew attention to the fact that the cocoanut oil was a refined, deodorized product made from rancid material that must be chemically treated.

Mr. K. L. Hatch brought to the attention of the committee that the makers of filled milk were a privileged class under the law, as they were permitted to abstract milk fat and sell an imitation product, whereas the cheesemaker cannot separate his milk and then add foreign fats to make cheese; the farmer and retailer of milk are not permitted to skim milk and add foreign fat. "As a farmer," he said, "I only ask that these manufacturers of filled milk be placed under the same restrictions I am, or that the restrictions on my actions be removed."

Mr. Hatch also showed the absurdity of the claim that filled milk was a cheap substitute for cooking purposes. There are two kinds of cookery in which milk is used. In one no shortening is needed, in the other more must be added than is found in filled milk. Mrs. Hatch supplied the committee with dishes made from filled milk, from powdered skimmilk, and from powdered skimmilk and butter. She showed the latter to be cheaper and better than the filled milk product, and defied the committee to tell the difference between the two first named dishes.

A representative of the women's clubs of the state said their organization would get back of the movement for they stood for health and honesty. She said people might eat too much of some foods, but she had never heard of any one getting too much vitamine and had seen many cases in which they got too small an amount.

The secretary of the State Dairymen's Association and Mr. Foster of the Walworth County Farm Bureau detailed briefly the economics as they affected the farmer. They showed that the makers of filled milk did not create a market for the farmers' skimmilk, but did create a market for cocoanut oil in place of butterfat, put additional butter on the market, and was a serious detriment to the dairy industry. They held that filled milk was not a dairy product, that it was a manufactured compound, and that like filled cheese it was a damage to the dairy farmers of the state. This imitation product had doubled in production in the past two years and had increased to alarming proportions, last year seven million pounds of cocoanut oil displacing a like amount of butterfat in evaporated milk and in addition placing eight million pounds of extra butter on the market that competed and lowered the price of creamery butter. If the present ratio of increase is continued, it would not be long before the small creameries of the state would be forced out of business and practically all good butter would be manufactured by the condenseries, prices of milk would fall to a low level, and the producers would be largely at the mercy of the large business units or forced out of business.

Mr. Foster said: "The enthusiasm of the manufacturers is easily explained. To make 100 lbs. of genuine evaporated milk takes about 210 lbs. of whole milk. At $2.10 a hundred, the present Wisconsin price, the milk costs the manufacturer $4.41. To produce 100 lbs. of filled milk requires about 215 lbs. of skimmilk and 7.8 lbs. of cocoanut oil. With skimmilk at 25 cents a hundred, the price some Wisconsin condenseries are now paying, and with cocoanut oil at 15 cents a pound, the cost of one hundred pounds of the imitation product totals only $1.70." "I, too, would get enthusiastic," said Mr. Foster, "if I could see a difference in price of $2.71 in the cost of making one hundred pounds of my product. I, too, could take an extra profit in its first sale and give every handler a nice additional profit that would induce them to push the product onto the unsuspecting consumer at a price in some case equal to and in all cases only slightly under the price of the genuine."

Closing the case of the proponents of the bill came Wisconsin's grand old fighting Dairy and Food Commissioner, J. Q. Emery. He devoted himself almost entirely to the legal phases of the question and the constitutional right of the legislature to act. He quoted from the Supreme Court decisions and from other courts, leaving no misunderstanding as to the right, power, and duty of the legislature to outlaw filled milk as a fraudulent product inimical to public health and damaging to the producer of milk.

New York Dairy Notes

A grain elevator and mill owned by the Grange—League—Federation Exchange burned on April 16 in Buffalo. The loss followed an explosion and amounts to $250,000. Dairymen will feel this loss keenly though the building and contents were pretty well covered by insurance. It cannot but interfere temporarily at least with the immense feed business with dairymen. The Exchange has a warehouse in Syracuse and efforts will be made to carry on the business which has amounted to over one and a half million dollars since January 1.

Tompkins dairymen will refuse to deliver milk to the Nestle's Food Company of Ithaca which opened recently after being closed since October 1. They have seen to it that only 1,000 lbs. of milk is delivered as compared to about 60,000 daily last fall. The company has been very unfair to the dairymen, according to their belief, and it is probable that the firm's expensive new plant at Ithaca will have to be sold or junked. Dairymen are getting more competent to protect themselves and expect to become more so as pooling is worked out. Last week the company's representative, Mr. Rowe, met a representative of the League in a debate in the presence of the dairymen of two counties. It seems that no truce was made as the firm refused to recognize the League in any way, though it would pay League prices in order to get the milk wanted. Spencer farmers on the southern boundary of the county voted this week to have nothing to do with Nestle's and will send their milk to Erie, Pa., where a plant is located that recognizes the League officially. Not a ballot was cast in favor of the Nestle firm.

The plan of giving the tuberculin test to all dairies of Tompkins County was held up temporarily for lack of funds. A county veterinarian has been employed and the herd owners pay him and his expenses. Federal funds were not available and state funds will pay the indemnities. Of the first 177 animals tested but 27 reacted. A federal veterinarian was on hand to get the work started. Cortland County is now to join the number of counties doing this work.

The Home Bureau of Syracuse, under Miss Edith Barber's capable management, is to put on a campaign the first week of May to increase milk consumption. She will be assisted by several welfare organizations. The Jolly Jester, clown, will succeed Cho-Cho of last year's campaign. The Jolly Jester is a ventriloquist and gets music out of a milk bottle which, with information as to what is best for children to eat, he will dispense to twelve schools of the city and to the crowds about the milk bar. The Onondago County Holstein Club has voted funds to assist the campaign. Last year a similar campaign increased the use of milk in the city 25%, it was said. It would seem that dairymen have every worthwhile agency working in their interests merely on the pure merits of milk as a food. Very little concerted action on the part of dairymen in the direction of sustained advertising of the valuable food ought to double or treble its use if fair retail prices prevail.

KING PONTIAC SEGIS LAD DE KOL, THE GRAND CHAMPION HOLSTEIN BULL AND WINNER OF THE $500 PRIZE AT THE BRENTWOOD SHOW HELD IN CONNECTION WITH THE SECOND BRENTWOOD NATIONAL SALE

By error this winning was credited to another bull in the April 8 issue of Hoard's Dairyman. The grand champion was consigned by R. M. Harriman, Wisconsin, and purchased by Baynewood Farms, Michigan, for $2,700.

The New York State Fair has set a precedent in offering a cash prize of $500 to the best state exhibit of cattle to be shown at the national cattle sale to be held in conjunction with the annual meeting of the American Holstein Association in Syracuse on June 2, 3, and 4. The breeders of the state will not compete, however, for the $500 prize offered by their state fair, as they are the hosts at the event. They are busy making arrangements to insure this being the biggest sale ever held in the East. California is to send two carloads of cattle. Michigan and Minnesota have their consignments nearly ready. Canada will send fifteen animals and New England 20. New York's quota is 40.

New York. E. G. FEINT.

For Barrenness in Cows, Mares and Sows, Use Hood Farm Breeding Powder

Astonishing Success in Making Barren Animals Breed — Indispensable After Abortion — Invaluable Where Cows do not Clean — Profitable to use on Every Cow After Calving.

Read what they say:
Hood Farm Breeding Powder is great and has been a God-send to me. I cannot be without it.
SULZER BROTHERS,
R. F. D. No. 2, Box 42, Hillsdale, Ore.

I have been using your Breeding Powder for eight years, when needed, and am well pleased with it.

The "STAY THERE" Aluminum Ear Markers
are the best. Being made of aluminum they are **brighter, lighter, stronger and more durable** than any other. Fit any part of the ear. Nothing to catch on feed trough or other obstacle. Your name, address and any series of numbers on each tag. **Sample tag,** catalog and prices **mailed free.** Ask for them.
Address Wilcox & Harvey Mfg. Co., 568 W. Randolph St., Chicago, Ill.

Shear the Modern Way

Old methods of shearing leave too much wool on the sheep. Shear with a Stewart Machine — leaves no second cuts and does not scar the sheep.
Machine shearing is quicker and easier—no tired arms or sore, swollen wrists.
Machine shearing is better. The wool comes off in one unbroken blanket, with long, even fiber, and brings best prices.
For flocks up to 300 head, buy the Stewart No. 9, ball bearing. Hand operated—easy running. $22 at your dealer's, or we send it on receipt of $2, you pay balance on arrival.
Write for Catalog No. 69 if you have an engine or are interested in power operated machines.
CHICAGO FLEXIBLE SHAFT CO.
Dept. 156 5600 Roosevelt Road, CHICAGO

VETERINARY

Advice is given free in this department. Inquires must be signed by the writer, and should pertain to veterinary Matters only. Where an immediate reply and prescription are desired by mail, the inquiry must be accompanied by a fee of one dollar. In every instance it will be necessary to give a full description of the symptoms present.

Fistula of the Teat

A false duct or fistulous tract through which milk flows or leaks at milking time would be less common were wounds of the teat properly attended to at time of occurrence. Often the attendant merely washes a barbwire tear when the cow comes up from pasture and then applies axle grease which is none too clean. The wound then heals imperfectly and leaves a fistula. The chief cause is presence of foreign bodies such as sand, dirt, manure, or shreds of skin left in the wound. To prevent infection and formation of fistula the wounded teat should at once be immersed in hot water containing all the boric acid it will dissolve. Then every particle of foreign matter should be removed and shreds of skin cut away. This done, it is a mistake, as a general rule, to put stitches (sutures) in the wound. That can only be done with safety by the trained veterinarian and he should, if possible, attend to every valuable cow. Instead of suturing the wound he may consider it best to insert a sterilized milking tube in the duct and then proceed to bandage the teat spirally with surgeons' tape over a dressing of antiseptic powder. If the wound is made perfectly clean and fresh and has been freed of germs and foreign bodies, healing should then take place by "first intention" and that is found to have occurred when the bandage is removed in 10 to 14 days, after soaking the plaster with alcohol. A narrow strip of antiseptic gauze may be used in like manner and kept in place by means of pine tar. That is good treatment for a fistula of the teat after operation.

To do away with a fistula of the teat wall treatment should be given when the cow is dry. It is possible when she is in milk, but chances of success are greatly lessened by milk flow. Treatment consists in perfectly restraining the cow, soaking the teat in a hot saturated solution of boric acid, inserting a sterilized milking tube and then making a new, fresh wound of the fistulous tract by cutting with a small sharp scalpel or using a sharp curetting instrument. Then the blood flow has to be stopped, or practically so, and the wound swabbed with tincture of iodin, or dusted with iodoform after which a bandage is applied. For that purpose some use a strip of surgeons' plaster or tape or even a strip of porous plaster applied spirally from the tip of the teat to the udder. A simpler and effective covering for the teat is formed by coating the teat with pine tar, then winding on a 2-inch strip of antiseptic gauze from the tip of the teat upward, the milking tube being kept in place, and then covering the first and each successive layer of gauze with pine tar. The gauze should be drawn fairly tight, but not so tight that circulation of blood will be caused. Enough turns of the gauze should be taken to form a strong covering and the cow should afterward be kept in a clean box stall to prevent loosening or soiling of the bandage. The last turn of the bandage may be stitched to the one under it and when the time comes to remove the bandage it should be saturated with alcohol. In most cases the bandage may be removed in 2 weeks but sometimes is left longer. Using a red hot knitting needle to cauterize the fistula is not good practice.

Obstructed Teat

We have a registered Jersey heifer which freshened January 30 and milked all right until about eight days ago. One milking, however, we noticed that the left front teat was extremely hard to milk. We have had to use a milk tube to open teat at each milking and it does not seem to get any better. The teat has not been injured and there is no obstruction within, but it seems to be wholly at the opening that the trouble is.
Demopolis, Ala. (Mrs.) G. W. W.

A teat plug should be left in the duct between milkings, and boiled for 20 minutes each time before insertion after milking. If that does not suffice, a veterinarian should be employed to use special dilators and may find it necessary to cut through the obstruction in four different directions by means of a teat bistoury. The milking tube will be certain to cause ruinous garget unless sterilized before use.

Disposal of Afterbirth

Which is the best, to let a cow eat the afterbirth or take it away?
Philadelphia, Pa. R. T.

A cow should not be allowed to eat her afterbirth. She is not a carnivorous or omnivorous animal so cannot digest such a substance and it has therefore to decompose and finally pass away. Cows are often seriously injured by eating the afterbirth.

Barrenness

I have a fine 3-year-old Jersey that had one calf last fall. I have bred her several times but fail to get her with calf.
Marshalltown, Ia. W. H. S.

As often explained here, there is no specific remedy for this condition as the causes are many and different, but as disease of the womb or ovaries, from contagious abortion germ-infection, is the commonest cause, treatment of those organs by a trained veterinarian is indicated in all cases. Until you can have that done, syringe out the vagina every other day with a gallon of blood warm boiled water containing 2 tablespoonfuls of table salt.

Have you talked with your neighbors about subscribing for Hoard's Dairyman? Why not do it now? Make up as large a club of subscribers as you can and send them in.

"PELOUZE" Dairy Scales
Three Sizes: 40, 60 and 120 lbs. by Tenths of a Pound.
Guaranteed Accurate
Made to comply with Departments of Weights and Measures. Large Circular Dial, with distinct, black figures and graduations. Patented adjustable hand for obtaining the tare weight of empty pail.

"In Every Respect" says the Good Judge

You get more genuine chewing satisfaction from the Real Tobacco Chew than you ever got from the ordinary kind.

The good tobacco taste lasts so long—a small chew of this class of tobacco lasts much longer than a big chew of the old kind. That's why it costs less to use.

Any man who has used both kinds will tell you that.

Put up in two styles

W-B CUT is a long fine-cut tobacco
RIGHT CUT is a short-cut tobacco

Weyman-Bruton Company, 1107 Broadway, New York City

Back to the Friendly Farmhouse

(Continued from page 625)

necessities removed from each other where possible—to make the labor doubly hard, I suppose. The main reason for changing this old kitchen into our dining room, however, was the big fireplace and old brick oven which had been boarded up for, lo, these many years, forgotten and useless, behind more efficient stoves and ranges.

I had always abhorred large, inconvenient kitchens, so here was my opportunity. We converted it, together with a tiny bedroom and dark hall between the living room and old kitchen, into the long, large room intended for the new dining room, with the result that this is now 24 feet in length and 16 feet wide. The picture shows a part of its lightness and charm—an almost unbelievable contrast to the kitchen-that-was.

An unused milk room, ten by twelve feet only, was then turned into a kitchen on the east and adjoining the dining room, and here we cook and work as easily and quickly as does the machinist who stands at his wheel. Range, white sink, cabinet, table, work shelf, cupboards, cellarway, and convenient entrances to other rooms are arranged with efficiency and comfort in mind, and the steps taken in the performance of our duties are surprisingly few. By all means do I recommend the compact, handy kitchen for a large family—we are seven—if short shrift is to be made of work.

The remainder of our house at the back was converted into an annex to kitchen, a place where wood or coal, refrigerator, broom closet, oil stove, and laundry facilities are conveniently at hand. We now boast no pantries, no entries, no odd rooms for collecting junk down stairs. Each room is devoted entirely to its own purpose and serves it well. We cook in our kitchen, eat in dining room, read and rest in living room, and play in and entertain, and enjoy the parlor which is really another pleasant living room—wide open and inviting, through which we pass to reach the cool, shady eastern porch of afternoons.

Upstairs we found small, uncomfortable sleeping rooms in the main, the one exception being the big guest room shown in photograph, over the parlor below. This, with its cheery hearth, only needed old time chintz curtains and white paint to make it pretty indeed, the old four-poster, the old cradle, and the blue coverlid and blue knitted rugs giving the proper colonial feeling.

As in most old houses, there was a lack of bedrooms as only the main part of the house, the upright, had any; while the low ceiled attic was located over the long ell where we had wrought such satisfying changes in kitchen and dining room. So we proceeded to raise the roof of the ell and gain extra space much needed for a good sized bathroom and three more bedrooms. Meanwhile we had combined two little bedrooms upstairs in the main part, making one long, sunny southern room, all of which together proved sufficient sleeping quarters for our growing family. Each bedroom was papered tastefully, woodwork painted white, floors painted in neutral and spread with pretty rag rugs. The results are well worth while and demonstrate that money is not needed to effect charm and originality.

Inside the impossible had been accomplished, but not in a minute as this resume of mine may sound; and it was time to turn our thoughts to the bleak exterior as travellers past our door must view it.

To make a long story short, after the back part had been raised, doubling the upstairs space, we added two ten-by-twenty porches on both ends below, changed the windows formerly opening onto the new porches into big French doors, removed the long, rambling, fallen-in woodshed at the extreme rear of house, added windows wherever rooms were the least bit dark or cheerless, added hospitable little porticoes over all back doors (which do not show in picture), and finally ended up by painting the whole a colonial yellow with white trim, green window boxes gay with red geraniums adding the last touch. A brick walk bordered by spireas leads to the road.

We have lived in our new-old home for ten happy years. It is far from being perfection still, and in fact will probably never know the day when something cannot be added to make it more home-like and beautiful.

We attempted, and friends affirm with success, to change an old, old house lacking every modern convenience into a house young in feeling but old in its cherished memories, and we have tried to disturb these latter only where necessary for the sake of modern standards which experience has shown are right and necessary.

We were very careful to keep the fine lines of the old mantles, for instance, and to bring out their good points wherever possible. We opened up the fireplaces and kept the original floors and sought to add and never subtract from the really good points the house had to offer. Those which it so plainly lacked we tried to substitute, remembering that golden oak and "art squares" and cement walks and yawning windows of plate glass are in no way related to an old-fashioned home.

There is nothing so fascinating as to bring out the possibilities in our houses, whether they be of strictly modern feeling as the bungalow, or tending toward those earlier days of American history as does the dwelling of the writer. Farm women who seek to express themselves in their houses will never regret the time and money so spent. The friendly farm house, within and without, is only waiting to brighten the life of its fortunate mistress.

NATHAN CLOW, LA VERNE TAYLOR, WALTER WOOD, T. G. BROWN, COACH

This team, representing the department of vocational agriculture of the Oshkosh, Wis., schools, won the championship in judging dairy cattle at the state stock judging contest held at Madison, Wis., in February. It has been the custom to send the champion dairy team to the National Dairy Show to compete in the judging there.

When the Price You Get

is low, it is more important than ever to have your rate of production high. Clean, light, sanitary living-quarters, free from lice, mites and disease germs, are just as necessary as proper feeding if you expect your poultry and livestock to thrive and produce their best. Thousands of farmers get these very profitable, sanitary conditions and also save much of the time, labor, and expense it means to first whitewash and then disinfect, by using

CARBOLA
The Disinfecting White Paint

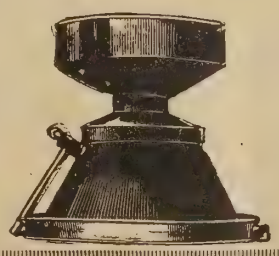
Instead of Whitewash and Disinfectants

Carbola comes in powder form. Put some in a pail, stir in water and at once you have a smooth-flowing paint and a strong disinfectant ready to apply in one operation—no waiting, straining or bother. It does not spoil if left standing—once mixed always ready for use. Apply it with either a brush or spray-pump to wood, brick, stone, cement, or over whitewash. It will not clog the sprayer, nor blister, flake or peel off. Gives the surface a smooth, white finish, and goes into every crack and crevice, destroying disease germs, mites, etc.—and stays there to prevent the growth of others. One gallon (1 lb. of the powder) covers 200 square feet. It is neither poisonous nor caustic—harmless to the smallest chick or stock that licks a painted surface.

As a Louse Powder

for use on poultry, cattle, horses, hogs, etc., the dry powder is most effective. It costs less than half the price charged for other brands, so you can use it liberally and make sure of satisfactory results. Separate the hair or feathers and apply the powder directly on the flesh. Sprinkle it on the floor, in the nests and in the corners and cracks. Give Carbola a trial—you never will regret it. Order today and have it on hand when wanted.

Your hardware, seed, paint or drug dealer has Carbola or can get it. If not, order direct—prompt shipment by parcel post or express. Satisfaction or money back.



10 lbs. (10 gals.) $1.25 and postage. 20 lbs. (20 gals.) $2.50 delivered 50 lbs. (50 gals.) $5.00 delivered

Washington, D. C., Weekly News

[SPECIAL TO HOARD'S DAIRYMAN]

WASHINGTON, APRIL 18—The Farm Bureau legislative conference is still in session as this is written, having lasted into the second week. No formal announcements as to program have been made as yet but the different sub-committees which have been gathering data on the problems of finance, highways, tariff, taxation, collective bargaining, marketing, etc., are preparing their reports, and the entire list will be made up into a legislative program, behind which the full power of the federation will be mobilized.

⚜

Chairman Anderson of the Agricultural sub-committee of the House committee on appropriations has introduced a bill calling for an emergency appropriation of $400,000, available immediately upon passage for the payment of indemnities for cattle condemned and killed in the accredited herd and other anti-tuberculosis campaigns. The bill comes about as the result of the experience of the Bureau of Animal Industry in finding that it had sufficient funds on hand for the work of the tuberculosis eradication campaigns, but not enough, in the way that Congress divided the last year's appropriations, to pay for the animals condemned. Representatives of The National Grange here last week and of the National Milk Producers' Federation and of the Farm Bureau Federation expressed approval of the bill. Dr. Mohler, Chief of the Bureau of Animal Industry, also announces that funds heretofore tied up by a treasury decision have been released so as to carry on this work in a few localities.

⚜

Proposed new legislation in a few instances has some points of interest to the dairy industry. For example, there is the Aswell bill to authorize agricultural colleges and experiment stations to investigate and to teach the science and art of manufacturing and using oleomargarine, and to exempt such colleges and stations from the imposition of special taxes and the payment of taxes. This bill was introduced by Mr. Aswell, member of Congress from Louisiana, and referred, not to the Committee on Agriculture, where it belongs, but to the Ways and Means Committee, presumably because someone wanted it to go there, and some one else saw that it has to do with taxes.

The bill reads in part as follows:

Be it enacted by the Senate and House of Representatives, of the United States of America in Congress assembled, that agricultural stations shall be and are hereby authorized and permitted (a) to investigate and to teach the science and art of producing, refining and combining vegetable oils and fats including butter into palatable and wholesome food forms; and (b) to investigate and teach the uses to which such food forms are advantageously adapted; and (c) to use in the respective dining halls and boarding houses maintained by such colleges and stations, for their own faculties, student bodies, or employees, such foods so produced by them, free from any tax. In event any such institutions shall in the course of such investigations and teachings produce quantities of such food in excess of its own requirements, such excess may be placed on the markets, subject to all the laws, rules, and regulations which are now or may hereafter be provided for the production, sale, and distribution of such food."

The bill further provides for a special license to such colleges and stations to manufacture oleomargarine without payment of the tax provided by the revenue laws. Thus far this is the only oleo propaganda started, and this does not seem to emanate from the usual propaganda source, although the fact that it has gone to the Ways and Means Committee illustrates how well the real situation is understood by the enemies of the dairy industry.

Two butter bills have also been introduced. One is by Representative King of Illinois and provides that butter must be made from pasteurized cream only, and is so worded as to authorize the use of lime or other neutralizers to correct acidity. This and other butter bills have gone to the Committee on Agriculture. So far as learned no action is contemplated by the committee, at least until packer control and grain marketing legislation is disposed of.

⚜

Internal Revenue Commissioner Williams has finally declined to await the appointment of a successor, and, in a news release issued from his office this week, announces his retirement and that the office has been turned over to the Assistant Commissioner. Newspaper reports say this is the last important place not yet filled by a new presidential appointment, and that the announcement of his successor may be expected any day. In the meantime it is expected that the neutralizer ruling will be again postponed.

⚜

Acting Deputy Commissioner A. C. Holden has given out the figures on the export of colored and uncolored oleomargarine for the last calendar years as follows:—Colored oleo, 5,609,467 pounds; uncolored, 4,725,978 pounds. The Internal Revenue Commissioner has these figures because of the fact that the tax is remitted on all oleomargarine made in America and exported. The figures are interesting as showing the fact that the foreign demand, where there is no price difference due to taxation, calls for more colored goods than white, although there is no difference in either food value or flavor due to color.

DAIRY MARKET NEWS

New York Butter Market

New York City, April 19:—The peculiarly sensitive condition of the market, which is responsible for the desire on part of butter receivers to keep their stocks cleared up each day, is resulting in a fluctuating market each week. An added factor, which has resulted in sharp price declines during the past week, is a bearish sentiment that has developed during the past few days. On one or two occasions when supplies of butter were very moderate two of the largest butter receivers in the market have deliberately forced prices down by offering butter of high quality at prices considerably below prevailing quotations. With conditions as sensitive as they are at present, one dealer can do much to change the complexion of the market.

There is no excess supply of butter in the market. While reports state that there is a healthy increase in production at the present time, receipts in this market show practically no increase. In addition, no foreign butter is being received at present, and there is little likelihood that any will be forthcoming for several months. Receipts of boxed California butter are decreasing as only four cars are known to be in transist whereas eight cars have been received during the past week.

One encouraging feature which has developed during the past week is the revival of export interest in our domestic butter. England has purchased several comparatively small lots of low grade butter and is making inquiry for other lots. It is not known why there should be that demand for poor butter, unless it is to supply the bakers' demands, as England is well supplied with a sufficient supply of table grades of butter.

One disquieting feature which has become apparent of late is the prevalence of mold on considerable of the butter. While there is always more or less trouble with mold during the warm summer months, it is during the month of May that it usually puts in an appearance. The early spring, the scarcity of ice throughout the country, and the almost universal use of inferior parchment liners in butter tubs are undoubtedly responsible for the moldy condition this early in the season.

The market was weak and inactive on Saturday but on Monday there was a revival of interest and values increased 1c. Today, another receiver did force the price down 1c. The market seems to be gaining some strength and as the present decline seems to be the result of individual manipulation rather than normal functioning of the law of supply and demand, quotations will probably advance soon. Quotations at the close today were: Extras (92 score), 45½c; higher scoring than extras

W. B. LIVERANCE.

Cheese Markets Weak and Lower

(Report by U. S. Bureau of Markets)

Despite the fact that prices reached the lowest point of the year during the week ending April 16 trading was not up to expectations, and the market was slow and draggy. Heretofore markets have been somewhat irregular with regard to the relation between local conditions and the general situation, but now reports from all centers are alike in indicating that business is being done on an unsettled basis

In the distributing markets the weakness was also evident. At Chicago distributors reduced their prices in line with the decline in Wisconsin, but did not let established prices stand in the way of a sale. At New York dealers bought more heavily after country markets reached their lower level and receipts were a little more liberal. Some receivers were willing to shade asking prices in view of the fact that they expected selling prices to be generally lowered when the lower cost Wisconsin cheese reached the market, and that they desired to keep their floors as clear as possible at this time. Jobbers continue to buy for current requirements only.

The average wholesale prices on American cheese (style twins) for the week ending April 16, 1921, and for the corresponding week a year ago were as follows:

	Week ending April 16 1921	1920
	cents	cents
New York	28.0	29.5
Chicago	18.8	28.9
Boston	22.5	30.5
San Francisco	19.1	25.0
Wisconsin	18.2	29.2

The total receipts of American cheese at these markets were 3,077,403 lbs. as compared with 1,043,057 lbs. a year ago and 2,896,563 lbs. a week ago

Storage Holdings

The cold storage holdings of butter on April 1 showed an increase of over three million pounds over that of a year ago, despite a decrease of nearly 13 million pounds during March. The holdings of American cheese, on the other hand, decreased nine million pounds from that of a year ago, the decrease during March amounting to over three million pounds.

The following table gives the holdings on April 1 1920 and 1921, as reported by the U S Bureau of Markets:

Commodity	April 1, 1921	April 1, 1920
Creamery butter	14,737,000	12,555,000
Packing stock butter	2,214,000	1,149,000
American cheese	14,295,000	23,431,000
Swiss cheese	2,206,000	2,261,000
Brick & Munster	902,000	560,000
Limburger	495,000	546,000
Cottage, pot, & bakers'	2,842,000	1,954,000
Cream & Neufchatel	52,000	180,000
All other cheese	4,112,000	3,212,000
Case eggs	1,884,000	122,000
Frozen eggs	20,865,000	11,039,000

Butter Markets Display Nervous Tone

(Report by U. S. Bureau of Markets)

The governing factor in butter trading during the week ending April 16 was a desire on the part of both receivers and buyers to keep stocks cleaned up. In other words, no one appeared to have much confidence in the market and no one wanted to have any more butter on hand than was necessary for immediate needs. When receipts were short the market ruled firm, and vice versa. It so happened that the actual arrivals were only slightly in excess of those of the previous week and, with practically the entire trade on fresh butter this meant a fairly firm market.

Prices either remained unchanged or advanced fractionally throughout the week until Thursday, when New York weakened unexpectedly and declined 1c causing the other markets to follow. The decline was due partly to the fact that about 10,000 casks of Danish butter were still unsold on the New York market and partly to advices of heavier shipments rolling and rather liberal arrivals of fresh California butter. At the close of the week markets were weak and unsettled.

Danish sold this week in New York at 47—49c and California at 46½ to 48½c. California butter on the market scores anywhere from 90 to 92.

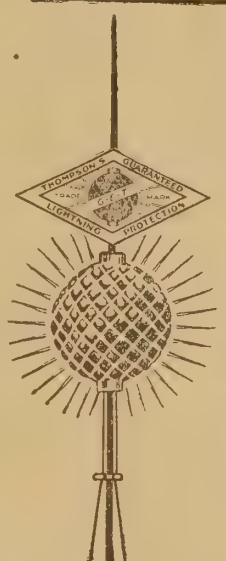
The average wholesale prices on 92-score butter at five of the principal markets for the week ending April 16, 1921, and the corresponding week a year ago were as follows:

	Week ending April 16 1921	1920
	cents	cents
New York	48.0	74.0
Chicago	46.6	62.7
Philadelphia	50.0	74.3
Boston	48.9	71.5
San Francisco	35.5	55.6

The receipts of butter at these markets were 8,730,577 lbs. as compared with 2,878,761 lbs. last year and 8,251,208 lbs. a week ago.

FIRE and DEATH Ride in the Lightning!

GEORGE E. THOMPSON
Lightning Rod Engineer and Originator of Thompson's "World's Best" System



THE FIRE DEMON rides in the terrible lightning stroke! He is plunging his torch of destruction down on barns, silos, houses,—killing, destroying, sweeping away the profits and savings of years. He kills or injures by lightning **4 people a day** in the United States. Lightning turns $22,000 of valuable property into smoldering ruins every 24 hours,—**a loss of nearly $1000 an hour.**

Lightning Waits for No Man!

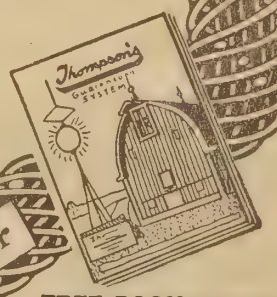
A recent investigation of 38,266 farm fires showed that 19,820 or 51% were caused by lightning,—and **every one** of these fires occurred in **unrodded** buildings.

Your barn, your house, your loved ones may be the next victims. Don't delay! This terrible destruction is going on right **now! Protection is cheaper than rebuilding.** You pay for lightning protection only once in a lifetime. Its cost is less than you would lose by fire **on an insured building.**

Enjoy Perfect Safety With

Thompson's
THE WORLD'S BEST

GUARANTEED Lightning Protection



Thompson's "World's Best" Guaranteed Lightning Protection gives the most perfect protection known to modern science. **No building equipped with the Thompson System has ever been destroyed by lightning.** It is endorsed by State Fire Marshalls, Fire Insurance Commissioners, and officials of fire insurance companies, as well as thousands of satisfied owners. It is backed by Thompson's Gold Bond Long Term Guarantee and Legal $500 Offer of Reward.

Sold at Fair Prices by Authorized Agents

The Thompson System is installed according to Thompson's Perfect Rules of Erection, only by Certified Agents who are trained as competent lightning rod engineers. You are certain of a correct installation, at standardized retail prices authorized by us.

Just out! Our new 64-page catalog, probably one of the finest books ever published on lightning protection, contains facts you need to know about safety in time of storm. It explains what causes lightning, how it strikes, how to prevent it, and tells dangerous places to avoid. It gives full details about Thompson's "World's Best" System, and shows pictures of some of the many splendid farms and pure bred livestock it protects from damage. You should read this book. Send for it today, using the coupon below.

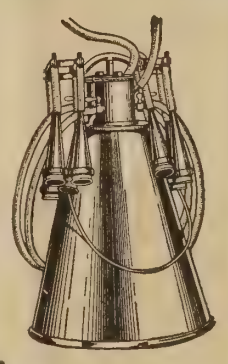
Is Your Sink 36 Inches High?

Most kitchen sinks are so *low* that they cause endless discomfort and back strain. "Standard" kitchen sinks have adjustable legs so that they can be set from 32 to 36 inches high, as desired. Measure height of sink from top of rim to floor, as shown in this picture.

Write today for copy of catalogue "Standard" Plumbing Fixtures for the Farm." It is illustrated in colors, shows many styles of sinks, complete bathrooms and fixtures, model kitchen and laundry.



Standard Sanitary Mfg. Co., Pittsburgh

Milker Book Free

What can a milking machine do for you? How can you tell what kind of machine is best? These and many other important questions are answered for you in our **free book.**

WRITE TODAY

Send only your name, address and number of cows you milk. Book and other helpful information will then be sent you promptly. No obligation.

Dried Beet Pulp

"Countess Prue"
World's Champion Guernsey

Consumed 5470 lbs. of Dried Beet Pulp in making her wonderful year's record—equally valuable in the ration of the average cow.

The LARROWE MILLING CO.
Detroit, Mich.

Possibilities of Irish Dairying

(Continued from page 623)

question it is no time to make prophesies but a few facts regarding the prospects of dairying in Ireland are fairly evident. As already mentioned the fundamental basis of the Irish question is an economic one, and it centers on the land. The farms of less than five acres in extent constitute 12 per cent of the total number of holdings, while 68 per cent of the farms or "crofts" are of less than thirty acres. The trouble in Ireland has not been in obtaining more small holdings but rather in obtaining more land for those who already have such holdings. Anyone with a knowledge of farming will concede that thirty acres of land will not support a man and his family and render them financially independent. This does not apply of course to exceptionally good pieces of land that can be used for trucking near cities.

There are 125 people directly depending for a livelihood from every 1,000 acres in Ireland, or, in other words, 8 acres must provide a living for one human being. Compare that set of conditions with those generally prevalent in the United States and the results are perfectly obvious.

There appear to be two main methods available for the development of Ireland—the introduction and promotion of industries not directly connected with agriculture, and the application of more intensive methods to farming. Irish farming could be improved but the general practices are not wasteful except of labor which is all too plentiful at times. But what can a "farmer" do who owns four acres and a plow and sometimes a donkey and a ewe? Such men are common and they are frugal and, when working for others, as they must at times do, are trustworthy and energetic. The introduction of methods which will increase the yields of agricultural products and the establishing of industries to absorb the extra labor seem to be the solution. Dairying is already quite an important industry in Ireland and its further increase will fit in well with the development of the country.

A DONEGAL HARVEST

Keep the Soils Fertile

(Continued from page 624)

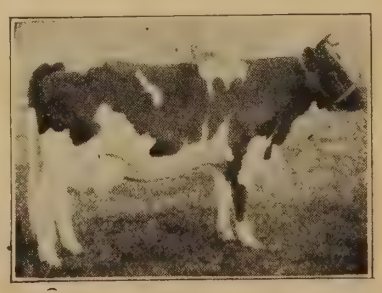
grain will not need to buy phosphate fertilizers. If you buy a half ton of bran or cottonseed meal for each cow fed, or a ton of other concentrates, you would keep up the phosphorus supply. But 200 lbs. of acid phosphate or 75 lbs. of treble superphosphate would supply an equal amount of phosphorus. Each farmer must decide which he will do.

How and When to Apply Phosphorus

Phosphorus is not lost from the soil by leaching; so it makes little difference when it is applied, or to what crop. Probably the best method is to spread it broadcast and disk it in in preparing for seeding. If a fertilizer distributer is available, that will do the best job, but it can be spread evenly over the manure in the manure spreader, and so be well mixed through the soil. Some are advocating the use of small amounts of fertilizers applied to the hill for corn. There is no objection to that method, except that no benefit is secured to the grain or clover following, while an application of phosphate, broadcast, when the ground is being prepared either for corn or small grain, will benefit all crops in the rotation, and clover or alfalfa are benefited more by phosphate even than corn and oats are.

Some Evidence That It Pays

All tests in Wisconsin with phosphate in addition to manure show an average increase of 15 per cent in yields or four times the cost.



On the Ohio Experiment Station the addition of 320 lbs. of acid phosphate to manure and lime every three years has given an average increase above that receiving manure and lime only for twenty-one years of 8⅔ bu. of corn, 5½ bu. of wheat, and 838 lbs. of clover worth at present prices over $20, while the phosphate would cost $4. The director of the Ohio Experiment Station says:

"Acid phosphate, either with or without manure, has given large profits in all cases. Per dollar invested, it has been by far the most profitable of all the fertilizer treatments, either alone, with lime, or with both lime and manure."

In Indiana the Experiment Station makes the following statement:

"As a general average of 95 crops of corn, wheat, and clover on five experiment fields during the last 12 years, acid phosphate has yielded crop increases valued at $8.46 per acre per year, at an average cost of $1.38."

Even on the rich prairie soils of Iowa an application of 200 lbs. of acid phosphate annually has increased the yield of corn 10 bushels, or oats 15 bushels, and of wheat 8.4 bushels, or more than three times the cost of the fertilizer.—Wisconsin Bulletin 42.

Witte Ina De Kol Lass, Holstein heifer owned by Aitken Bros. of Wisconsin, and which as a three-year-old has made in 7 days 716.50 lbs. milk containing 24 lbs. fat. This is the state record for milk at this age. As a junior two-year-old this heifer produced 19,466.-90 lbs. milk containing 664.7 lbs. fat.

Cow Testing Associations

(Continued from page 631)

cottonseed meal, $40; molasses, $50; alfalfa hay, $20; clover hay, $16; and silage, $6.

Tri-County, Illinois:—Better feeding has been the goal we have been striving for. By individual feeding many herds have reached greater production and in some instances at a smaller cost than when all cows received the same amount of feed. The State Hospital for Insane, the Illinois School for the Deaf, and the Lincoln State School and Colony have received some good young pure-bred bulls. In March 3% market milk sold for $2.54 per cwt. with 2c per point additional up to 3.5% and 5c per point additional for milk testing above 3.5 per cent. One dollar and forty cents per gallon was paid for 18—20 per cent cream. Feed prices are: Shorts, $1.60 per cwt; bran, $1.50, hominy chops, $1.55; oil meal, $2.60; cottonseed meal, $2.00; alfalfa, $27—$31 per ton; clover, $26; corn, 75c per bushel; oats, 60c.

Barnesville, Ohio:—During March market milk sold for $2.35—$2.85 per hundred pounds. The required test was 3.5 per cent and 5c were paid for each point above. Larro sold for $2.60 per cwt.; bran, $1.95; oil meal, $2.75; cottonseed meal, $2.75; corn, $1.50—$1.80; oats, $2; beet pulp, $2.25; gluten, $2.75; oat middlings, $2; peanut meal, $2.75; alfalfa meal, $1.75.

Riverside County Farm Bureau, California:—March 18th was live stock day in Perris Valley, over 300 persons being present. Schools and stores of Perris closed. The event was supervised by the Perris Farm Center and the Agricultural Extension Service. Some of the speakers were: N. L. Chapin, J. E. Wherrell, Bob Walker, R. E. Nebelung, F. H. Scribner, and G. E. Gordon. The demonstration was held at Sierra Vista Ranch. O. H. Cash, director of the Farm Center, was in charge of the meeting. Market milk testing 4 per cent sold for $4 per hundred pounds. Milk retailed for 16c per quart; butter for 44c per pound and cheese for 40c. Rolled barley, $32.50—$33.50; rolled oats, $41.50—$42.50; cocoanut meal, $28—$30; bran, $33—$34; No. 1 Dairy alfalfa, $24; standard alfalfa, $21; barley hay, $16—$17.

Six Years a Member

I have been a member of the New Holstein Association for the past six years and find it a benefit in many ways. It shows a complete butterfat, milk, and feed record of all cows on test, also the loss or gain over cost of feed. Through the association testing you can also find out the merits of the herd sire, thereby keeping the good sire in the community or can sell him at a much better price. I also find that the members of an association have a better and more ready market for their surplus stock. Quite often a carload of cows are taken out of our association at a very good price.—HUGO LIBKE, WIS.

Sudan Grass for Hay

Sudan grass is coming into increasing use as a hay crop, particularly where the regular seedings may fail for one reason or another. It is one of the sorghum family and makes a very excellent growth, being particularly adapted to the drier sections of the country. It responds well, however, to more moisture and has been grown successfully in the northern states, as well as in the southwest.

Sudan grass prefers a warm, sandy loam soil, but will do very well on any upland soil suitable to small grains. Soils that are worn out or very sandy are not adapted to it, nor are low, wet soils. It should not be seeded before corn planting time, and a week or two later usually gives better results, for it is a crop that flourishes in summer heat. The right time of seeding is one of the main points of success.

With seed that has been well cleaned from all chaffiness and light seeds, 25 pounds is sufficient for one acre. With seeds of poorer quality at least 30 pounds should be used. It should be sown broadcast or drilled in upon a well prepared seed bed, care being taken not to bury the seed too deep.

It should be taken for hay when in full bloom and handled the same as timothy. It yields from 2½ to 3½ tons of cured hay an acre and is very palatable, stock eating it very readily.

Build once with concrete and you've built forever. Concrete is economical, weather-proof, water-proof, rat-proof and fire-proof. Always use Lehigh—the National Cement. There's a Lehigh dealer near you; consult with him—he's a good man to know. The blue and white sign identifies him.

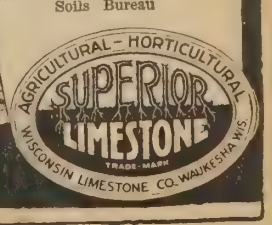
Why Land Needs Limestone



Natural lime in the soil becomes practically exhausted in 15 years. Thus, with the very foundation of plant life and soil fertility removed, land cannot produce. — Limestone must be added.

SUPERIOR LIMESTONE restores soil and increases production from 50 to 100 per cent.

Mail Soil Sample for Free Trueg Test

Co-operative Milk Company Organized in Kansas

HOARD'S DAIRYMAN: — Thirty-two leading dairy farmers supplying milk to the 80,000 people of Wichita, recently combined to form the Producers' Dairy Company with a capital stock of $20,000 and elected an experienced dairyman as foreman who with the aid of a small board of directors is sole manager. It is the outgrowth of discontent on the part of dairymen who felt the milk distributing companies were not giving them a fair deal.

The better dairymen objected to the distributors' practice of mixing their milk with that produced by the small and unscrupulous producers who maintained no recognized standards.

The scheme is not merely a co-operative one. It is a from-producer-to-consumer plan. Only producing dairymen can join it. Each member subscribed to the stock in varying amounts, agreeing at the time to sell all his milk to the company and to keep his herd under the supervision of the company's veterinarian employed to make tuberculosis tests of each of the 400 Holstein cows producing milk for the company.

The organization of the company came at a very opportune season, during the time when a local fight between the city dairy department and the milk customers demanding cleanliness was at its height. The first day the plant established by the producers opened for business, ten of the stockholders made a systematic canvass of the city, soliciting for milk customers. They succeeded in getting patrons enough to use all the milk their 400 cows can produce. It is not the desire of the dairymen to undersell any other producer in the territory. It is their aim, according to advertisements appearing in local newspapers, to furnish at competing prices a better quality of milk than has been on the local market.

The Producers' Dairy Company is prepared to supply the trade with both raw and pasteurized milk. At a total cost not to exceed $6,000 a small building was equipped with new machinery and pasteurizing equipment, all of which was new and ample enough to meet the needs. The Producers' Company of Wichita has begun business under the most promising omens. It has the support and good will of the element here that has waged war on unclean dairies throughout the vicinity and is receiving from it a large patronage.

Kansas. D. STALLARD.

Priced For Quick Sale

Two Highly Bred
Holstein Bulls
Born June 1st, 1920. Sired by Pabst Colanthus Champion. Dams by Segis Homestead. Both unusually fine animals. Write for extended pedigrees.

HOARD'S DAIRYMAN JUNIORS

A DEPARTMENT FOR THE DAIRY FARM BOY

What a Junior Corn Grower Should Know

There are several reasons why we think that this is a good subject to talk about at this time of the year. The time for planting the most wonderful of all American crops will soon be at hand. That in itself is a very good reason. And because many of the juniors will either grow a crop of corn in club contest work or will have much to do helping dad to grow his crop is another good reason. And for those who will attempt to grow the most corn that an acre of land can produce, this talk should be especially valuable.

Know About Good Varieties and Good Seed

While the kind of soil and the way we prepare it to receive the seed is an extremely important subject, it is not more so than the variety of corn we select to grow and the kind of seed we use. There was a time and not so very far back either when one might be excused for taking any variety of corn he could get to grow. That was back in the days of scrub dairy cows and scrub stock of all kinds. And it is not at all out of place to say that just as great an advance has been made in corn improvement during the past twenty years as we all know has been made in stock of all kinds. Today the good farmer knows as much about the varieties of crops that he grows as he does about the breeds of stock that he raises. If he doesn't he is not taking advantage of what has been done for him and he is certainly anything but an up to date farmer. Corn breeders have been very busy men for the past 20 years and their efforts to secure the very best varieties have been rewarded.

By all means, juniors, see to it that the variety of corn you grow this year is recognized as a standard variety for the section in which you happen to be living. If you do not know what would be best, there are several ways that we think of by which you can find out. Your county agent, if you have one, will help you and you can always find out from your agricultural experiment station by dropping a line to it. Perhaps your agricultural teacher will know about this and, best of all, perhaps dad has been growing the leading variety that there is for your section. So you see there will be little excuse for any junior corn grower using a variety that he does not know much about. There is this much that you can bank upon; your chances for winning the contest are very small if you work with any variety other than the ones which have been bred for good production.

But with the best variety that one can get, we are not assured of a big crop. The most fundamental thing about any crop is to have good seed and since it is such an easy matter to find out about the kind of seed you expect to use, we advise you to test each ear in the rag doll tester or by some other equally good way. It is not very long ago that a story appeared on the junior page in which seed corn testing was explained. Perhaps you have already tested your seed. If so, we want to congratulate you at this time. And for those of you who have not, right now is the time. Don't delay, for if you do, the seed is liable to go untested and then you will be taking too big a chance. Start right in the beginning, and then follow up with every other requirement that is necessary to grow a good crop.

IT IS FUN PLANTING CORN ON A SEED BED LIKE THIS

Know the Kind of Soil to Use and How to Prepare It

Some one has said that corn is the hog of the farm plants. I presume he meant by that statement, that corn will do very well on a great many kinds of soils but, no matter where we attempt to grow it, it is a greedy plant and that to make it grow properly there must be plenty of fertility in the soil. The best that can be expected from a poor soil is a poor crop and since we are out to win, it is of the very most importance to start with a fertile soil. One of the greatest corn crops ever raised was produced by a boy named Jerry Moore of South Carolina. He grew 228.7 bushels from one acre and you can just reckon that he could only do this on a very fertile soil. Now you might justly ask when is a soil fertile. This is an easy question to answer when we say that a fertile soil is one that will grow a maximum crop. But that hardly satisfies the question, so we will add a few things that all juniors should know about what a plant must get from the soil.

Plant chemists tell us that there are only ten things that a plant needs to make it grow well. If any one of these is missing in the soil or if any one is not present in large enough amounts the crop cannot grow in the way that it should. Of these ten things above mentioned there are seven that must come from the soil. These are phosphorus, potassium, nitrogen, sulphur, calcium, iron, and magnesium. The other three, carbon, oxygen, and hydrogen come from the air and the water and since there is usually an abundance of these three there need be little worry about them. But for a long time now most of our soils have been giving up these seven things until now in some of them there is not a sufficient amount to make crops grow well.

Acting upon this information, we should get the very best piece of soil that we can for the corn crop. It might make this point stand out better if we tell you that in order to grow a 50-bushel corn crop there must be at least about 80 lbs. of nitrogen, 15 lbs. of phosphorus, and 35 lbs. of potash ready to feed the plants. Now of course you can tell something about the soil by the crops it has been growing for the past few years. If you don't know this, we'll warrant that dad does, so it might be well to consult him on this matter. If you select a good deep sandy loam soil and work into it a good heavy application of stable manure, there will be little danger that your corn crop will starve at any time during the summer. And it will help, too, if you select a piece of land that grew a good crop of clover or alfalfa last year. Corn likes to follow a clover crop, for this crop usually leaves the soil in good mellow condition with a good supply of nitrogen. Corn is truly the hog of the farm crops, and therefore we should see to it that it is never starved at any time during the summer and the only way to attend to this is to select the right piece of ground and then manure it heavily.

Know Some Things About Corn Planting Time

Any one who has ever tried to grow corn will tell you that it is folly to plant corn before the soil is well warmed up. Corn is quite different than the grains in this respect. It is simply because it is the nature of the corn plant not to grow when the soil is cold. For this reason, corn planting always follows the plantings of the other crops. Of course it depends where one is living to quite an extent. In the corn belt and in the states further north, corn planting usually is done during the month of May and it is quite a noticeable fact that the best corn crops come from the plantings that are made in May. This is true for the central and northern parts of the country, while if we go farther south, plantings earlier than this are usually made. It is a good rule to be on the watch-out and have the seed bed all ready to plant as soon as you dare plant.

It is most important also that a good seed bed should be prepared. If the field was plowed last fall, it should be carefully worked up this spring with a harrow until it is fine and mellow. There should be no large lumps left on the surface to be in the way of the planter and the cultivator. And if the land is plowed this spring, it is very necessary to pack the loose plowing down again, either with a roller or a compactor. This is for the purpose of packing the soil next to the sub-soil so that the moisture will rise to the surface where the tiny roots will be. If you don't do this and a dry spell follows the planting it is quite possible that the seeds will not sprout well and, if they do, the little plants may suffer for lack of moisture. It is indeed quite a task to get a piece of land in good condition for planting, but no effort should be spared to make it as good as is possible.

Know Something About Methods of Planting

An examination of several corn fields will disclose the fact that there are two common ways in which corn is planted. In one case the plants are in rows, the rows being about three feet six or three feet eight inches apart and the plants stand about nine to fifteen inches apart in the rows. This is called drilling the corn in. It has its advantages and its disadvantages. Perhaps the greatest disadvantage is that it allows of cultivation only in one direction, and, if the field is weedy, it will be difficult to keep the weeds out. However, if the weather is warm and fair following the planting so that the corn

EVEN IF THE WEEDS ARE FEW, IT IS OFTEN A GOOD PLAN TO CULTIVATE THE CORN SO AS TO ALLOW THE AIR TO ENTER. MOISTURE IS ALSO CONSERVED BY BREAKING UP THE SURFACE OF THE SOIL WHEN THE CORN IS STILL SMALL

comes up quickly, the cultivator may be put to work at once and there may be little trouble in keeping the weeds out. But we never know what the weather is going to be, so there lies the danger of this method of planting.

We think the safer way to plant is in hills. This will allow cultivation in two directions and it is much easier to keep the weeds away from the plants. Some people think that more corn can be grown on an acre by drilling it in. This is only true when more seed is planted, which is very liable to be the case. Experiments carried out by those who have been interested in this prove that when the same amount of corn is planted by either method there is little difference in the yields obtained providing the weeds are kept out equally well in each case.

If corn is planted three feet—six inches apart, there will be 3,555 hills on one acre. And if there are four kernels dropped in each hill, there would be 14,220 plants if every seed grew. And since we can figure from actual count that there are from 700 to 900 kernels on each ear, it is readily seen that it takes about 15 to 20 ears to plant one acre of corn. On a good fertile soil, this should be the average rate of planting. Four and five kernels per hill is plenty if you want the plants to ear well. Five kernels is a maximum number and in most cases, four will give better results. And this is the rule in the corn growing sections of the country.

The sooner corn gets out to the sunlight after it is planted, the better. Corn is a sunshine loving plant and for that reason it should not be held back by too deep a planting. Deep plantings never gain anything. Plantings made at various depths prove that those made at about one to two inches deep give the best yields. It would be very difficult to state any exact rule about the depth of planting, but it is safe to say that we should plant just deep enough to cover the seeds well with fine, moist soil. Deep plantings do not make the plants root deeper as some seem to think, for the roots always come out on the stalk just underneath the surface of the soil.

Understand the Truth About the Values of Cultivation

Every one knows that no matter how well all the details have been looked after about planting corn, a crop cannot be had unless the weeds are kept out. As important as this is and as well as it is known, there are those who attempt to grow a crop of corn with a crop of weeds. It never has been done and it never can be done. A corn grower must understand the principles of cultivation and then apply them. To keep the weeds out after the corn has been planted is the one thing that will make a good yield of corn.

The Illinois Experiment Station did a most excellent piece of work in establishing the principles of corn cultivation. An explanation of these will clearly satisfy our understanding on this point. They represented the yield of corn obtained by growing the crop in the usual way by 100%. All other yields were then figured on this as a basis. In one series of plots, the land was not even plowed before planting. The corn was planted with a hoe and the weeds were kept out by scraping them off at the surface with a sharp hoe. The soil was not disturbed at all. The results were remarkable, I am sure that you will agree when we tell you that the yield obtained under these conditions was 80% of a normal yield. In another series of plots, the soil was plowed and a seed bed prepared in the usual way but the weeds were allowed to grow. The yield of corn from these plots was very small, about 6% to 11% of a normal yield. A comparison of these results proves beyond a doubt the importance of keeping the weeds out. In another series of plots, the soil was prepared in the usual way and the weeds were kept out by scraping off at the surface as they were in the first series. A yield of 114% was obtained. By comparing this with the first results, it is seen that at least 20% must be credited to the preparation of the seed bed. The extra 14% was due to the fact the roots of the corn plants were not disturbed, thereby allowing the plants to feed as close to the surface as was possible. This establishes the very fundamental principle that it is not wise to cultivate very deep so that the roots will be cut off.

Then to explain whether the weeds do their damage by taking the moisture that the corn plants should have, they did the following: In a series of plots the soil was prepared in the usual way, the corn was planted, and the weeds were allowed to grow. The plots were kept watered so that the plants never suffered for lack of water during the entire summer. It was found that this did not increase the yield of corn much beyond that obtained from the plots in which the weeds were allowed to grow, but which were not watered. This brought to light the fact that the weeds do not do their damage by taking the moisture that the corn plants should have but rather that they crowd the young corn plants, shutting out the air and sunlight when the plants are still small. These results apply particularly to those corn growing sections that have plenty of rainfall and not to the drier regions like Kansas and Oklahoma. In regions then that have plenty of rainfall, the prime object of cultivation is to keep out the weeds, and there is little to be gained through cultivating a corn field that is free from weeds. If the soil is heavy and tends to form a crust, it might be necessary to cultivate in order to open the soil to allow the air to enter. When corn has reached the height of two or more feet, there is such a mass of roots in the soil that little moisture can escape at the surface through evaporation. It is absorbed by the roots and thus escapes from the plants by way of the leaves. It is therefore doubtful if very much moisture is preserved in humid regions through cultivation.

Then if we apply the teachings of this valuable piece of work, we will cultivate a sufficient number of times to keep out all weeds and at all times we will cultivate shallow (not more than three inches) in order not to cut off the roots with the shovels of the cultivator.

Junior Letters

Hoard's Dairyman Juniors:—I am eleven years old and in the 4th grade. We live 2 miles from the school; it is a rather long walk. The name of our school is Bee Hive. Our teacher's name is Miss Anne Martin and she is a good teacher. I have one sister and two brothers. I got a calf from my papa and she is fine. Her name is Lily. I feed her and play with her. I have trapped a little bit with my brother. We got 32 rabbits. I like to read the junior page the best of all.

Wishing all the juniors good luck.

Minnesota. Leo Juntilainen.

Hoard's Dairyman Juniors:—This is my first letter to the juniors. I am 11 years old and in the sixth grade. I have three brothers; two of them belong to the junior club. One of my brothers earned an air rifle, a knife, and a compass getting subscriptions for the Hoard's Dairyman. My brother and I have five rabbits. We have 125 hens. My oldest brother and I have a tenth of the eggs for tending them. I have a calf of my own. We have three geese and 25 sheep. This morning some dogs got after them but did not hurt any. We have only one lamb now. We have twelve little pigs. We have 57 head of pure-bred Ayrshire cows. We are milking 32 of them. We have 9 horses. I am going to close, and if any of the juniors want to write me my address is R. 1, Swanton, Vt.

Frederick Collins.

Hoard's Dairyman Juniors:—As I had nothing else to do I thought I would sit down and write to you.

I said before that I was going to get a pig, but I got a calf instead. My father said he would rather let me have a calf. My calf's name is Bessie Prilly Fobes. She is six months old. I feed her silage with ground feed and oil meal twice a day, and also hay twice a day. She was born in September and is just as big as one of my father's that was born in the spring. I am going to join a calf club this year and take her to the fair.

I bought two rabbits this winter.

Wisconsin. Leslie Gilbert.

Hoard's Dairyman Juniors:—I received your very welcome letter and I read it two times. I was glad to hear from you.

Papa is milking two cows and expects another to calve. I am going to have it. I hope it is a heifer. I like to milk.

I sold my goat about a month ago. I bought the goat for three dollars and sold it for five dollars. I made two dollars on the goat. I expect to buy a young lamb this spring.

We are having a week off, so I am fixing my rabbit coops. I expect some bunnies in a little while. I like to take care of animals.

Wishing all the juniors good luck.

Massachusetts. Elwood N. Robert.

Hoard's Dairyman Juniors:—I am twelve years old and in the sixth grade in town school. I live on a farm of 120 acres. We have twenty-four head of Holstein cattle, fourteen of them are milking, five are yearlings, and the remainder are calves. We also have one registered bull. We have six horses and one of them is mine. We have eight pigs and about 120 chickens. I also have four ducks. My father has four calves. I am going to buy one when school is out.

We are going to have our house fixed over and get a furnace and electric lights.

I am going to raise strawberries this year as I think they are a profitable crop.

My father has been taking Hoard's Dairyman for a long time and I enjoy reading the junior letters.

I wish some of the juniors would write to me and tell me what they raise and how they take care of their calves. My address is Blooming Prairie, Minn. Donald McVerey.

Hoard's Dairyman Juniors:—It is a long time since I joined the juniors' club so I thought I would write. We have 160 acres of land, two cows, one of which is just fresh, four calves of which one is mine, two mules which papa is trying to break, and three horses, one of which is a pretty good rider.

I am in the fifth grade at school. We will have to go to school 19 more weeks before school is out. I will have to close because it is near bed time, so good-bye. If any of the juniors want to write to me my address is Route 3, Columbia, Mo. James Bewick.

Hoard's Dairyman Juniors:—I am twelve years old and this is my second letter.

I have one heifer and she is a Jersey. I am milking one cow now, but will soon milk two as we are going to bring another from the farm (I live in a village) and also her calf which is a Jersey. Her mother is a pure-bred and so is the bull.

We have two horses and their names are Sam and Kit and we also have two mules named Kate and Maud.

I have a Collie dog named Ring.

Well, I will close wishing some juniors would write. My address is Box No. 4, Millfield, O.

Stanley Howard.

Minnesota Dairy Courses

Seven different dairy short courses have been offered in the University of Minnesota this season. The total enrollment was more than 700. Two new courses which warrant special notice were those for milk dealers of the Twin Cities and for milk wagon drivers and milk plant employees. Approximately 100 men attended the course for dealers and about 500 the course for milk wagon drivers. It was estimated that those present handle about 80% of the milk distributed in the Twin Cities.

Information was given concerning the relation of milk to the health and welfare of the community; the importance of milk in the diet and of the necessity for extreme care in handling this important food product were emphasized.

E. B. Reid With Farm Bureau

E. B. Reid formerly with the Department of Agriculture has been appointed to the staff of the Washington office of the American Farm Bureau Federation. He will assist in the departments of legislation, education, and publicity. His training fits him admirably for this work.

Marathon County Guernseys

52 Registered Males and Females

Offered in Their

2nd Annual Consignment Sale

Wausau, Wisconsin, Tuesday, May 24, 1921

MARATHON COUNTY, the home of the first 1,000-pound cow, Yeksa Sunbeam, is a great Guernsey center, and the offerings in their Second Annual Sale are very high class as to type and breeding.

All consignments were carefully inspected before acceptance and will be sold subject to the sixty-day retest. The Marathon County breeders are anxious to spread the influence of good Guernseys, therefore have made offerings accordingly.

Just a few of the best that are offered:

TWO DAUGHTERS of Ona's May King of West Salem No. 27874, a son of Itchen Daisy's May King of Langwater (A. R.) and out of Ona of the Glen A. R. 415.48 lbs. butterfat at 2 years.

FOUR DAUGHTERS of Skeezicks' Princess No. 40773, who is by Skeezicks A. R. sire of 13 A. R. daughters and out of a daughter of Imp. Financier A. R.

SIX DAUGHTERS of Lone Pine's Star No. 50935, who is a grandson of Imp. Governor's Whimsome (A. R.) and Skeezicks (A. R.).

Waupaca County Guernsey Breeders' Ass'n

100 Registered Guernseys 100

Comprising the Choicest Stock From the Best Herds in

Waupaca and Fox River Valley Guernsey Breeders' Associations

will be sold at

Waupaca & Appleton, May 5-6, Respectively

These two Guernsey Communities have been breeding Guernseys for many years and it is their ambition to present such an array of Guernseys at these two sales as will reflect credit upon their breeding operations.

Every animal consigned to these sales has been carefully selected by a competent sale committee. 65% of the total number consigned are from accredited herds or herds under Federal Supervision. It is worth while to know the cattle you buy are clean.

Prize winning and high producing blood is in much evidence throughout the herds represented in these sales. There are consigned, 400-lb. 2-year-olds, young bulls with 500-lb. dams, A. R. cows, and an exceptional fine lot of yearling heifers from A. R. dams.

Free transportation, by auto, will be furnished from the Waupaca sale to the Appleton sale. Send to the sale managers for catalogs and illustrated circulars giving complete information concerning the consignments to these two great sales.

MIDDLESEX MEADOWS FARM

OFFERS

Two outstanding AYRSHIRE BULL CALVES for sale for immediate shipment

No. 1—MIDDLESEX WHITE CHANCELLOR 25273, born September 17th, 1920.
Sire—Cavalier's Netherall Chancellor 21216, who sired the winning bull calf at this year's National Dairy Show.
Dam—White Heather of Highland 42752, who stood 2nd in the aged cow class at the same show (this year's National) and who has two good Roll of Honor records.

No. 2—MIDDLESEX MANCHESTER, born March 10th, 1921.
Sire—Auchenbrain Torcador (Imp.) 24761, record priced bull of the breed and Grand Champion at Maryland, New York, Connecticut, and New Jersey State Fairs this year.
Dam—Bida Clinton 31489, who has three A. R. records that average 11,000 lbs. of milk, 453 lbs. of fat, 4.17%; and whose two-year-old daughters will have records of over 10,000 lbs. of better than 4.00%.

Both bulls have excellent individuality, and are fit to go into any show ring and hold their own. They should develop into extra good herd sires. Prices reasonable—we KNOW you can't get as good as these two for any less money elsewhere.

Marathon County Holstein Breeders'

Will Hold Their Second Annual

Consignment Sale

Wausau, Wisconsin

Thursday, May 12, 1921

60 Head of Selected Black and Whites — All Registered

Marathon County plans a real treat for you on the above named date. The promoters predict one of the liveliest and most interesting sales of the season. They have spared no effort, time or expense to realize the fulfillment of their prophecy. Every animal in the sale has been inspected by a committee of competent men who have the future welfare of Marathon County's Holstein industry at heart. They invite you to be with them on May 12th and convince yourself that the foregoing is not the product of an imaginative mind.

You'll find in the sale daughters of DUTCHLAND CREAMELLE SCHULLING BOY —a son of DUTCHLAND CREAMELLE KORNDYKE LAD showing an average yearly production of 27,800 lbs. milk and nearly 1100 lbs. butter. His dam is a 30-lb. daughter of JOHANNA COLANTHA LAD; daughters of KING LONGFIELD PONTIAC DE KOL—1215-lb. bull. This bull will be offered for sale; choice females bred to KING LYONS JOHANNA BURKE DE KOL, 28 lbs.; two daughters of a 34-lb. bull who has a 34-lb. daughter; yearling granddaughters of WINDSOR SWEET BUTTER MAID, 35 lbs., former state champion; cows bred to KING MARVEL, 33 lbs.; daughters of a 27-lb. grandson of KING OF THE PONTIACS; daughters of PIEBE JOE OAK DE KOL FOBES who is from a 27-lb. sister to OLLIE WATSON PRIME MADONNA, 30 lbs., the only cow that has given two National Champion Sires to the black and white breed.

Some of the choice bull offerings will interest you; a 31-lb. yearling whose dam is by a full brother to PIETERTJE MAID ORMSBY—a yearling son of 1112-lb. bull who is a grandson of the famous "COUNT"; a son of a 36-lb. bull and from a 24-lb. cow; a good son of a 31-lb. bull; a 28-lb. bull.

The sale will include the 60-day retest. All papers and transfers in blank will be in the hands of the Sale Co. prior to sale.

In a word Marathon County is offering you everything that it can possibly give you in order to persuade you that they want to satisfy you and make you feel perfectly at ease in patronizing their sale.

Auctioneers—Cook and Krause. Francis Darcey—Pedigrees.

Write Francis Darcey for Catalogs, Watertown, Wis.

Lake Mills Holstein Breeders'

23rd Semi-Annual

Consignment Sale

Lake Mills, Wisconsin

Thursday, May 5, 1921

Ohio Holstein Breeders'
State Guaranty Sale
May 4-5, Columbus, Ohio
120 of Ohio's Best Holsteins From 75 Herds

Bear in Mind That:

Ohio has more than 200 fully accredited herds and that over 1000 have successfully passed one test.

Nearly every animal in the sale is from a herd under state and federal supervision and all are sold subject to a 60- to 90-day retest.

Every animal is guaranteed a breeder.

You get your papers when you settle for your purchases.

Ohio has more 1000-lb. cows, more 1100-lb. cows and more 1200-lb. cows than any other state as well as more over 25,000 lbs. milk.

The 120 in this sale are fit representatives of Ohio's best. Most of them were not for sale at any price at private treaty.

You buy at your own price. Every animal up is there to be sold with absolutely no by-bidding.

If You Want Foundation Holsteins that Are Healthy
Be at the State Fair Grounds, May 4-5

GEO. E. STEVENSON, Scranton, Penna.

County Farm Bureau Employs Field Man

Directors of the Jefferson County, Wisconsin, Farm Bureau have decided to employ a county dairy field man. The object of this action is to promote a better understanding of each others' problems between the patrons and the operators of milk factories in and tributary to Jefferson County. The field man will make a special point in investigating the weights and tests of milk at factories in order that patrons may know that they are getting correct weights and tests. It is hoped that this will be the means, eventually, of patrons of each factory hiring their own man to take samples at the factory intake, test the milk, and act as their agent in this and other work. By this means confidence and good will should obtain between buyer and seller, and finally a better raw product delivered to the factory and a better finished product sold to consumers.

A committee has been appointed to employ and direct the work of this field man. They extended an invitation to the operators of all the milk plants in the county to send representatives to meet with them to discuss matters of mutual interest to both the operators and the patrons. Practically every factory in the county was represented at this conference. A spirit of hearty co-operation was manifested, which indicates a good future for dairy industry in Jefferson County.—J. M. COYNER, County Agent.

Have you talked with your neighbors about subscribing for Hoard's Dairyman? Why not do it now? Make up as large a club of subscribers as you can and send them in.

M. & P.
Healthy Holsteins

A year ago we sold a bull calf to a Virginia breeder. The dam of that calf has just finished a year's record of 17,600 lbs. of milk, 800 lbs. of butter. Was he pleased? His letter states "The bull is growing nicely, and I am glad his dam made so good a year's record."

We supply this kind at moderate prices. Write

From World Record Breeding Stock

This is the chance of your lifetime to buy the best of foundation Holsteins from a reliable breeder who guarantees every animal, the only opportunity you will have this year to purchase Pickering Holsteins at public auction.

Missouri State Holstein Show and Sale, May 23-24

Missouri State Fair Grounds, Sedalia, Missouri

The bulls are all sired by **Finderne Pride Johanna Korndyke** and out of tested dams. Part of the females consigned to this sale are sired by **Finderne Pride Johanna Korndyke,** while others are in calf to this great bull, some will be fresh at the time of sale. As you will remember, **Finderne Pride Johanna Korndyke** is a son of the highest yearly record cow living and he already has 18 ARO daughters, while others are now on test and still others due to be tested as soon as they freshen. All of these offerings can be seen at farm, before sale date. We also have a few young bulls out of high testing dams sired by our great herd bull, for private sale at the farm. Nearly 100 of this famous bulls' cows in our herd.

Special Announcement--Purchase of **King Echo Posch Lyons, Junior,** herd sire--the richest bred May Echo bull.

Write for sale catalog to **Maj. Harlo L. Fiske, Mgr.**

Purely a Breeding Establishment

Send Me Your Note

For a 32-lb. bull. I will take your note for either of these high class bulls. We will give you your choice of the following bulls ready for service under our regular gilt edged guarantee. These bulls have a straight top line and possess every feature of show ring quality. They are from the most popular breeding strains and our prices are lower than ever. Study the breeding carefully and see what you are getting in these bulls. Send us a check today for $100 and we will carry the balance any reasonable length of time.

KING LYONS BOON GERBEN is the sire of the bulls offered. He is a grand individual and promises to make a great bull. He is by a 35-lb. bull. RAG APPLE KORNDYKE BOON who is now recognized as one of the greatest bulls of the Middle West; he is from a 33-lb. dam, 29-lb. grandam who is followed by a 900-lb. cow. Consider what you are getting in this bull. The grandam on the sire's side is a 38-lb. cow.

Dam, JESSIE FOBES MAUD BURKE CANARY 2ND, 4½-year record (28.86). She is daughter of HAMILTON COLANTHA LAD who is a son of COLANTHA JOHANNA LAD, that great bull that has more high records in milk production than any other bull. The dam is from a 27-lb. daughter of HOMESTEAD JR. DE KOL. The price for this bull is $500.00.

OMAHA SEGIS LYONS, 4-year-old record (31.56). She weighs 1,850 lbs. One of her sisters has a 39-lb. record. Her sire is KING SEGIS LYONS who has nine 30-lb. daughters. He is a son of KING HENGERVELD. His sire's dam, CATRINA SEGIS (23.12). Her dam is a sister to NIVA KALMUCK, Nebraska State Champion (45.18), KING SEGIS breeding.

The Price of This Bull is $650.00

Brown County Holstein Ass'n On Parade

Monday, May 9, 1921

De Pere, Wisconsin

84 Head

A Sale That Will be Eclipsed by None —

In point of merit of the offerings—in point of the guarantees accompanying the cattle. and in point of the calibre of the men promoting the sale. In a word you have as safe and attractive a proposition at De Pere on May 9th as you may hope to have presented to you this season. To convince you that the foregoing is based on fact allow us to call your attention to a few outstanding features. There are 20 A. R. O. cows catalogued with records up to 28 lbs.—a 28-lb. 4-year-old record at that—second dam 29 lbs. and bred to a 37-lb. bull. There will be 35 daughters of A. R. O. cows lead onto the shavings on the above named date at De Pere. There will be 45 cows sold that are bred to 30-lb. bulls—one of them in calf to a sire whose dam and sire's dam average for yearly butter production 1329 lbs. The bull offerings are splendid; a son of a good 37-lb. cow; a son of King Segis Pontiac Superior from a granddaughter of "Count." Five other good bulls will be disposed of whose dams have records above 24 lbs. Remember that Brown County is noted for its clean cattle; that Brown County conducted one of the most brilliant and successful sales both from a buyer's and seller's standpoint, held last year; that she has spared no effort to make this sale surpass last year's event.

BUY DIRECT

Reasons for Buying Holstein Cattle in Waukesha County:

1. You can buy direct from the breeder through the breeders' association, organized by the breeders to promote the breeding of more and better Holstein cattle and to assist in a fair marketing of the same.
2. There are over 50 pure-bred Holstein sires in service in Waukesha County whose dams have records of over 30 lbs. butter in 7 days or 1,000 lbs. butter in a year.
3. There were 1,307 long-distance tests made on Holsteins in Waukesha County during the past year, which is more than the total in the next four leading counties in the state.
4. There are more tuberculin tested cattle in Waukesha than in any other county in the world.
5. The breeders' organization is in a position to put you in touch with "bred-for-production-stock" at reasonable prices.
6. When buying through the Association, you obtain the services of men who devote their entire time to the Holstein industry. It saves you time. You get more for your money.

150 Head
Pure-bred
Holstein Cattle
will be Sold

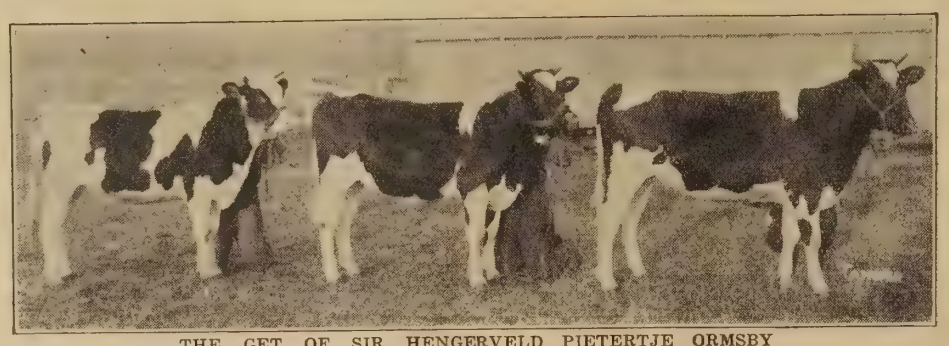
This Includes the Dispersal of the H. L. Pieper Herd

This herd has type as well as A. R. O. work back of it. The cows have records up to 24 lbs. and are bred to a 27-lb. son of Joe Oak De Kol Fobes. Two daughters of 24-lb. cows and 4 granddaughters of Joe Oak De Kol Fobes. One son of a 24-lb. cow. She milked up to 102 lbs. in a day.

All animals in the sale Tuberculin tested and a 60-day guarantee given. Our offering consists of 50 cows, many of them close springers; 25 bred yearlings, out of dams with records up to 27 lbs.; 50 yearling and heifer calves. Here is a great opportunity for parties looking for calf club calves. They are a fine lot of calves with type and breeding, many of them with tested dams with records up to 25 lbs.

We will sell 25 bulls, most of them ready for service and out of dams with records up to 26 lbs. and with sires up to 37 lbs.

We will sell 6 daughters of King Netherland Korndyke Segis, a 32-lb. sire, and 2 cows bred to him, due sale time. A daughter of Joe Oak De Kol Fobes, the bull John Bell, Jr., bought at our March sale. 4 granddaughters of Joe. 3 daughters of King Korndyke Veeman from dams up to 27 lbs. bred to King Sadie Vale Walker, a son of the youngest 29-lb. cow in the world. 5 cows with records up to 21 lbs. due right after the sale to a 28-lb. bull whose sire's dam is a 37-lb. cow. 1 granddaughter of King Segis Pontiac Polkadot, out of Johanna Bonheur 2nd, with 20 lbs. butter in 7 days. 8 daughters of a 25-lb. son of Spring Farm Butter Boy, out of A. R. O. dams. Twin heifer calves out of a 32-lb. sire. 4 heifers sired by a 26-lb. Bluebird bull, and 3 Bluebird heifer calves out of 18-lb. dams and a 30-lb. sire. Also 2 heifers bred to a 29-lb. son of King Segis Pontiac Count. 3 cows bred to Meadowholm Ona Button Hartog, a 30-lb. 7-day and 1200-lb. yearly bull.



Catalogue ready May 1st.

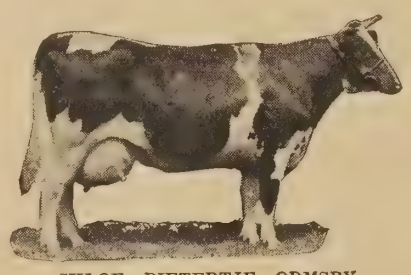
What You Can Expect to Raise From Our Consignment to the State Sale



THE GET OF SIR HENGERVELD PIETERTJE ORMSBY
From left to right they are—from a daughter of Cedar Lawn Canary Paul; a daughter of Miss Netherland Piebe; from a daughter of Cedar Lawn Champion.

SIR HENGERVELD PIETERTJE ORMSBY
First at Minnesota and Waterloo, 1920.

Miss Netherland Piebe, one of our consignment, has to her credit 652.8 lbs. milk and 31.35 lbs. butter in 7 days as a junior 4-year-old, 2746.5 lbs. milk and 131.05 lbs. butter in March, and 6.773 lbs. fat for semi in April. She will be bred to Sir Hengerveld Pietertje Ormsby.

CHLOE PIETERTJE ORMSBY
Dam of Sir Hengerveld Pietertje Ormsby. She has 3 heifer records above 1000 lbs. and is now making 1200 lbs. for the year.

Piebe Ormsby Glen Johanna, her daughter and also consigned, is sired by a full brother to Queen Ormsby Glen, a 22.37-lb. junior two-year-old daughter of Sir Korndyke Glen. She is safe in calf from a Jan. 4th, 1921, service.

Our herd is under State and Federal Supervision and has just passed the triple test.

If you are looking for Breeding, Individuality and Production combined, buy this young mother and daughter at Faribault, May 4th.

SIR PIETERTJE ORMSBY MERCEDES,
HIS DOUBLE GRANDSIRE
He has 14 1000-lb. daughters.

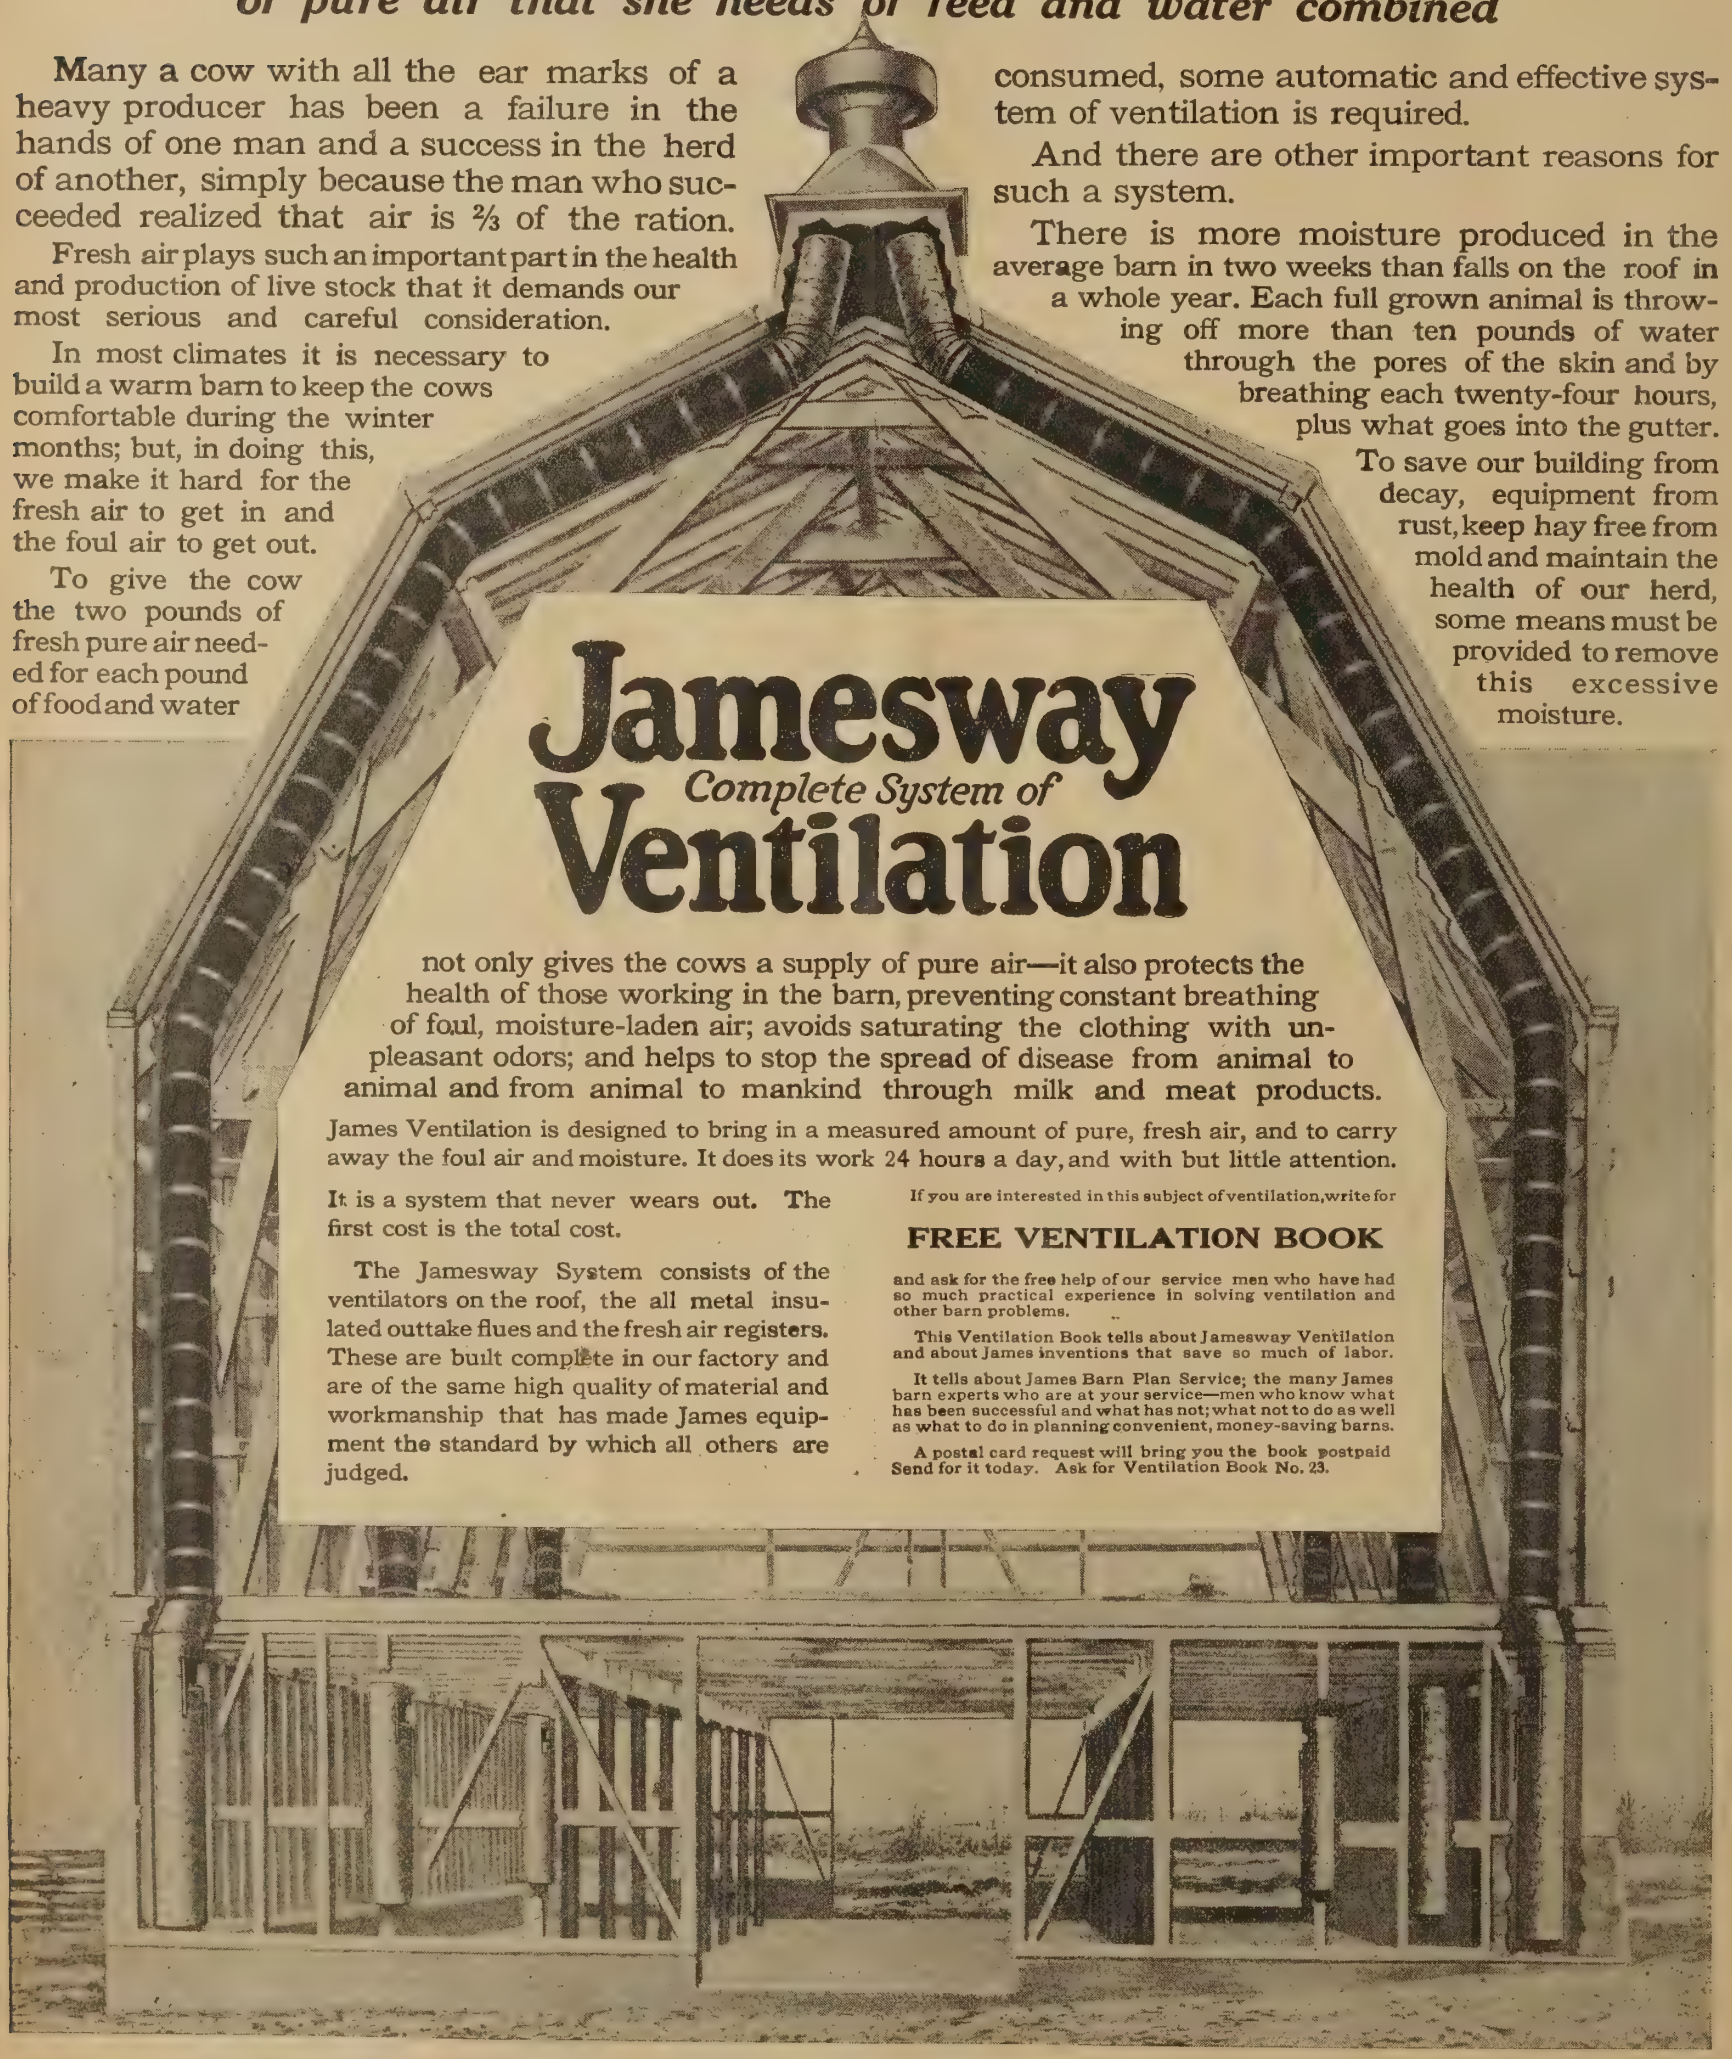
Pure Air Prevents Disease

How Much Fresh Air Does a Cow Need?

THIS IS THE ANSWER: A cow needs twice the weight of pure air that she needs of feed and water combined

Many a cow with all the ear marks of a heavy producer has been a failure in the hands of one man and a success in the herd of another, simply because the man who succeeded realized that air is ⅔ of the ration.

Fresh air plays such an important part in the health and production of live stock that it demands our most serious and careful consideration.



In most climates it is necessary to build a warm barn to keep the cows comfortable during the winter months; but, in doing this, we make it hard for the fresh air to get in and the foul air to get out.

To give the cow the two pounds of fresh pure air needed for each pound of food and water consumed, some automatic and effective system of ventilation is required.

And there are other important reasons for such a system.

There is more moisture produced in the average barn in two weeks than falls on the roof in a whole year. Each full grown animal is throwing off more than ten pounds of water through the pores of the skin and by breathing each twenty-four hours, plus what goes into the gutter.

To save our building from decay, equipment from rust, keep hay free from mold and maintain the health of our herd, some means must be provided to remove this excessive moisture.

Jamesway
Complete System of Ventilation

not only gives the cows a supply of pure air—it also protects the health of those working in the barn, preventing constant breathing of foul, moisture-laden air; avoids saturating the clothing with unpleasant odors; and helps to stop the spread of disease from animal to animal and from animal to mankind through milk and meat products.

James Ventilation is designed to bring in a measured amount of pure, fresh air, and to carry away the foul air and moisture. It does its work 24 hours a day, and with but little attention.

It is a system that never wears out. The first cost is the total cost.

The Jamesway System consists of the ventilators on the roof, the all metal insulated outtake flues and the fresh air registers. These are built complete in our factory and are of the same high quality of material and workmanship that has made James equipment the standard by which all others are judged.

If you are interested in this subject of ventilation, write for

FREE VENTILATION BOOK

and ask for the free help of our service men who have had so much practical experience in solving ventilation and other barn problems.

This Ventilation Book tells about Jamesway Ventilation and about James inventions that save so much of labor.

It tells about James Barn Plan Service; the many James barn experts who are at your service—men who know what has been successful and what has not; what not to do as well as what to do in planning convenient, money-saving barns.

A postal card request will bring you the book postpaid Send for it today. Ask for Ventilation Book No. 23.

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

Fort Atkinson, Wisconsin Volume LXI, No. 16 May 6, 1921

Contented Cows

Creonoid keeps cows contented. Spraying your cattle drives away the insect pests that hold down farm profits. Creonoid is safe, lasting, and does not gum the hair.

Increase Your Milk Profits

"I SAVE from $30 to $50 per month by the use of Creonoid," writes a farmer from Alta Loma, Texas. "By its use night and morning, my cows have practically 24 hours of peace and comfort . . . I have used Creonoid for more than a year in my dairy, and I find it so superior to all other 'fly dope' that there is no comparison."

That is but one instance among thousands, where Creonoid has increased the milk yield. Experts say that cows give 25% more milk, when freed from the fly nuisance. The lactation period is also materially increased.

CREONOID
FLY SPRAY AND LICE DESTROYER

CREONOID is a very inexpensive and wonderfully effective fly-spray for horses and all live stock. It is easy to apply. After its use cows will stand still at milking time, and should show an increase in weight and milk yield.

Creonoid will pay for itself many times over through increased farm profits. You will find what thousands of other farmers already know—that Creonoid means more milk per cow, more eggs per hen, more pounds per hog.

Creonoid comes in 1 gal. and 5 gal. cans, and in 50 gal. barrels. If your dealer doesn't carry Creonoid, write to us and we will see that you are supplied.

Illustrated booklet, describing uses and methods of application, sent to any address upon request.

The League Plant at Newark

H. H. LYON, N. Y.

NOT long since I visited the Dairymen's League plant in Newark, N. J. It is very conveniently arranged, is a particularly substantial building, and is attractive in appearance. It is three stories above the basement and a very roomy affair. At the left of the building, as seen in the accompanying illustration, there is a house and stables belonging to the League association. Something like a dozen horses were purchased with the building. These will be disposed of and motor trucks used as no house to house delivery of milk is contemplated. It will be possible, in case more room should be required some time, to remove the house and enlarge the milk plant considerably. It looks to me like a very enterprising move on the part of the League.

It is understood by many that other plants will be yet operated, perhaps mostly in New York City so far as others next to be acquired are concerned. The New York City trade can hardly be handled from Newark. Mr. C. A. Weiant is in charge of the city plants. I had heard much about Mr. Weiant and was very much in his favor before I saw him. He has had the best training that a man can have for such an important department, having been a moving force in all the recent developments of the Borden Dairy Products Company and for some time the president of the company. Mr. Weiant is a real human dynamo, a man of energy, and acquainted with every detail of the business. Not once did he hesitate for an instant in going through the plant to explain all about conditions. Most managers have occasionally to turn to subordinates for details.

Let us remember that this is now simply a beginning and that all the things desired to be done cannot be accomplished in a day. That a fine start is made in getting milk direct to where families can have it in splendid shape for use at reasonable prices is indeed worth while. Not only will milk in bottles and cans be supplied but other products, including ice cream, will be handled. Since the League has up-state plants they are in position to deliver what is wanted as fast as wanted, and no more. There are problems connected with this enterprise that will require time to solve. Conditions are favorable for solving them. It has long been held by many that there is need of milk in stores all about the cities where any person can go for the best milk whenever they want it and get it at a fair price. This need once filled makes the first step in the solution of the milk question, and it looks reasonable.

The milk stores in the large cities handle a big lot of milk at retail. Moreover, the turn is quickly made. If the station in the city can get milk to the stores at eight cents a quart and the store sells to the customer who calls at 9 cents and makes even 24 turns a month on the eight cent investment, there is three hundred per cent a month on the money invested. The man who brings it in puts it where wanted and the customer takes it away so the labor charge where several hundred dollars' worth is handled in a day is quite moderate. The retail dealer, Mr. Weiant says, hardly realizes the profit on the money invested. It is a part of his job, as he sees it, to make the retailer see the advantage to himself of increasing his business.

This step made by the League executive committee has added considerable to their prestige as to management, for farmers have long been anxious to see cheap milk in the city to the extent of economical handling. More than that the selection of Mr. Weiant to manage the business has further added to the confidence of the farming public. It has also put some stop to the small business men in towns who deride the ability of our officials to handle a business of consequence. Somehow it is almost impossible for our town folks to see that our farmers have good abilities and enterprise enough to employ experience in working out details. They have to admit it now and then and will do it faster if we as farmers stand squarely for it. We have the right to and should. Our management is honest and capable, and the special men for special duties are the best to be had or are changed. Mr. Weiant is in for building a business that shall serve that group of cities near the mouth of the Hudson, the biggest in the world, with milk at moderate prices. So will the League prosper.

THE LEAGUE PLANT AT NEWARK, N. J.

The same kind of vegetables should not be grown twice in succession in the same part of the garden, if this can be avoided. If a radically different kind is grown disease spores and insects, though present in the soil, are not so liable to attack the second crop.

Every member of the family requires nearly 1,100 meals annually. How many of these are coming from the home garden this year?

HOARD'S DAIRYMAN

A WEEKLY JOURNAL DEVOTED TO DAIRY FARMING

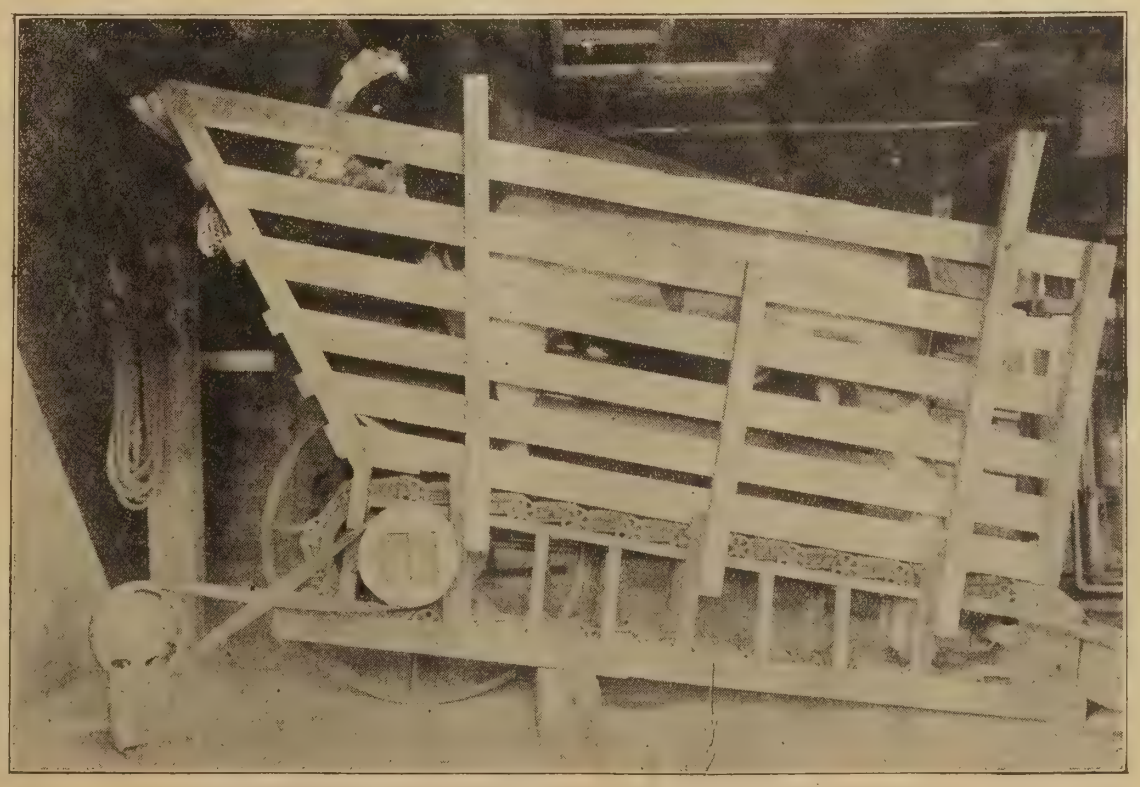
Volume LXI | FORT ATKINSON, WIS., MAY 6, 1921 | Number 16

Milking With A Bull

OSCAR TRETSVEN and H. E. MURDOCK, MONTANA

KEEPING the dairy bull tractable and in good physical condition without great expense and trouble has always been a very difficult problem. In order to control and record the time of breeding the cows and to avoid trouble with the neighbors, most dairymen keep the bull confined to a box stall or a small paddock. Under these conditions the bull takes but limited exercise and becomes restless, vicious, and frequently impotent at an early age. For these reasons many high priced bulls are sent to the butcher before their offspring have had an opportunity to prove their merit and before the real value of the bull as a breeder has been determined.

Many schemes to solve the problem of managing the bull have been devised. Exercising him by hanging a block of wood on a chain for him to bunt, picketing him on an overhead wire, or leading him out for a walk of a mile or more daily are common methods though not entirely satisfactory. Our experience at the Montana Experiment Station farm for the past three years in working a dairy bull in a treadmill and the results of recent tests to determine the mechanical horsepower thus generated have been so satisfactory that we hope the facts may be of value to dairymen in managing their bulls as well as in solving the problem of power for operating mechanical milkers and other light-running machinery on the farm.



During the summer and fall of 1917 a valuable two-year-old Holstein bull on the Station farm became quite unruly. To keep the animal tractable and in good physical condition it was decided to work him in a treadmill. A one-horse machine of the flat-treadle type was obtained on which an extra strong rack was built for holding the bull. At first he objected to entering the rack on the mill; but, learning that he could not get away, he took his place and since then has not offered any resistance. By starting the mill slowly at first he soon learned to work. As the treadmill was originally made for a horse, it was governed at a speed too fast for the bull. This necessitated making a governor effective at low speed. A governor of an old self-feed threshing machine was reconstructed and proved quite satisfactory. After the bull learned to work, the treadmill was belted to a line-shaft to which other machines were attached.

During the first fall and winter the bull was worked a few minutes almost every day at running a feed cutter and a root slicer.

In the fall of 1918 a mechanical milker was installed and the bull was given a trial at running the vacuum pump. Having been idle during the early part of the season he was not able to stand the work for the entire milking period. A gasoline engine was used to relieve him toward the end of each period until he became accustomed to the task. For a time some trouble was experienced in keeping him working while the men were operating the milkers. He found that if he placed his toes in the cracks between the boards in the rack the machine would stop. To prevent his doing this the cracks were filled, making the inside of the rack smooth. He also learned that by backing against the cross-bar which kept him in the rack he could stop the machine. For fear he would tear out his ring if his lead rope was tied fast, a light rope, snapped to his ring, was run through a pulley to a weight which rested upon the floor when he was in position, but this scheme failed to keep him from stopping. Then an automatic slapper was made. This device is set across the rack behind the bull and is so arranged that when he stops walking his thighs bring pressure upon the mechanism which recoils and releases a spring which gives him a sharp slap on the rump. As the bull hastens forward from the punishment received the slapper automatically cocks itself and is ready for the next offense. After trying to stop the machine a few times the bull learned the consequences and since then no trouble has been experienced.

For the past two years the bull has furnished the power twice each day for operating a vacuum pump for three single units. Three times during this period it was necessary to resort to a gasoline engine for power for short intervals because the bull became lame. The time required to milk the herd, which has averaged about twenty-five cows, has ranged from an hour to an hour and thirty minutes for each period. With the tread of the mill on a slope of 22.4 feet rise in 100 feet, and the bull traveling at the rate of about one mile an hour, sufficient power has been generated to maintain the required vacuum for operating the three units. At the time the bull began running the milking machines he weighed 1,835 pounds. After twenty months of service in the treadmill he weighed 2060 pounds, a gain of 225 pounds. While no experiments were conducted to determine just how much more feed was required to grow and maintain the bull while working, it would seem from our observation that the amount was very slight. The exercise and daily handling have kept the bull tractable and in the very best physical condition.

The time required to oil, start, operate, and stop the treadmill was found to be no greater than that for a gasoline engine when the time required to keep the engine in condition was considered. The treadmill is so simple in its construction and so easy to operate with a well-trained bull that the men doing the work have no desire to use the gasoline engine for power.

HOLSTEIN BULL FURNISHING POWER FOR A MECHANICAL MILKER

Experiments to Determine the Power

To determine the power developed by the bulls in a treadmill a series of experiments was conducted, using a Holstein bull weighing 2,060 pounds and a Jersey bull weighing 1,250 pounds. Experiments were made with the angle of the tread varied to cover all those most likely to be used in practice as well as with various specds of the bull.

For the equipment at hand a speed of 60 revolutions per minute, which gives the walking speed of the bull as one mile per hour, seemed to be about the best. The average horsepower developed by the 2,060-pound bull at that speed varied from 0.75 to 1.02 for the slopes varying from 20 per cent to 25.1 per cent and that developed by the 1250-pound bull varied from 0.42 to 0.62. For example, the power developed by the heavier bull on a rise of 22 feet per 100 was 0.8. The mechanical efficiency increased slightly also as the slope was increased and was a little higher for the heavier animal.

Conclusions

1. Working the herd bull in a treadmill tends to keep him tractable.
2. Daily exercise in a treadmill keeps the bull in good physical condition and consequently prolongs his usefulness.
3. The size of the bull, the rate of travel, and the slope of the tread are the factors which determine the power obtained.
4. The power is well suited for operating cream separators, water pumps, mechanical milkers of a size within the capacity of the bull, and other light-running machines.
5. A treadmill is simple in its construction and easy to operate.
6. Not much time is required to teach a bull to work.
7. An automatic slapper may be necessary to keep the bull from stopping. It can be made by a blacksmith.
8. The cost of working the bull a few hours each day is nominal.
9. Treadmills with flat treads are preferable as they prevent slipping.
10. Treadmills will give better satisfaction where the temperature does not fall much below freezing.
11. A concrete floor with a drain under the treadmill will facilitate cleaning.
12. When a bull is used in operating a mechanical milker a large horse should be trained as a substitute if no other power is available.

—From Circular 93 of the Montana Experiment Station.

NEW ENGLAND'S MILK MARKET

TWO farmers on a local train in Vermont a few weeks ago fell into an argument concerning the marketing of milk. Though their discussion, like the train on which it occurred, was anything but smooth running and was equally uncertain as to when or where it would stop, it would have gained attention among milk producers anywhere in New England. For the subject of fluid milk selling is timely, from the south coast of the Nutmeg State to the milk shipping districts of Maine.

The argument centered about the New England Milk Producers' Association and its influence on New England dairying. One farmer was a member of that organization; the other wasn't; one was whole heartedly for it, while his companion was unreservedly "agin it" and its whole system of operation. One claimed it had saved the business of the milk farmer; the other charged that it collects $100,000 annually and returns the farmer nothing. It was credited with selling milk to the distinct advantage of the farmer and, in the next instant, accused of not really selling at all but merely setting the price. The association's defender argued that it has gotten cost of production plus a profit for milk and was told that it not only does not know what the cost of production is but that it couldn't sell on that basis if it did. One of the debaters declared that "milk's milk and that's the way to sell it"; the other, "that butter and cheese are manufactured from milk and will enter its market to set the price", and "in spite of cost plus figgers", when fluid milk sells disproportionately high.

As the writer left the train the "pros" of the subject were about evenly matched with the "cons". So far as an agreement on the matter goes, the argument may still be on. It is in many sections of the Boston milk territory.

The "N. E. M. P. A."

The New England Milk Producers' Association was organized in 1916 and began business in February, 1917. It was formed when many held that it was impossible to bring the widely scattered individualistic milk producing communities of New England together under a co-operative selling plan. That the period following its beginning was distinctly favorable to its growth, detracts nothing from the strength it has attained. Its present membership exceeds 21,000 and its annual income $100,000 from the membership dues of $1 and a charge of .5 per cent of the gross receipts, collected chiefly by distributors. It is organized in 350 local associations and 50 county organizations, covering all of New England and part of New York.

Its Purposes

In the by-laws and regulations of the "N. E. M. P. A." its purposes are specified as follows: "The purpose of this association shall be to enable its members to secure the full market value of their dairy products; to improve the methods of milk production, distribution, manufacture, and use; to encourage the breeding and raising of better dairy stock; to promote the more economical feeding of dairy stock; to promote the legislative interests of the dairy industry; to foster co-operation in agriculture, and especially in dairying; and, in general, to improve agricultural conditions and bring about a better understanding between the producers of dairy products and the consumers thereof."

In the member's agreement with the association, the text of which appears on this page, the obligation of the association is stated as follows: "The association agrees to do everything in its power to procure for the member the full market value of his dairy products and to protect and promote his interests in every possible legitimate way." No mention is specifically made of improving production through association effort.

Its Service to Members

Testimony of the N. E. M. P. A.'s service to its members may be found in the fact that from its organization to the beginning of 1921 there has been but one month when the price was not higher than for the corresponding month of the previous year.

If the critics of the association choose to credit this steady increase to the general climb of prices, it will yet be found that Boston milk prices have ranged very high when compared with those in other sections. The March, 1921, schedule is an example. When New York producers sold milk for 6¾ cents, members of the N. E. M. P. A. received 8¼ cents. While market milk the country over failed in 1920 to maintain its 1919 average, the quart price paid the producer in the Boston district in 1920 averaged .719 cents above that in the previous year. This increase totaled $889,314 in the milk handled by the five largest dealers in Boston in 1920, according to the report of Richard Pattee, managing director of the association. He estimates that the gain to the farmer for the year in all the New England markets, through the increased price brought about by the N. E. M. P. A., totalled not less than $5,000,000. This being true, the farmers' $100,000 is a fair investment, however it is spent. At least there is evidence that the association has been a powerful factor in maintaining high prices on fluid milk.

The N. E. M. P. A. recognizes its first duty as service to its members. It seeks the best price for their milk. While those who desire to build the dairy industry of New England have not, as a rule, sanctioned its methods of operation, they have not doubted it has profited those of its members who ship milk. It is charged, however, that the association has organized producers patronizing co-operative buttermaking creameries in order to secure revenue—that it collects dues from members for whom it does not sell milk and "holds the milk of such members out of the market unless it is sold for N. E. M. P. A. prices, which results in such milk taking a much lower price when manufactured, especially when the present differential is maintained between manufactured milk and market milk." This charge is parried with the claim that the products of creameries sell for more because of the high price of fluid milk which therefore benefits the members who do not ship milk, that the only effect of letting extra milk on the fluid market would be to reduce the price to all, and, finally, that no compulsion is used in securing members among producers who are not milk shippers.

Cost of Production Plus

A consideration given much emphasis in establishing a price for milk is the data of the N. E. M. P. A. on the cost of production. The figures on costs are based on the quantity figures used by the Regional Milk Commission, with new costs for feed applied. The labor charges are those shown by a mail survey in October, 1920. Grain costs are based on returns from a questionnaire sent to retail feed dealers. The latest data obtained show the cost on Massachusetts farms to be $.1092 per quart, the highest of the five states; Maine and New Hampshire costs tied at $.0896 per quart; Connecticut came next with a cost of $.0867; and Vermont made the lowest figure, $.0756. The weighted average for the five is $.0832. March costs are calculated to be 106.1 per cent of the average for the year. 106.1% of $.0832 is $.0883. To this is added the station, can, and freight charge of $.0178 per quart, making the total F. O. B. Boston cost $.1061. The charges for grain are quite uniform throughout the territory, being lowest in Connecticut. After Connecticut comes Maine and New Hampshire in order of cheapness, Vermont and Massachusetts having the highest feed costs.

Vermont makes the lowest charge for labor, Maine ranking next, and the other three in this order: Connecticut, New Hampshire, and Massachusetts. Boston's milk supply comes from six states and Canada; 43.9 per cent from Vermont; 16.8 per cent from Maine; 14.7 per cent from New Hampshire; 11.6 per cent from New York; 8.77 per cent from Massachusetts; 2.7 per cent from Connecticut; and 1.6 per cent from Canada.

The Fallacy of "Cost Plus"

The N. E. M. P. A. furnishes a striking example of the fallacy of the "cost plus" theory of marketing. Its statistics indicate that the March cost of a quart of milk delivered to New England's chief milk market, Boston, was $.1061. At the same time the association boasts, as well it may, when other markets are considered, that it sold that same quart F. O. B. Boston for $.0825. Irrespective of such figures farmers have month after month steadily increased their production of milk until the surplus is the greatest in the history of New England. Apparently the loss on each quart of milk, as shown by N. E. M. P. A. statisticians, only serves to encourage the farmer's desire to suffer more of that loss.

Does the consuming public interest itself in the production cost of its milk? Do N. E. M. P. A. figures showing the farmer's loss encourage the housewife to increase the daily milk order? Data on the total of retail milk in Boston answer, "No". Clearly the consumer's appetite for milk is not whetted by cost statistics.

Leaks in the Price Dyke

For a long time the N. E. M. P. A has successfully maintained its price dykes about Boston and its other milk markets, keeping out the surplus

(Continued on page 689)

Member's Agreement With N. E. M. P. A.

The association agrees to do everything in its power to procure for the member the full market value of his dairy products and to protect and promote his interests in every possible legitimate way.

The member pays herewith one dollar membership fee and agrees to be bound by the by-laws and regulations of the association.

The member hereby subscribes for The New England Dairyman for one year, and twenty-five cents of the amount paid with this application is to be devoted to such subscription. (This paragraph is optional. Strike out of the paper is not desired and 25c will be refunded.)

The member appoints the association as his agent for the sale of all dairy products produced upon farms controlled by him, except such as are used for home or farm consumption, and his agent for the collection of the purchase money; and authorizes the association to retain therefrom one-half of one per cent, as his dues of membership in the association, remitting the balance to him.

The association may, at its option, authorize the purchaser of such products to transmit direct to the member all of the purchase money except the amount retained for membership dues.

The member agrees to deliver such dairy products pure and unadulterated, in condition suitable for sale, to such shipping station or plant as may be designated by the association.

If the association should be unable to find a market for such dairy products, or any part thereof at any time, it may notify the member, and thereupon the agency shall be suspended until the association gives notice that the agency is to be resumed.

This contract shall remain in force until terminated by the death of the member or on December 31st of any year by notice in writing by either party to the other mailed during the month of November of that year.

For breach of this contract the party in default shall pay to the other party the sum of five dollars per cow for the number of cows stated on the reverse, as liquidated damages and not as a penalty.

⚜

(Editors Note: On the reverse side of this agreement blank appears the following "order" addressed to the dealer to whom milk is shipped).

The undersigned member of the New England Milk Producers' Association hereby authorizes and directs you to deduct one-half of one per cent from the moneys due or to become due to him for all dairy products sold by him to you, and to pay over the amount so deducted by check to the said Association, at the time of each payment to him of the balance of said moneys. This order is to continue in force until revoked by him in writing.

TYPICAL FRIESIAN HOME

PLOWING IN FRIESLAND

CO-OPERATIVE CREAMERY AT MARRUM

DAIRY PROSPERITY IN FRIESLAND

E. T. LEAVITT, IOWA

A LAND flowing with milk and honey might have been written to describe the prosperity of Friesland, the province of Holland north of the Zuider Zee. It is here that dairying has been developed to the highest degree. Since the ninth century this country has been noted for its production of dairy products and for its black and white cattle. With an area a little less than that of Rhode Island, the milk from its 200,000 cows produce for export an amount equal to nearly one-third of the whole milk cheese and much more than one-third of the creamery butter made in Wisconsin.

England is on a butter ration and a traveler must learn to be content with oleo most of the time. In France butter is served but once each day in dainty little rolls; but in Friesland, not once each day, but for every meal (and in the country there are four of them) it is offered by the plateful and not in little rolls or squares. Cheese is served two or three times each day to each person and in amounts that would supply an ordinary American family for a week.

Along the fine country roads are comfortable appearing brick houses with great barns attached, every place radiating contentment and prosperity. Lively youngsters were clattering around in wooden shoes, vigorous women were to be seen with the ever present scrub brush hard at work on the brick stoop in front of the home and the men in the fields showed no lack of vitamines in their diet. These people are a different nationality than the Dutch, although a part of the Netherlands has a separate language, a cross between English and German. They have their own literature and cling to a number of their ancient customs. The ladies have kept their national headdress and their highly polished brass plates.

Clean Stables and Clean Cows

My host arose at four in the morning to milk the cows that were in the pasture about two miles away and near the North Sea, so that the milk would be ready for the driver who calls twice each day to deliver it to the co-operative creamery in the village less than a mile away. From May until November the cows are given no supplement for the pastures are luxurious. During the other six months they are quartered in the barn which adjoins the house and are fed cotton and oil cake or perhaps soybean meal with the grass hay. I had always been curious to see lace curtains in a cow barn and while they did not have them here my longing was satisfied at a number of farms. It was October then, but I could hardly believe that cows had ever been in the barn. Even the ceilings were scrubbed until they were as smooth as if they had been sand papered.

Our main meal came at 10 o'clock and while it was somewhat the same as a farmer's dinner in this country, that which seemed to be a favorite dessert was made from buttermilk and wheat cooked together at a high temperature at the creamery. This was eaten with molasses or sugar. During the evening we sipped buttermilk which was warmed up with some kind of a seed which gave it a decided flavor.

As we cycled through the country we could see the men plowing in the fields, most of them using three horses to the plow with one man guiding and the other taking care of the horses. Every few feet a special furrow is plowed to carry the surplus water to the ditches. From the ditches the windmills pump the water into the canals, which are higher than the surrounding country, and carry this surplus water to the sea. The country (two-thirds of which is in grass), the spacious barns, the windmills, and the canals, all seem to make a perfect background for the big black and white cattle we saw everywhere.

In respect to color and general appearance the Friesian cattle, like those of northern Germany and Jutland in Denmark, are the same as our Holstein-Friesians, but there are a number of red and white cattle which are very common in other parts of Holland. These are called the M. R. Y. breed after the three great rivers of Holland, the Maas, Rhine, and the Yeel, in whose valleys they are largely found. In Gronigen, a province east of Friesland, the cattle are entirely black except for their heads which are white. Besides the cattle, every farmer seemed to have a few milk sheep which are said to give from two to four pounds of milk daily from April to December. This tests from five to ten per cent fat and makes a delicious cheese. Five thousand of these were sent recently to Austria.

The First Exporter

A visit was made to Sirtema State, the home of K. N. Kuperus, and from which so many cattle were imported to this country forty to fifty years ago. It was from this herd that Mercedes came, which at Iowa City in 1883 made the breed famous with her record of nearly 100 lbs. of butter in 130 days. During the following year more than 800 head were brought over here through the medium of Mr. Kuperus. At the present time he and his sons are the foremost exporters of cattle, most of them going to South Africa, Australia, and South America. That day he had left for Amsterdam to meet his son who had just returned from Argentine where he had taken a consignment which had won prizes at the shows and was said to have been sold for a very good price. On the two farms, with a total area of 187 acres, 65 cows and about 60 sheep are kept in milk.

At Jelsum we saw some of the finest show cattle of Friesland at the three herds of the Wassenaar Bros. My respect for one cow was increased when I was told that her last three calves, all bulls, had sold as yearlings at an average of $1,500 at the present rate of exchange. From a standpoint of individuality, the Holstein-Friesian of the New World has gone a long ways from the type which her cousin of the Old exhibits. The Friesian breeder does not desire the refinement in the head or neck or throughout the body which is demanded in the show rings of this country. While the main function desired is the production of milk, the breeders still pay considerable attention to fleshing qualities. A square rump and full and extended quarters are called for in the score card. Only 20 points are given to cover the entire mammary system while eighteen points are reserved for general impressions as the animal is seen while still and at a walk.

It has been only a few years, comparatively, that attention has been paid to the improvement of conformation and records by systematic breeding. The herd book was not established until 1887, while the Holstein herd book in the United States was begun in 1872. Of the 200,000 in Friesland about 10 per cent are registered while a very few outside this province are registered. All of the herd book cows are tested each year on somewhat the same basis of our cow testing associations. In 1916 the average production of those over three years old was 10,560 lbs. of milk with 3.3 per cent butterfat or 348.48 lbs. The highest record made last year was 22,000 lbs. of milk with a 3.5 per cent test giving 770 lbs. of butterfat.

Requirements for Registration

"We believe that our cows have gone far enough in milk production and that it is our business to encourage improvement of conformation and type," declared the secretary at the Herd Book office. For this purpose the inspection feature was introduced into the society in 1901. We have a calf book where the animals are temporarily registered. The heifers are inspected when they are a year old and later when they have their first calf. If found satisfactory by a committee after the second scoring their names are placed in a permanent register with their score and yearly records. The young bulls are inspected when a year old and then at the age of 18 months before they may serve as registered sires.

"Records of the registered progeny of a sire are kept and those which have 80 or more are called preferred sires. We believe that these form our most valuable records for from these we can determine what blood is the most valuable. Close linebreeding and inbreeding are being followed to a considerable extent. Considering the present rate of exchange good pedigree cows are selling around $700 and ordinary nonpedigree at $200."

With all of its agricultural prosperity, co-operation has developed to a wonderful extent since its beginning here 30 years ago. Nearly 70 per cent

Bull Club in Washington

The first work undertaken by Stanley V. Butchart as secretary of the Washington State Holstein-Friesian Association was the organization of a community bull club in the Chimacum Valley. Many breeders there have excellent foundation cows but because of their small herds have not afforded as good bulls as the cows should be bred to. This situation made the co-operative use of good sires essential to progress. When the matter of owning good sires together was presented to these breeders, they immediately saw the advantages of the bull club. Fourteen signed up 145 pure-bred Holstein cows, adopted a constitution and by-laws, elected officers, and set out to purchase their first co-operatively owned sire.

STANLEY V. BUTCHART

OFFICERS OF THE WASHINGTON STATE HOLSTEIN-FRIESIAN ASSOCIATION FOR 1921

From left to right, the men in the front line are Mr. John L. Smith, director; Thos. G. Lockhart, director; H. C. Davis, vice-president; F. S. Stimson, president; R. L. Rutter, Jr., treasurer; Wm. Bishop, director; and from the left, those in the second line are Thos. J. Owens, Alex Todd, Dr. H. K. Stockwell, and H. R. Schultes, directors.

Virginia Dairy Show and Creamerymen's Convention

The dairymen and creamerymen of Virginia held their annual conventions for 1921 in a joint meeting, at which time was staged the Virginia Dairy Show. The first day was given over to the Seventh Annual Convention of the State Creamerymen's Association. At the opening session there were seventy-five of the state's best creamerymen and milk distributors present to exchange views, discuss individual and state-wide problems, and to learn from the able speakers better methods of creamery operation for the betterment of one of Virginia's largest industries.

W. B. Liverance of New York delivered a most excellent address on the subject, "Co-operative Marketing". Everyone in the audience found a new idea and saw a larger vision of co-operative marketing after this address by Mr. Liverance. Other speakers on this program were, Miss Jessie Hoover, Specialist in the Utilization of Dairy Products, from the Dairy Division. She told of the value of city milk campaigns for increasing milk consumption. J. H. Meek, Director of the Virginia Bureau of Markets, lead in a discussion of marketing problems. C. W. Holdaway of the Virginia Polytechnic Institute lead in a discussion on buttermaking.

The Dairymen's Convention

The convention of the Virginia State Dairymen's Association began its first day's program with an address of welcome by John Wood. He was followed by President F. C Baldwin of the Dairymen's Association. He outlined the need for a change in the functions of the organization and gave specific plans for the proposed organization in the future.

"Feeding for Economical Production", was a subject presented by one of Virginia's foremost dairymen, F. S. Walker, a practical feeder, with many years of experience. Every one who heard this address found new ideas for improving their methods of feeding.

Governor Westmorland Davis briefly told the dairymen assembled of the importance of the convention, and of the need of more unity of action and co-operation in the industry.

Other important speakers for the first session of the convention were: T. B. Hutcheson, agronomist at the Virginia Polytechnic Institute, who made a very interesting address on the subject, "Crop Rotations for Dairymen". C W. Holdaway, Professor of Dairy Husbandry, Virginia Polytechnic Institute, addressed the dairymen on the subject, "Virginia's Experimental Dairy". Hon. A. B. Thornhill, commissioner of the State Dairy and Food Division, told of the accomplishments of this department and of its value to Virginia's dairy interests. Mr. J. A. Turner of Hollins College spoke upon the highly important subject, "What May Be Accomplished by Breed Associations". The first day's session was ended with a round table discussion, which was lead by R. H. L. Chichester.

The second day began with an address by R. E. Hunt, Professor of Animal Husbandry, Virginia Polytechnic Institute, on the subject, "The Selection of a Dairy Sire". Professor Hunt emphasized the necessity of "careful selection of the sire, because the sire is more than half of the herd." J. G. Ferneyhough told of the advancement in Virginia of the eradication of tuberculosis in cattle.

One of the features of the convention was a paper presented by R. H. L. Chichester, entitled, "The Building of a Pure-bred Dairy Herd". Judge Chichester began several years ago

to build the foundation of a pure-bred Guernsey herd. The results he has obtained in making great foundation cows are known throughout the dairy world and have added much to the importance of the Guernsey breed. "The Jersey Cow in America" was the subject of an address by Mr. MacMonnies, Eastern Editor of the Jersey Bulletin. He told of the past records of the Jersey breed, of the unfailing popularity of the breed and inspired every Jersey breeder to push toward the goal of higher production.

J. R. Hutcheson of the Virginia Polytechnic Institute told of the necessity for organization, the time to organize, and how organization may be perfected. T. E. McLaughlin, manager of the Maryland—Virginia Milk Producers' Association, explained in detail the actual working of a real live organization. At this time the Association is developing plans for operating a plant in the city of Washington, D. C., to take care of the surplus milk of members. "The Value of Farmers' Co-operative Organizations", was presented by W. N. Cease, president of the Producers' Exchange of Richmond. Mr. Cease told the audience of the accomplishments and value to the farmers in his county of the producers' organization which he represented.

Dairy Contests

In connection with the dairy show there were held three important state-wide dairy contests. A milk production contest was held while the conventions were in session. This was a 72-hour butterfat production contest. Five Holstein and two Jersey cows competed. The results were as follows: first, Summerdean Susanna, a Holstein cow owned by Dr. H. H. Trout, butterfat, 7.9687 lbs.; second, V. P. I. Dione Korndyke, a Holstein cow owned by Virginia Polytechnic Institute, butterfat, 7.0962 lbs.; and third, Netherland Hartog Queen, a Holstein cow owned by T. F. West, butterfat, 6.5123 lbs.

In the state-wide market milk contest, there were thirty-five contestants in the three classes. The winners were as follows: Class I, Fairmont Dairy, score, 95.0; Class II, E. V. Southall, score 97.9; and Class III, Blue Grass Creamery, score 90.0.

There were seventy-three contestants in the State Farm Butter Contest. The winners were as follows: first, Mrs. E. M. Beck, score, 90.5; second, Mrs. C. W. Bowles, score, 90; and third, F. C. Baldwin, score, 89.5.

The following officers were elected for 1921: president, F. S. Walker; vice-president, F. C. Baldwin; secretary-treasurer, F. A. Buchanan.

Virginia. F. A. BUCHANAN.

Complete County Organization

Marathon, the largest county in Wisconsin, claims the distinction of being the first county in the country completely served with a series of local breeders' clubs federated into a county organization. Sixteen different local clubs serving two leading breeds in the county, Guernsey and Holstein, have been organized and federated.

At Colby, early in April, 22 breeders met and formed an organization with as much strength as in the total membership in the old county organization plan. The present system is to organize a club so that every breeder is accessible to his local organization. Through frequent local meetings, interest in better cattle is stimulated, as well as interest in testing associations and advanced registry work. More high class sires have been brought into the country during the past fifteen months than at any other equal period. At present Marathon County's 6,100 farmers own 54,500 dairy cows. The present average production is 4,800 lbs. milk per cow. It is expected that the present improvement undertaking will increase this average.

Tuberculosis Eradication Conference

Plans are under way for the holding of a Tuberculosis Eradication Conference of state and federal veterinarians engaged in co-operative work in the New England States. This will be held with veterinary practitioners and representatives of the live stock industry in the Auditorium, State House, Boston, Mass., June 22, 23, 24. The program includes the names of prominent men in the United States and Canada who are interested in this project. Moving pictures and practical demonstrations will form a part of the program.

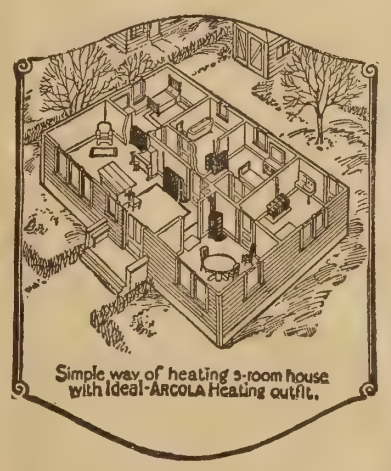
Ring Heather of South Farm, an Ayrshire cow owned by Glen Foerd Farm, Pennsylvania, has recently broken the breed's record for fat production in the junior two-year-old class and is the living champion for both milk and fat production in this class with a production of 15,093 lbs. milk, 700.64 lbs. fat.

She was bred by South Farm of Ohio. She was sired by Howie's Ringmaster, a son of Howie's Sir Hugh and grandson of Brae Rising Star—sires of outstanding individual merit, both having won the Scottish Ayrshire Society's champion cup for the best male at Ayr a number of times each. She is the daughter of Bonnie Heather of South Farm with a Class G record of 10,030 pounds milk, 428.43 pounds of fat, and a granddaughter of Bargenoch Bonnie Scotland with seventeen Advanced Registry daughters with official records that average 9,098 pounds milk, 365.09 pounds of fat as two-year-olds.

William T. Tonner, owner of Glen Foerd Farm, purchased this champion at the first National Ayrshire Sale in 1919 as a yearling to go with his select foundation herd, which consisted of the grand champion at the previous National Dairy Show, Canadian champions, and top quality imported and home-bred animals.

Babies and young children need warm homes. Protect their health and make them happy in a home that has even, hot water heat and give them a good start in life.

Ideal ARCOLA Heating Outfits



Keep the Boys and Girls on the Farm

WITH stove heat the farmer has no private life. The farm help, family and all must spend their winter evenings sitting in the one heated room around the stove. The farmer's daughter must entertain her company in the same room with the family and help.

But install an ARCOLA and heat all rooms with no more fuel than is needed to heat one with a stove. The help then may have their room, the family another and daughter may have a room to entertain her company and will not want to leave home to get the privileges that her girl friends enjoy who live in the city.

Reduced in Size and Cost

The ARCOLA is made on the same principle and with the same guarantee as our large IDEAL Hot Water Heating plants. The only difference is in the *smaller size* and *lower cost* of the outfit.

Simple way of heating 9-room house with Ideal-ARCOLA Heating outfit.

Lasts a Lifetime

The ARCOLA burns hard or soft coal, coke or wood. Never wears out or needs repair. Leaks no coal-gas—wastes no heat up the chimney. Absolutely safe—no fire risk! Running water not necessary as same water is used over and over again.

Ideal-ARCOLA Heating Outfits are especially designed for small homes, new or old, with or without cellars, and are sold by heating contractors everywhere. Investigate today!

Find Out Today!

Write for catalog showing open views of ARCOLA-heated 4- 5- 6- or 7-room cottages, bungalows, flats, schools and small business buildings. The Ideal heat for farm homes, ranch houses, chicken houses and central or colony hog houses.

EDITORIAL COMMENT

WITH NO EXCUSES

A refreshing bit of humor comes from Island Farm, Minnesota. In reporting the records of three new class leaders in that splendid Guernsey herd, Mr. Hartley pokes a bit of fun at the many excuses breeders are so prone to make in explaining why the records reported for their cows are not "world beaters". He says:

"We are going to let the records of these three cows stand without excuse or any prediction as to what they might have done had they not been severely bitten by vicious flies several times during the year; stood in rough hewn granite stanchions or fallen down a well, one on top of the other, during their seventh month on test, the most critical period. It is only fair to state that they were milked every once in a while and fed every week during their entire milking period. Captained by Hathaway, their milkers were four regular fellows, Bright, Hughes, Bemis, and Hill, who never severely beat them except when the boss was away."

ELIMINATING TUBERCULOSIS

Hinds County, Mississippi, is the second county in the United States to complete a county-wide test in a campaign for the purpose of eliminating tuberculosis from its herds. All of its cattle have been tested once and only 49 reactors, or about one animal in every 700, reacted to the tuberculin test. This shows a very small percentage of tuberculosis among the cattle of this county, making it comparatively easy to eliminate tuberculosis. Those in charge of this work should inaugurate rules making it impossible to ship anything but clean cattle into this county. Their problem is not one of eliminating tuberculosis but rather of keeping tuberculosis from coming into their county through purchased animals.

Some authorities have doubted the wisdom of attempting to eliminate tuberculosis from areas as large as counties. They question the final results. It is their opinion that the use of the intradermal test, and applying it to many animals at one time, gives opportunity for many errors and that, unless extreme care is taken in handling the work upon so large a scale, disappointing results are likley to follow. If those who have this work in charge believe a single test will locate all reacting animals and that their elimination from the county cleans up tuberculosis, disappointment is sure to follow. Eradicating tuberculosis is not a simple process; sometimes it takes years to wipe it out of a herd that is carefully handled, especially if a considerable percentage of the animals is found to be suffering from this disease. The work of cleaning a county of tuberculous animals will require constant effort, well laid plans carried out by constant and reliable men and in co-operation with the owners of the cattle.

FARM MACHINERY DROPS

In addition to the reduction in prices of certain classes of farm machinery announced several weeks ago, manufacturers are again announcing a further reduction. One concern makes a cut of ten per cent on all machinery not previously covered in their reduction, while another makes a cut of ten per cent on plows, cultivators, spreaders, disc harrows, corn planters, hay loaders, binders, mowers, sulky rakes, and other implements.

This last reduction is due to the lower prices recently announced for steel, which furnishes a new basis of replacement costs. The manufacturers assert that the present machinery is made from the higher priced steel and the new prices will represent a tremendous loss to them, but they are ready to take this present loss in the hope that the farmer may be better able to buy and so give employment to factory workers in manufacturing machinery of the lower priced steel.

The farmer will appreciate these reductions and his purchases will only be restricted by his lack of ability to buy due to the low prices he has received for his products and the difficulty of borrowing money. The dairy farmer has not been so badly hit as other farmers, and he may well consider the advisability of buying now both because he needs the machinery to lower his costs of production and because it gives work to the labor of the city that makes the large market for his products. We realize today, more than ever before, the interdependence of the farmer and the large body of food consumers in the city represented by the factory worker. Both need to be successful that either may profit.

SHOW CATTLE MUST BE TESTED

The action of a number of the larger state fairs and stock shows in providing regulations to prevent the spread of tuberculosis among cattle exhibited at their shows is to be highly commended. Breeders have been forced to take unreasonable chances with their tuberculosis-free herds in exhibiting at fairs and shows where diseased animals were permitted to be exhibited. This season the sentiment is so strong for strict regulation of this matter that it appears certain to be but a short time until the only cattle which can be entered at the major shows are those which are known to be free from this insidious disease.

Following the recent regulations of the Iowa Dairy Cattle Congress, comes a statement from the Wisconsin State Fair Board specifying what cattle may be shown at the Wisconsin State Fair and giving the following provisions under which cattle shall be cared for during the fair in order to further insure against the spread of tuberculosis:

Cattle from accredited herds may be shown. Those from herds which have passed an entire herd test within one year and which have not been with cattle not known to be free from tuberculosis may be entered. Cattle from herds having reactors in the first test but where the whole herd has passed subsequent test within six months of the removal of the reactors from the herd may be shown.

Owners of cattle, whose herds have not been tested in their entirety, must furnish tuberculin test charts of each animal, the date of test not to exceed 90 days prior to exhibition. Such cattle must not have been with untested cattle following the testing date. All charts submitted must be approved by state or federal officials and must be furnished to the secretary of the fair not less than 20 days previous to the opening of the fair. Animals entering the state fair grounds must be identified on tuberculin test charts by name and registry number or ear tag number. Common water troughs will not be used at the fair. Each exhibitor must provide water buckets for the use of his own herd only.

We trust that all exhibitors of cattle will appreciate the wisdom of these rules and will co-operate with the managers of fairs and dairy shows in carrying them into effect. Tuberculosis is so infectious and insidious that exhibitors of cattle cannot be too careful about exposing their herds to this disease.

PENNSYLVANIA BUTTER BILL

A bill has been introduced in the legislature of Pennsylvania to prevent fraud by prohibiting the maufacture and sale of adulterated butter. The bill requires that butter contain not more than 16% of water or less than 80% of fat. If butter contains more than 16% of water or less than 80% of fat, it is held to be adulterated and penalties are inflicted on those who violated this standard. The bill also provides that no foreign fat or starchy matter or other substances which affect the quality and purity of butter be added to it. The butter standard provided in this bill is in keeping with the ruling of the Internal Revenue Department which holds butter to be adulterated if it contains sixteen per cent or more of water. It differs in that the ruling of the Internal Revenue Department does not provide for a minimum amount of butterfat. We rather favor the double standard although there is little difference between that and the standard which requires butter to contain not less than 80 per cent fat.

The expensive and important part of butter is butterfat and if butter contains 80 per cent butterfat, there is little or no danger of its being adulterated. We rather like the bill introduced in the Wisconsin Assembly which provides for an 82.5 per cent fat standard, but permits a tolerance of 2½ per cent. No prosecution will be made unless the butter falls below 80 per cent fat. A law of this character is easier to enforce. A jury dislikes to convict a butter manufacturer if his product nearly reaches the standard set by law. It is likely to take the position that since butter varies in composition, some tolerance must be provided. It is better to provide the tolerance in the law and when butter falls below 80 per cent fat no plausible excuse can be offered to the court.

It is desirable that all dairy states have laws providing for uniform standards for butter. Any state that requires more than 80 per cent fat as a standard for butter handicaps its butter interests. It is important that we have standards to protect the quality of all products, to extend justice to the consumer, and to protect our dairy interests.

THE EMERGENCY TARIFF

The Emergency Tariff Bill, vetoed by President Wilson at the close of the last session of Congress, has repassed the House, is now before the Senate, and will probably be enacted into law within a few weeks. It is too late to be of great value to agriculture as a whole, as the 1920 crop has been largely marketed. Nevertheless it will benefit the dairy industry. We have one objection to this bill because it does not provide a sufficient tariff on vegetable oils. Last year vegetable oils replaced about 7,000,000 lbs. of fat in condensed milk and about 200 million pounds were used in the making of oleomargarine. It is unfair to ask the dairy farmers of this country to compete with the cocoanut cow of the South Sea Islands. Cocoanut oil does not contain the nutritious properties of milk fat and people who buy it are not receiving as valuable a food product as they are led to think.

We believe the 23,000,000 dairy cows in this country are of far more importance to the development of agriculture and the welfare of the people than the few thousand cocoanut cows of the South Sea Islands. The value of the cow to this nation can not be measured wholly by the returns of her product nor to the high nutritive value and importance of it in the human diet. Her returns are far greater than this as she makes it possible to build up agriculture and to follow diversified farming which in this time of readjustment has proven the most stable form of farming. She utilizes products of the farm and mills which would be wasted without her. Considering her relationship to permanent agriculture and the importance of her product as a food, we believe dairy farmers are entitled to a substantial protection from the vegetable oils of foreign countries. It is our desire to see the tariff on vegetable fats materially increased when the Tariff Commission reports its final tariff bill.

President Harding said in his address to Congress: "Today American agriculture is menaced, and its products are down to pre-war normals, yet we are endangering our fundamental industry through the high cost of transportation from farm to market and through the influx of foreign farm products, because we offer, essentially unprotected, the best market in the world. It would be better to err in protecting our basic food industry than paralyze our farm activities in the world struggle for restored exchanges."

President Harding is right in the attitude he takes toward protecting the agriculture of this nation.

Culture and Feeding Mangels

Please give me some information regarding the sowing, thinning, and feeding of mangels and sugar beets to dairy cattle. Should the green tops be fed and in what quantity? Should the whole beets and tops be fed during thinning out process?
Fowler, Ind. W. T. C.

Before planting sugar beets or mangels, see to it that cornstalks, roots, or stones, if any, and other foreign matter on the field are removed. The work of cultivation will be very much facilitated during the early summer months. Plant beets just as soon as the soil is warm and dry—about corn planting time. The earlier the beets are planted the more vigorous will be their growth. It is best to use the regular beet drill, but if that is not available, use a grain drill with spouts closed so that rows are planted from 22 to 24 inches apart. Mangels may be planted at the rate of eight pounds and sugar beets at the rate of 15 lbs. to the acre. Where only a small area is to be planted the hand drill may be used to advantage.

It is usually best to cultivate at least once before blocking and thinning. This can be done just as soon as the rows can be plainly seen across the field. Cultivate shallow and be careful that the plantlets are not covered with dirt. After the plants are up from two to three inches high, take a hoe about seven inches wide and block out the beets, leaving two or three inches of beets in each block. Then thin out to one vigorous plant in each block, leaving a plant every 8 or 10 inches apart in the row. This is the most important work in raising beets and should be done with care and on time. The condition of the beets and the evenness of the stand will, later in the season, show the care the beets have received and will also determine the success or failure of the crop.

After thinning, keep the field clean of weeds by frequent cultivation. This will hasten the early rapid growth of the plants so that the tops will cover the ground between the rows before the usual hot dry weather begins. The leaves keep in the soil moisture which promotes the healthy growth of the root.

From 30 to 40 lbs. of sliced mangels or sugar beets are satisfactorily fed to a cow daily. Roots furnish succulence and stand in the same relation when fed in the winter as grass does in the summer to live stock. As a tonic to the system and the aid they give in digesting other foods, roots cannot be overestimated.

Green tops of beets should be fed to dairy cattle in limited quantities and with care—say from 8 to 10 lbs. daily per animal. Good results follow when fed with a liberal supply of concentrates, such as wheat bran middlings or ground oats. It is not advisable to allow the cattle to gouge themselves on green beet leaves,—they get off feed. Beet leaves contain a large percentage of the mineral matter found in the plant and if fed too generously, an undue amount of labor is apt to be thrown on the action of kidneys of the animal and may cause injury.

We would not recommend the feeding of whole beets and leaves to dairy cattle at time of thinning. There is scarcely enough substance there to make it worth while. The plantlets, when left on the field, will easily decompose and make plant food wrapped up in them easily available for the plants left to grow later in the summer. J. F. WOJTA.
Wisconsin College of Agriculture.

Silo With Pit

I intend to erect a silo this year. It will be on the upper side of my barn and I intend to dig down a little below level of basement floor and build of cement to ground line, making a pit six feet deep, and then putting a stave silo on this wall. A salesman of a popular make of stave silo says the pit idea is wrong. Corn will not make No. 1 silage in cement. Is he right?
Edinboro, Pa. N. L. K.

A very large number, if not a majority of the farmers who erect stave silos, put them on top of pits anywhere from 2 to 8 feet deep. We see no objection to this practice except where the pit may extend blow the stable floor and cause additional work in taking out the silage. In many cases, however, the dairy barn is situated on something of a side hill and the pit of the silo is merely extended into the ground sometimes to 2 or 3 feet below the stable floor. It is not difficult to lift out silage to this height. The silage in the pit will be of like quality to that in the upper part.

This system of construction is very desirable because of its economy. There is no good foundation for the statement that silage will not keep well in such a pit. The stave silo salesman who tried to sell a silo upon such a basis as this is making a serious mistake. Silage acids will not destroy the cement providing it is given proper care and has been properly erected. All that is necessary is to whitewash the cement once in 3 to 5 years with Portland cement mixed with water to the consistency of cream.

Egg Contract

Can you supply a copy of a contract covering eggs between creamery and its patrons?
Belle Meade, Va. S. B. E.

The following is a contract that was in use by a Minnesota creamery some years ago and worked out successfully there:

"For the privilege of selling eggs to the creamery company and getting a market established for guaranteed fresh eggs, I hereby pledge myself to comply in every way with the following rules:

"I agree to deliver eggs at the creamery that will not be to exceed 8 days old and to be gathered twice every day. Eggs to be of uniform size, to be clean, and to be kept in a cool, dry cellar. Brown eggs to be put in one carton and white in another, and so marked. Each egg to be stamped on the side, and carton to be stamped on the top.

"I agree not to sell any eggs that I have marked with the creamery company's trade-mark to anyone else but the creamery company, and to return stamps and other supplies that have been furnished, in case I should decide to discontinue to sell eggs to the creamery company."

It might also be well to incorporate the following:

1. Patrons to deliver all eggs produced by their hens except those used in the home and those from stolen nests of unknown age.

2. All eggs shall be infertile eggs except during spring breeding season.

3. The creamery maintains the privilege of refusing dirty eggs and those which do not come up to the standard.

We would suggest that those interested in this subject write the U. S. Department of Agriculture, Washington, D. C., for copies of Farmers' Bulletin 445 entitled, "Marketing Eggs Through the Creamery", and Farmers' Bulletin 656 entitled "The Community Egg Circle".

Millet Hay for Cows

I want to sow some millet this spring and would like to know of its value for milk cows against other hay. Is it better than timothy or wild hay? What would be the best time to seed it?
Gibbon, Minn. R. V.

Millet hay does not make a very desirable feed for milch cows. It is probably not equal to timothy hay but if fine stemmed, it is probably superior to marsh hay or wild hay. It is a better crop for dairy cows when ensiled than when cured as hay, particularly if the stems are rather coarse.

The particular adaptability of millet is the fact that it can be sown as an emergency hay crop after corn has failed or some early crop has been taken from the field. The common Foxtail millet is usually regarded as the best variety for hay, although the German, Hungarian, and Japanese varieties may be used. The Foxtail millet is finer stemmed and earlier, both of which are advantages in a hay crop. From 3 to 4 pecks of seed are used per acre. The seed is either broadcasted or drilled in, but care should be exercised not to bury it more than an inch deep and less than this is preferable in a stiff soil.

Like sudan grass, millet requires a warm soil and is not planted, as a rule, until late in June or early in July. If allowed to mature, the plants rapidly grow woody and strawy. It should be cut when the heads are well out but before they reach maturity.

Clarifying Milk

I use a wet muck pasture in the summer and after taking all the precaution possible and using the so much advertised Clark strainer I cannot make clean milk. Will a clarifier remove all this sediment and muck without affecting the keeping quality of the milk?
Wauregan, Conn. P. J. C.

The best protection against dirty milk is to carefully wash and dry the udder of the cows before milking. It is much to be preferred to keep dirt out of milk rather than to attempt to take it out.

The clarifier will be of great assistance in removing sediment which may get into milk, but it is doubtful whether it will remove all of the fine particles, such as come from milking cows whose udders are covered with mud. Clarified milk will keep quite as well, if not better, than milk which has not been passed through such a machine. The clarifier itself is not essentially different from the separator except that it does not separate the cream from the milk.

Soy Bean Meal

What can you say about soy bean meal for cows on test?
Staatsburg, N. Y. H. E. S.

Soy bean meal made from the residue after the oil has been extracted carries as much digestible protein as choice cottonseed meal and slightly less carbohydrates and fat. Although high in price, soy bean meal is greatly esteemed by western dairymen and is often fed in relatively large amounts to cows on official test. In certain feeding experiments, it has been found slightly superior to cottonseed meal while others have found it practically equal to the better classes of linseed oil meal.

It is not a meal, however, that has been used to any considerable extent in the United States and is more often used, perhaps, in the form of ground soy beans than in meal made from the residue left after the oil is extracted. As the ground soy beans contain a considerable amount of oil, the meal should not be stored in very large quantities for it is inclined to turn rancid. We have comparatively few reports of its use and are unable to advise from our own experience concerning its particular value in official test work.

Variations in Test

It would be very interesting to me if you would let me know if the butterfat in the milk of the same herd of cows can drop from 5% to 4% and then after awhile go up again to 4.8%.
De Lancy, N. Y. A. P.

It is possible for the average fat test of a herd to decline from 5 per cent to 4 per cent and return again to 4.8 per cent. Such a fluctuation is very unusual and must be explained by some marked change in the feeding or management of the herd. For example, we have seen a herd decline in fat test even more than this when turned from a heavy grain ration in winter feeding to a succulent, watery green crop, without permitting the herd to become used to the feed by gradually increasing the quantity day by day.

Especially would the fat percentage be apt to decline markedly if a herd has suddenly become chilled through standing in a cold rain or through some other circumstances which will throw it out of its usual condition. If no such factors as these have come into this herd to affect the test, we would give immediate attention to the matter of the testing of the milk to make certain that some error has not occurred there.

Powder Milk Process

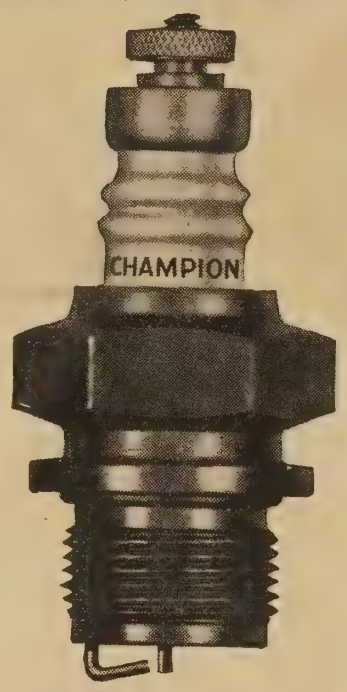
Kindly give some information about powdered milk by the economic process. Is it a success and is the market good for the product? What is cost of installing a plant to handle, say, 40,000 lbs. daily? Are there any other processes besides the above?
Calgary. INTERESTED PARTY.

Professor O. F. Hunziker gives us the following reply to the above inquiry:

"I am not aware of the existence of a process of making milk powder called the Economic Process. There are only three systems whereby milk powder is made, namely, the Dough Process, the Film or Roller Process, and the Spraying-drying Process. These processes are explained in detail in the Third Edition of my book on Condensed Milk and Milk Powder.

"It is quite possible, of course, that any one manufacturer or patentor may have given the name Economic Process to his particular process or patent would not differ in any essential from one of the systems mentioned above.

"The cost of a plant to handle 40,000 lbs. of milk daily would vary very greatly with the system of drying used. In the case of the film or roller process, where it is usually not necessary to condense the milk before drying, the cost of installation might be considerably lower than in the case of the spray-drying process where, in most cases, condensing equipment has to be installed as well as the drying equipment. I would say that you would have to figure on about $75,000 to $125,000. These figures are exceedingly approximate. I merely mention them to give somewhat of an idea of the possible expense."



Champion
Dependable Spark Plugs

THE users of Champion Spark Plugs have really made the reputation of "Champions" for dependability.

They realize that "Champions" are continually giving the highestsparkplugvalue, —the greatest service, —for the least amount of money.

Champion indestructible "3450" insulators, and patented copper asbestos gasket construction, guarantee absolute spark plug dependability.

Breeders Discuss Tuberculosis

S. R. WINTERS, DISTRICT OF COLUMBIA

A QUESTIONNAIRE, supplemented by a letter emphasizing the benefits derived from the accredited herd plan in the suppression of animal tuberculosis, distributed by the U. S. Bureau of Animal Industry to 15,000 live stock owners, has brought 5,000 responses. The object of the searching inquiry was to consult opinions of veteran cattlemen as to the value of tuberculin testing and assemble their individual experiences into collective form as a fund of ready information for others in the tuberculosis eradication campaign.

The inquiry sought data on nine particular points, the outstanding queries being: "In your judgment, what is the most common method of spreading tuberculosis in your community?" "Do you think it would be a wise provision to have separate sections at live stock shows, so that accredited herds and herds in the process of accreditation may not be exposed to cattle that are not in such classes?" "Are there any creameries, condenseries, or skimming stations in your community which return to farmers by-products to be fed to swine and calves; if so, are the by-products pasteurized properly?" "Is the sentiment among the live stock owners in your community favorable for the eradication of tuberculosis?" and "if you have any criticisms of the tuberculosis eradication campaign to make, or suggestions to offer, for improving it, the Bureau of Animal Industry will appreciate the receipt of such advice."

To Dr. J. A. Kiernan, chief of tuberculosis eradication division, the outstanding conclusion of the sweeping answers to the questionnaire is to this effect: That while owners of accredited herds desire to maintain cattle free from tuberculosis, they do not think it fair for other herd owners to be permitted to maintain animals, the health conditions of which are unknown, but in some instances it is known that tuberculosis exists in these herds. Likewise many owners of accredited herds take serious objection to the privilege extended to untested cattle of being exhibited at live stock expositions, and stabled in immediate contact with animals free from disease. Doctor Kiernan thus summarized the unmistakable sentiment of dairymen and cattlemen the country over as they voiced their expressions on written forms that are banked high in the office of the chief of tuberculosis eradication division. His comment is illuminating, and the writer delved into the replies for additional interesting details and specific criticisms.

Expressions favoring compulsory tuberculin testing were numerous, a condition which is discouraged by the Bureau of Animal Industry. Educational methods rather than arbitrary rules seem to be the policy of the federal authorities. Farm auction sales, the mingling of cattle at expositions and county fairs, feeding whey and skimmilk from the factory and creamery, and contaminated water in stock tanks, are among the common causes ascribed for the dissemination of tuberculosis. Wisconsin and Michigan, foremost in pledging support to the accredited herd plan, were more generous than other states in responding to the questionnaire, each of which filled out approximately 500 of the form blanks. The batch of replies from Wisconsin was especially liberal in supplying the requested information, many letters being appended to the returned questionnaire. Many individual comments are of such interest as to permit of brief reference thereto:

George C. Humphrey, of the University of Wisconsin, declares that the most common method of spreading tuberculosis is "the exchange of dairy cattle". By way of comment he says, "Undoubtedly, it will be a better plan to eliminate cattle that cannot show clean bills of health." S. M. Krippner, of Barron County, blames the method of "selling tubercular cattle to your neighbors," as being responsible for the unchecked evils of tuberculosis. A Holstein-Friesian breeder in Winnebago County is critical of the practice of feeding whey and skimmilk from factory and creamery, while a Waupaca County breeder ascribes the reason for the spread of the disease to "pasturing cattle where they can lick other cattle across fences." Julius Haag, Fond du Lac County, writes, "I do not know whether there is any tuberculosis in my neighborhood as I am the only one that had the cattle tested."

A Shorthorn breeder recommends the barring of all doubtful animals from show grounds. "I believe a law should be passed and enforced prohibiting a farmer from having a public sale unless he had his herd tuberculin tested within thirty days," writes an official of the La Crosse Guernsey Breeders' Association. And, finally, from the symposium of replies how refreshing is this one from Eau Claire County: "Tuberculosis is the least of our troubles."

The chief of the tuberculosis eradication division of the Federal Bureau of Animal Industry appraises as of far-reaching significance the recent action of the executive committee of the American Jersey Cattle Club to the effect that after 1924 its organization will not award prizes save to animals in accredited herds. The Holstein-Friesian Association is said to be entertaining the advisability of taking similar steps. Pertinent to the strengthening of the methods of combating animal tuberculosis, the Bureau of Animal Industry recounts that for the present fiscal year the States will have an aggregate of $4,000,000 for controlling the disease. Congress has appropriated $2,000,000 for disbursement by the federal government, $1,000,000 for idemnity, and a similar sum for operating expenses.

The Bureau of Animal Industry reiterates with emphasis the economic losses sustained by this animal disease: "The animal losses in meat products caused by tuberculosis are enormous, and every effort must be made to diminish the constant drain upon the industry. During the fiscal year terminating June 30, 1920, there were retained for tuberculosis at the federal meat inspection establishments 4,260,720 swine and 201,461 cattle. All of these carcasses were not condemned as unfit for food, because the lesions in many of them were very slight; but the fact that more than ten per cent of the total swine slaughtered under federal supervision showed tuberculous lesions is sufficient to cause a great deal of apprehension on the part of the leaders of the live stock industry of the country. This condition cannot be improved by worrying over it or talking about it. It will have to be remedied by eradicating the disease. If we are on the right track, we should pursue our efforts vigorously, with the hope of eventually eradicating tuberculosis.

"At the outset of the campaign there was very little said about the effect of live stock tuberculosis on public health. Emphasis was placed upon the economic importance of

eradicating the disease, but as the work was expanded in the field, it was found that the public was interested in learning the extent to which tuberculosis of cattle was transmissible to human beings. The Bureau has received reports from many states, advising of cases of tuberculosis among children on farms where the cattle were found to be extensively affected with tuberculosis. This subject has been carefully investigated by various commissions in different parts of the world, and uniform conclusions indicate that children under five years of age are quite susceptible to tuberculosis of bovine origin, the infection being carried in the milk from tuberculous animals. The percentage of tuberculosis of bovine origin among children over five years of age and adults is smaller. The outstanding fact is that where milk from tuberculous cattle is being fed to children, there is great danger of their contracting tuberculosis; therefore, the program for the extermination of tuberculosis of live stock must take into consideration its effect upon the public health, as well as the monetary losses sustained from the disease."

Hinds County, Miss., Tests All Cattle for Tuberculosis

The cattle of Hinds County, Miss., are practically free from tuberculosis. Following a vote of citizens in the county to eradicate the disease, the project of testing the cattle for tuberculosis was recently completed. The tests required approximately 65 days. During this time 3,992 herds containing 35,752 cattle were tested by veterinarians in the employ of the state and the United States Department of Agriculture, Bureau of Animal Industry.

The tests disclosed the fact that the cattle of Hinds County are comparatively free from the disease. Only 49 reactors were found, which is equivalent to slightly more than one animal in each 700. However, in addition to the 49 tuberculous cattle disclosed by the test, 53 had been removed several months before as a result of accredited-herd testing.

Cost of Campaign 21 Cents Per Head

Owners of cattle in Hinds County have the satisfaction of not only knowing that their cattle are free from tuberculosis, but also that this fact was ascertained at a cost for the entire campaign of 21 cents per animal. This includes salaries, expenses, and cost of transportation of veterinarians engaged in the work. Since the total cost of testing was borne by the Federal Government and the State, the live stock owners were put to no expense except the cost of disclosing of reactors.

All of the cattle which reacted to the tuberculin test were either slaughtered locally or shipped to New Orleans, La., where they were slaughtered under federal inspection.

Combination of Tests Used

The intradermic test which was used in combination with the ophthalmic accounts largely for the relatively small cost of testing. It enabled one veterinarian to test as many animals as the time required for observation would permit. Eleven veterinarians handled the entire work, and at times during the testing nine veterinarians were enough. Local sentiment, which resulted in the county-wide testing, was largely the result of educational work and suitable publicity. The superintendent of the state tuberculosis sanitarium, the secretary of the State Anti-Tuberculosis Association, and the local press assisted materially in the work.

The cattle of the city of Jackson were injected in one day. This was possible by having them assembled at five different places and, of course, returned for observation at a later date. When the testing had been completed in Jackson the veterinarians were stationed at points throughout the county. A form furnished by the Live Stock Sanitary Board was used for notifying cattle owners of the time and place they were to assemble their animals for the test. Very seldom was it necessary to drive any cattle more than 1 mile. That the test was generally appreciated was shown by numerous inquiries by owners who wished to find the location of the veterinarian in order to get their cattle tested as quickly as possible, not desiring to wait their turn.

Herds Containing Reactors Will Be Retested

The few herds in which reactors were found will be tested again in about six months. In this way every reasonable assurance will be given that the county is free from tuberculous cattle. Tuberculin testing on a county-wide scale is known as "area work," and is considered to be an unusually effective manner of eradicating tuberculosis permanently. Hinds County, Miss., is the third county in the United States to have completed such work, the others being Clay County, Miss., and Barron County, Wis. In all cases a large majority of voters were in favor of making the county-wide tests. Since most cattle owners and residents of counties where complete tests have been made realize the importance of tuberculosis-free herds, little trouble is anticipated in keeping animals affected with the disease out of the areas.—U. S. Department of Agriculture.

Easiest to Operate and Clean!

This in a nutshell is the story of the single-unit

HINMAN MILKER

So simple that boys and girls can and like to use them.

Drudgery is banished. Little to do but watch the Hinman do the milking.

Vacuum is in valve chamber in the cover so pails can be changed any time without stopping the milking. Just lift the cover to see flow of milk and when it is finished. Hinman gives Free Valve-Chamber Service during the long years of service rendered by every Hinman machine and 50,000 are making daily profits for their owners.

If you have 6 cows or more, a Hinman will pay big in dividends. Write for catalog—and with it we will include copy of "The Hinman Handshake" that gives facts you'll like to have.

We also make Electric Milkers with 1-6 H.P. motor operating on alternating or low voltage current. No installing.
